Water: filtering, 824; gate (R. O. Allsop's design) 864
Weekley hospital, 238
Wern house, Tremadoc, additions to, 698
West End mansions, inlaid furniture from, 881
Westergemeinde church, Altona, pulpit, 468
West Hartlepool, St. Aidan's church, 500
Westminster: abbey, three interiors of, 8; Guildhall, 830
White, William, portrait of, 8
Wickham Lodge, Egham, new hall, 864
Wimbledon Hill, L. and S. W. bank, 370
Wimboldsley, two allotment cottages, 813
Wingfield sale, sketches at the, 370
Withdeane Court, Sussex, lodge at, 468
Woking, Christ church, 732
Wood carvings of the Passion, Stalshund ch., 130
Wortley, New, Leeds, Wesleyan school, 77
Wreath, Clarence, Venetian glass, 167
Writing-table, 881

YAMINA, house of King of Sego, 336
Yeomanry drill hall, Bolton, 764
Y.M.C.A. building, Cork, 170
Yorkshire college, Leeds, 634, 651

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

MUNICIPAL BUILDINGS.

GROWING and active municipalities who do not like to be behind other towns are alive to the necessity of erecting commodious and handsome structures for the conduct of their civic duties and judicial administration. The stimulus of example has materially helped the movement of which we speak. Cities, like individuals, do not like to be left behind in the adoption of improvements—whether they be in the formation of new streets and parks, or in the erection of public buildings. Of course, a handsome town hall appeals to the ambition of mayor, aldermen, and burgesses; it proclaims the importance of their functions, and signalises their tenure of office. We cannot wonder that the growth and enterprise of great municipalities have been identified with the erection of great cloth and town halls, like those of Ypres, of Brussels, and Bruges, with their noble belfries; or those of Italy known as Brolettos, of which the town halls of Padua and Cremona are examples. The municipal palaces of Belgium, including town halls, courts of justice, and the trade halls and guildhalls, are famed for their grandeur and picturesqueness, and are worthy monuments of the commerce and manufactures of that country during the Middle Ages. Turning to our English cities, a similar, though less conspicuous, regard for great municipal buildings is noticed. Macaulay gives a graphic description of the growth of English towns and the splendour of a few of them since the Restoration. Bristol, he tells us, was the first English seaport, Norwich the first English manufacturing town, and he goes on to picture these cities and many others which have since grown to enormous wealth and influence in the commercial world.

That the chief magistracy and administrative authority of a town should seek to clothe their functions in a building appropriate and representative is very natural, and, therefore, in every municipality the greatest building next the cathedral or the parish church is the guildhall or municipal offices. Cities and towns like Manchester, Glasgow, Liverpool, Bradford, Birmingham, Leeds, Ipswich, Yarmouth, Wakefield, Burnley, Halifax, Portsmouth, Sunderland, and Sheffield have erected buildings worthy of their importance, alike representative of the prosperity of these great centres as they are of modern architecture. Indeed, if we were asked where modern architecture is to be seen, or in what direction it has associated itself with modern ideas and progress, we should point to our great civic buildings, palaces of justice, and legislature. From ecclesiastical, the stream of architectural art has flowed to secular buildings. The greatest competitions of the last two decades have been for municipal buildings. Many of the most eminent and successful members of the profession have won their reputations by competitions for them (one name, that of Mr. Alfred Waterhouse, R.A., being conspicuous), and it would be very instructive to turn our attention to a few of these triumphs of architectural art. On the whole, we have few buildings to compare for architectural planning and design with the Manchester Town Hall and the Glasgow Municipal Buildings, conceived in opposite styles, but equally worthy of the architectural genius of the age. Between these examples come a crowd of civic structures, which would take an article itself to enumerate, many of them showing power in plan and external design, and we have only recently chronicled or illustrated those of Sunderland, Sheffield, Bath, and a few other places. Such an examination of what has been done would be interesting; but we now refer to a few of the points in municipal-building design which are worth attention by those interested in future competitions, and to some causes of failure in the past.

First, as to site. The position and environment are important, and corporations who are thinking of erecting a town-hall and public offices should, before preparing to advertise for designs, consider well the advantages or disadvantages attending a certain site. How many buildings of this kind are sacrificed by being situated between narrow streets, where access to the main departments is rendered difficult or impossible! Manchester, Birmingham, Leeds have spacious and accessible sites, centrally situated. The sites for the new buildings at Sheffield and at Bath are well selected, and direct and separate approaches are obtained for the chief departments, such as the accountants', water, police-court, and public hall. The obvious advantages offered by a site which is isolated or surrounded by streets are so many that authorities would do well to pause, or postpone the erection of municipal offices till such a situation can be found. Very often intended street improvements offer a splendid opportunity for making a site. For instance, at Newcastle, four different sites have been proposed, the Eldon-square area offering a unique opportunity for making a great improvement; but we fear the city council will for the present content themselves with tinkering up the existing inadequate and incommodious building. Irregular, triangular, or quadrilateral sites, as those of the Town Hall, Manchester, and of Sheffield Municipal Buildings, cannot be avoided; but building committees and assessors, who prepare plans and conditions for architects should endeavour to avoid the serious drawback of obtuse and acute angles in the main façades. Mr. Waterhouse accomplished the problem of how to make the best of a triangular site in his Manchester Town-hall with considerable ingenuity. At Sheffield the main fronts to Surrey and Pinstone-streets were set to a square angle in the premiated design, and the main façade has square returns at each end. In the quite recent designs for the Bath Municipal Buildings, the competitors have differently understood the plan of site. The acute angle between High-street and Orange-grove, joined by a quadrant, shown in the site plan, has been followed by far the greater number of competitors, including the author of the premiated design. The designs of "Lex," "Progress," "Three Horseshoes," and one other only show a departure, their authors evidently coming to the conclusion that it would be better to sacrifice a little space and make the principal corner towards the Abbey church square, than to follow that very doubtful precedent of a rounded corner, one that has always been a bugbear to the architect. Where a building or frontage line is laid down, there should be a clear injunction how far it is to be followed, or the actual line should be defined. In this instance competitors have evidently considered the dotted line meant the actual frontage line, except in the few instances named. The "give-and-take" principle is not always a safe one in the hands of competitors, and perhaps the safest direction is to show by dotted line the external limit of land all round, allowing each competitor to use his own discretion in setting back within this line, making this meaning perfectly clear.

Another point is the programme or scheme. It is sometimes usual to set this forth in a "sketch plan" prepared by the corporation surveyor. We have always entertained doubts about the desirability of a sketch plan. Even if it be offered as a mere suggestion, it is too often blindly followed to the detriment of the author's design; if it is to be observed it is a serious restriction to independent effort, and excludes many more able solutions. On the other hand, a prepared scheme prevents ill-directed effort, much loss of time, and may suggest the only desirable division of departments. Probably a scheme such as that adopted by the Bath Town Council, and formulated by Mr. Young, the assessor, in his report in writing, is sufficient to prevent waste of labour, pointing out where increased accommodation is to be given, and where certain approaches or access of light are necessary. Should there be certain positions for the municipal offices or for particular departments like the rate office, the sanitary, the police cells, and court, the public hall, the council chamber, that are desirable, and only known to local officials—these should be pointed out, also the entrances and staircases, and best lights and aspects.

It is remarkable how many fall into errors if no guide to accommodation is given. Hence the value of approximate areas or dimensions, especially for the magistrate's court, sessions court, council chamber, and public hall. Where assessors are appointed to advise a committee, these areas are generally given. Another equally important instruction is to state how many and what rooms are to be connected with, or be attached to, each official department. Thus it is important to know how many offices are to be provided for the town clerk and borough surveyor and treasurer, the inspector of nuisances, of weights and measures, how many persons or officials are to be provided for in the council chamber, and what rooms are necessary in connection therewith for the mayor, and how many committee rooms should be provided near the chamber, and, if possible, in connection thereto. Again, to the court certain rooms ought to be attached for the magistrate and judge, for witnesses, for juries, and for those engaged as barristers and solicitors. Many of the plans we see for offices are weak in providing the necessary rooms and offices to each special department, or if they are provided, they are not conveniently placed. Those who have had anything to do with municipal business know the importance, for instance, of having one or more committee-rooms near to and entering directly into the council chamber, and of having the town clerk's offices not far off, as well as convenient to, the main entrance.

One of the neglected points of otherwise well-conceived plans for municipal buildings is the means of extension. Public offices quickly outgrow the provision made for them—new offices are required for extended powers of administration. The growth of the municipality necessitates a larger council chamber, magistrates' court, and public hall. Many very perfect plans are without the means of enlargement. We may instance the Leeds Town Hall, which has been found inadequate to the requirements, the Bath Guildhall, and several other buildings. Unless there is room for extension, the difficulty of enlarging is almost insuperable. The site should be therefore sufficiently large to enable future accommodation to be added. At Newcastle, the requirements have quite outstripped the accommodation of the old building, and have rendered reconstruction imperative. At Leeds the town-hall was found too small, and galleries have been found necessary at the end and sides. For half our recently-built town-halls it will be almost impossible to make any extension, as the halls and courts are sometimes packed in between offices or bounded by streets. In new plans it is worth while, therefore, for both authorities and architects to provide room for extension, either lengthwise or laterally, by placing the hall and the courts next to an area large enough for the purpose, or, as in the central hall at Manchester, with an open space round it. Again, it may be sometimes possible to build round the old Guildhall, as they intend to do at Bath, where the sessions court, council chamber, and banqueting hall will be retained, and wings added to contain additional courts and council chamber and new offices; but in many cases additions are out of the question, and involve a remodelling, which is costly and at best unsatisfactory. We might raise other points. The style of buildings is one of the important questions which has to be decided by circumstances and surroundings. The traditions of a town have to be observed; but there is one almost as important a question about which corporations seem a little diffident—we mean the internal decoration of town halls. There is no class of building upon which appropriate embellishment may be more fitly bestowed. Unfortunately, the cost of building is often prohibitive of anything like sculptural and internal decoration; but in selecting a design the civic authorities should provide for the suitable adornment of friezes and tympana, and by mural painting in the great hall, council-chamber, and courts. At Glasgow, Mr. William Young succeeded in persuading a corporation famed for its parsimony to carry out a well-thought-out and complete scheme of statuary and carving by indicating it clearly in his original competition drawings. In the great civic structures of the Continent, and in recent edifices like those of Vienna and Brussels, no expense has been spared to render the town halls of those cities monumental to a degree which leaves English municipalities a long way behind.

PROFESSIONAL AND ARTISTIC ARCHITECTURE.

TO what extent a building is the actual work of the architect—or, in other words, how much of it is due to him, and how much to those who are engaged in its construction, is a question of some importance in deciding whether architecture, as now practised, is a profession or an art. It is not a matter that concerns the public, who only look at results, and do not care a straw about a question that so little affects them so long as they get what they want. In one very practical sense a building is not the work of the architect at all. He has no part in the handiwork or execution which is intrusted to others, for though he may have designed every detail of the building, the real, executed work may fall very short of the design. In this sense the architect is placed at a very decided disadvantage with the sculptor or painter. Every detail must be intrusted to the hands of a workman who may have little or no sympathy with art; secondly, he is out of touch with the designer, whose aim and intentions are unknown to him. But in another sense the identity between the art of the architect and the real building is lost or destroyed by the system of introducing a third party, the contractor, who is in the position of the middleman. By this system the design has to pass through other hands, which renders it often impossible to trace the original authorship in the building actually carried out. We often notice how different the executed building looks, compared with the original design. We should not know it to be the same. The design on paper or in the illustration published is artistic, the executed building a sorry travesty. The paper details are boldly suggestive of relief: there is solidity, depth of reveal to all the windows, the pilasters are pronounced, the cornices strongly marked; in the actual structure these details look flat; the projections are superficial and "skin-deep." In the design there is life and vigour; in the real building the appearance is lifeless and vapid. Well may the architect who feels the importance and value of art declare modern architecture to be a "business" only, when the real structure is so painfully disappointing and so unlike the design.

Can we be surprised at the doubts expressed as to whether architecture is an art or a profession when we find so great a gulf fixed between art and practice, that those who profess the art of design should be satisfied with such very poor results of their labours, and in fact, permit the contractor's ideas of art to be substituted for their own? The architect is to some extent answerable for this, for he can design something less expensive, rather than allow his design to be robbed or shorn of its intention, as, for instance, in the cutting down of projections, the reduction of thickness and sculptural relief. To reduce cost by cutting down the price without at the same time modifying the design is a common and most injurious practice adopted by many professional men. Starved and meagre results are sure to follow.

But a system which encourages the production of speculative designs without reference to execution, which deputes to other hands the preparation of a drawing for a building, which disregards the craftsman and only deals with the contractor as a commercial intermediary—is one which completely dissociates the architect from the building. The system has grown naturally out of the modern idea of architecture. Mr. Leopold Eidlitz, in his "Functions of Art and Architecture," very truly points out that the study of architectural styles has only resulted in a sort of pictorial knowledge of architecture, not a knowledge of it as a living art. He says: "The reason is that the study of styles is pursued as an inquiry into forms instead of as an inquiry into the *causes* of forms"—a proposition we have more than once enforced in these pages, though architects have not yet realised the truth of this dictum, nor are likely to do so, so long as they think that art can be taught independently of the co-operation of the craftsman. The teaching of art, then, has favoured the distinction between architecture as an art and architecture as a business or agency. It has created such empty phrases as "art-furniture," "art-ironwork," "art-fabrics"—products of men who only know art through the introduction of a sort of fashionable dilettanteism. We have been told by one who worked nobly and diligently in the truest interest of architecture, that the birthplace of art was the workshop, not the drawing office. The late Mr. John D. Sedding was a sedulous worker, and did not disdain to associate himself with craftsmen and artists of all materials.

When art is studied rationally, as it once was, when the *cause* of this or that style or form is discovered and analysed, so that architects may again understand the true principles of design, and how it is to be practised, the present attitude of the profession towards the workman will be changed also. Academicism has crushed life out of art, and has given us the husks instead of the germs. Schools and congresses and lectures have abounded just in proportion to the emptiness of art. We have been patronising art fashions instead of learning what to do, and how to work. Architects have fallen under this blight; they have been learning "professionalism" during the last 300 years; how to exist and earn a living apart from the builder and workman; to take as many commissions as they can regardless of the time and labour they can spare to each, and to pose as gentlemen artists and general agents. Many have endeavoured to keep up the tradition of professional men as observed in other callings: to exalt their services; to ignore all contact with workmen and the actual building operations, and to only do the genteel part of the business. The attitude thus assumed has drawn into the profession a large number of men who ought to have followed other businesses or callings—who are anything but artists, and more competent as agents. We hear of so-called architects—but who are really estate agents—undertaking to "supply designs"; who, in fact, treat architecture as a vicarious business, employing a draughtsman or another architect to make designs for them, no matter for what it may be. If academicism has rendered art inert, mere professionalism has made it lifeless. Our need now is to check, as far as possible, this tendency. Something may be done by discouraging those students who have no aptitude for art, from following architecture as a profession. We have plenty of institutions which undertake to make architects, to instruct them in science and business, and then turn them adrift. The Association has undertaken to supply all the instruction needed, both in classes and studio, to make the "constructor" and the "man of business"—to use Mr. MacVicar Anderson's definition of two of the classes of the Institute—but it does not undertake to make the artistic architect. The result of these aids will be the introduction into the profession of the "business" element, which has been so much deplored. We are almost inclined to agree with Mr. H. Wilson in thinking this gigantic scheme of education would create "a set of professional prigs, a set of business agents—men who were qualified to have the superintendence of a factory, but nothing more." These facilities are valuable for those who have the gift; but for others the effect may be detrimental. French academicism has acted like a frost on art: it has quenched individuality, and the same will be the result if students rely too implicitly on the school and the office, and imagine that proficiency in the art is to be measured by the rules of surveying, legal knowledge, or sanitary science. The branches are valuable in the practice of the architect; but there is a danger that expertness in these things will be thought sufficient to make an architect. The same with draughtsmanship: the most dexterous drawing and perspective, and the study of models must not be mistaken for the power or aptitude to design. A man may be skilled in styles and details and yet be unable to make an original design for any building.

We are just now beginning to formulate a system of architectural education; but there is a risk that a "cut-and-dried" programme, a kind of Procrustean formula, will take the place of a truly educative process. As some one pointed out the other day, there is such a thing as "Institutism" becoming injurious. There is no practical distinction between Fellows and Associates, although there ought to be some preference attached to the former title; but as a matter of fact many Associates of the Institute are more competent men than their seniors; at least, there is no art-distinction, as there ought to be. Again, in the examinations of the Institute each candidate is supposed to go through the same studies, whatever his aptitude or inclination; he has no choice in determining what he would like to be examined in. How can we expect the highest results from this process? We have here endeavoured to point out some of the means by which architecture as an art is likely to be checked. It would be more rational, and would put a desirable limit on the number of those who seek to enter the profession, if every candidate could be proved to possess some taste for design before being admitted as a candidate for examination. One chief weakness of an indiscriminate test on subjects that bear only collaterally on architecture is to increase the number of men who possess the scientific and business capabilities, but who have very little sympathy with art in its higher aspect.

THE INSTITUTE'S SUGGESTIONS FOR THE CODIFICATION AND AMENDMENT OF THE METROPOLITAN BUILDING ACTS.

THE "Suggestions for a Draft Bill for the Codification and Amendment of the Metropolitan Building Acts," prepared by the Practice Standing Committee, and adopted by the Council of the Institute of British Architects, covers the whole ground of the Acts and By-laws in operation. Several suggestions are made which may be usefully considered: one is, that details of construction, which are subject to variation from time to time, such as new inventions, new materials, or modes of construction, should be placed in schedules attached to the new Act, power being given to the County Council and to the Commissioners of Sewers to vary these as occasion shall require, the object being to allow of change in details, without the necessity of going to Parliament. It is suggested further that the new Act should be "confined to, and extend to, everything within and inclosing the curtilage of a building, including any vaults under a public way"; also sanitation (*i.e.*, drainage, air spaces, ventilation, plumbing, &c.), and regulations respecting lines of frontage. Roads, sewers, and bridges, and everything in the nature of public thoroughfares should be excluded; also rights of light and air, which are matters of private property, and questions of taste and design. Erections not buildings, such as glass covers to yards, private bridges between buildings in one occupation, telephone and telegraph posts on buildings, wall-signs, fowl-houses, and similar structures should be subject to the control of district surveyors. We think that rights of light and air should be included in the new Act, as though they are in the nature of private property, they are as much matters of sanitation as ventilation or plumbing, and, therefore, of public interest. In the clauses of the proposed draft Bill the definitions have been amplified, and in some cases improved. Thus, under the term "public building," the old Act defines it to mean every building used as a church, chapel, or other place of public worship; also every building used for purposes of public instruction; also every building used as a college, public hall, hospital, theatre, concert-room, public ball-room, public lecture-room, exhibition-room, or for any other public purpose—a definition cumbrous in enumerating examples. The proposed draft clause is more scientific and comprehensive, for under "building" "every erection is included, comprising a cubical space defined by walls, piers, posts, or other structures, and a roof or other covering, whether such erection is wholly inclosed or not, and whether it is fixed on permanent foundations or not, and of whatever materials it is constructed, and for whatever purpose it is used, &c.," a definition which includes every conceivable form of erection. The term "public building" is amplified, and is made more comprehensive. Other definitions are given, as "wall-sign," which includes "any word, letter, model, sign, device, or representation in the nature of an advertisement or announcement fixed to or against any wall, shop-front, or other vertical inclosure, and includes "every part of any framework, bracket, or other support," so that the present "sky sign" definition in the Act 1891 is left as it is, the "wall sign" being intended to apply to advertisements hung or supported from walls or fronts. A warehouse is defined; "domestic building" is defined under three classes, A, B, and C. There is a need for including certain buildings that are neither warehouses nor public buildings, such as business offices or shops; the class B division of outbuildings or stables appears also to be required to bring every kind of erection within the Act. The definitions of "habitable" room and "living room" will make it difficult for anyone to evade the Act. "Underground room" is also defined as "any habitable or living room in a domestic building, the surface of the floor of which is more than 3ft. below the surface of the footway or of the adjoining street, or the ground adjoining or nearest to the room." This is an important definition which would render the section referring to underground rooms more operative. Definitions are added of "story" and "topmost story," which are not found in the present Act. The term "site" is defined as the actual ground covered by the building, and any ground appertaining thereto, or belonging to the owner within a line at a uniform distance of 3ft. from the outer edge of the footings; whereas the present meaning refers to the space occupied between the bottom of foundations and the level of base of walls.

The draft definition of "cubic contents" appears inadequate: it takes the superficial measurement within the inside of external walls, instead of including the walls,—surely this is not intended. The height is measured from lowest floor to underside of rafters or joists; it would be more correct to take the height to half-way the distance from springing to apex of rafters. Other terms, such as "fire-resisting," are added, to which we cannot refer now. An important alteration is made as regards the clauses of 1878, referring to roadway, and centre of roadway,—instead of roadway, the word "street" is substituted. In buildings exempted from the operation of the Act, one important addition is made (clause 6) after the present clause, to this effect: "No building shall be exempt where it is erected on any estate laid out for building, on which it is intended to erect other buildings, or to let, or sell, any ground other than to the owner of such building within the said distance of 30ft.," &c. This amendment will serve to check overcrowding on estates. Referring to greenhouses, which are exempted as regards the necessary woodwork of sashes, doors, and frames, the draft suggestions append the following qualification: "but if any greenhouse be attached to any other building, the exemption shall only apply to those greenhouses which do not exceed in area 300ft., and do not exceed in height at any point 20ft. measured from the floor." Two very important clauses are introduced, one referring to alterations or conversion of buildings, and the other to the restoration of buildings of architectural, archæological, or historical interest. The first provides that any building exempt from the operation of the Act shall remain so only so long as it is used for the purpose, or retains the character, or is converted to a use by reason whereof it would be so exempt; but on its ceasing to be so exempt, or on its conversion to a use or purpose other than previously, it is to become subject to the provisions of the Act applicable to its new use or purpose. The next clause provides for the restoration or reinstatement of old buildings taken down or destroyed with or without the consent of the Council.

The section on By-laws of 1878 on Foundations and Sites of Buildings is slightly altered by leaving open the manner by and material with which any holes caused by excavation are to be filled up, these being determined as the Council shall by by-law make from time to time. The provision for a layer of concrete 6in. thick is altered. The "floor area over the earth under every building" is substituted for the word "site," and the thickness of concrete is left to the Council to determine by by-law. The Council is also to decide on thickness of the bed of concrete or other material of the foundations, given in a schedule, according to the height of walls. We cannot here enter into other structural clauses of the draft Bill relating to the old sections 12—13 referring to the structure of walls, recesses, and openings. Many emendations are made, other sections are omitted. Some important additions and alterations are made to the sections of the old Act relating to separation of buildings and limitation of their areas (sect. 27); the limiting height of buildings other than churches or chapels is fixed at 75ft., exclusive of two stories not exceeding 20ft. on the roof, and of ornamental towers, turrets, or other architectural features, which is more reasonable than the 90ft. provided in the Act of 1890. The latter portion of the section is, however, retained, which limits any increase of height to 90ft. (exclusive of above) without consent of Council.

LONDON BUILDING (CONSOLIDATION) BILL AMENDMENT.

SEVERAL important amendments have been suggested by the Building Act Committee of the London County Council. After section 4 of the Consolidation Bill, regulations to insure an adequate strength of joists are introduced with minimum scantlings; in section 7, provisions to secure access to roof, in case of fire, either by a dormer window or door opening on to roof, a trap-door and fixed ladder, or other means. It is proposed to increase the minimum height of habitable rooms from 7ft. to 8ft., and to make a window opening directly into the open air, a condition (sect. 12 of Consolidation Bill). Under sect. 15, a clause is proposed to regulate oriel windows in streets 40ft. wide. Section 18 is most important, and has been framed after several conferences with the architect and medical officer. The committee do not agree with the Local Government Board by-law, adopted by Manchester, exacting open space at the rear of small houses of 25ft. in depth; but adopt so much of it as will secure a space of 20ft. between buildings at the rear, or 10ft. for each building, as in force in Liverpool. The rest of the ground may be covered by buildings, "provided that no part of them (except chimneys, &c.) pass above a line drawn from the rear boundary of the plot towards the house at an angle of 45° with the horizon." This rule does not unduly interfere with owner's rights, and it gives each house an open space in proportion to its height. These provisions are not intended to extend to the city. Under section 19, it is proposed to limit the height of buildings to 75ft. with two stories on the roof, the same as suggested by the R.I.B.A. It is also proposed to regulate the width and construction of staircases, passages, and doorways of all churches and chapels. Several important definitions have been added, and others much improved and simplified. Other amendments simplify the law relating to party-walls.

◆

BRITISH ART WORKERS AND MANUFACTURERS.

WE give this week another sheet of portraits of art workers and manufacturers who have distinguished themselves successfully in connection with the crafts and trades connected with architecture:—

Mr. M. J. Adams was born at Eastbourne, and educated privately. He served an apprenticeship with Messrs. Ransomes, Sims, and Head, of Ipswich, the well-known engineers. On leaving the works, he studied civil engineering and architecture in different capacities, and subsequently commenced private practice, later becoming a partner in the firm of Adams and Co. He is the author of various patents in general engineering and sanitary work.

Mr. S. H. Adams was born at Eastbourne, and privately educated. He served articles in the engineering works of Messrs. Hunt and Tawell, and later spent many years with a well-known civil engineer in the North of England, where he had extensive practice in drainage and waterworks, mine and land surveying, railway work, &c., subsequently joining the firm of Adams and Co. He has introduced many valuable patents, well known in the special work with which he is connected.

Mr. Sidney Goodman, of the firm of Goodman, Hughes and Co., Bishopsgate-street, London, was born in London, and is the son of Mr. Josiah Goodman, a very prominent and widely-known Nonconformist, who, with his brother, had carried on an extensive business as builders, and who had, in connection therewith, joinery mills at Bow, and a lime and cement wharf on the Regent's Canal. He was educated at Bishop's Stortford and in Germany, under the personal supervision of Herr Mess, at Neuwied, on the Rhine. In 1879 he entered the service of Messrs. Prier, Wotton, and Co., with the idea of finally starting on his own account. Subsequently, however, his father having purchased his uncle's share in the Regent's Canal business, presented him with the entire concern, which he, with ample working capital, carried on so successfully, that, while still running the business, he entered into the present partnership with Mr. Hughes in March, 1889, which has since proved so satisfactory. Messrs. Goodman and Hughes, in spite of the fact that the firm has only been constituted for the short space of three years, already take a place in the front rank of City timber merchants. They have lately opened a timber auction mart, which has been remarkably successful, and is likely to be still more so.

Mr. Joseph Constantine, the senior partner of the firm of J. Constantine and Son, warming and ventilating engineers, Manchester, is well known as the author of "Hydropathy at Home," "Health and Activity in Middle and Later Life," also "Practical Ventilation and Warming"; he is a practical hygienist, and has had an experience in those matters within a few months of fifty years. He was born on the 10th of June, 1823, in the Worth Valley, near Haworth, now famous as the Home of the Brontës. In 1842 he began to pay attention to the water cure, in 1848 he was engaged at a bathing establishment, and in 1850 he opened baths of his own in Manchester. In 1857 the Turkish bath was introduced into this country; the first attempts at heating it were on the Oriental plan—primitive, unscientific, and wasteful of fuel; ventilation was not considered at all, smoke flues traversed under the floor, or in the walls of the hot rooms; there was no constant supply, or change of air, to carry away the effluvia thrown off by the patients when perspiring; this was a sanitary defect, serious if not of a dangerous nature, which called for immediate remedy. Mr. Constantine first heated his Turkish baths by a tier of pipes fixed in a chamber. This system has been passed off twice of late years as a new invention. From these pipes a large volume of warm air was produced, but they soon burned out, and had to be frequently renewed. He then tried various stoves, and found that they all cracked, there being no provision for expansion and contraction, and after many experiments and failures, in conjunction with the late Thomas Whitaker, the convoluted stove was completed, in which not only expansion and contraction was provided for, but an immense addition of heating and radiating surface was gained, which accounts for the great saving of fuel where it is in use. With this invention the problem of heating economically and the thorough ventilation of the Turkish bath was solved, and it became at once a reliable and definite science. The necessary size and power of heating apparatus for the cubical area to be heated, the size of flues for fresh air, and size of inlet flues for warm air, and outlet for vitiated air is now a mere matter of calculation with the firm of J. Constantine and Son.

Mr. James Stiff is the senior partner in the old-established firm of James Stiff and Sons, who carry on the manufacture of sanitary and general stoneware and plumbago crucibles, &c., at the London Pottery, Lambeth. More than sixty years since Mr. Stiff left his native village of Rougham, Suffolk, with the hope that in London he might find some better prospect of rising from the labouring to the artisan class. After much difficulty and discouragement, his perseverance, industry, and thrift, enabled him about fifty years ago to seize an opportunity which then offered of renting a small pottery with one kiln, in High-street, Lambeth. The pottery had been established nearly a century earlier, by a Dutchman, for the manufacture of wall tiles, and included a portion of Hereford House, the ancient palace of the Bishops of Hereford. Mr. Stiff's enterprise and success resulted in a rapid extension of the pottery, until it comprised the present large freehold premises bounded by High-street, Broad-street, and the Albert Embankment. Mr. Stiff s earliest manufactures consisted chiefly of bottles, jars, jugs, and other similar pottery ware; but the introduction of stoneware drain-pipes, of which he was one of the earliest makers, gave a great impetus to the business, and until the year 1870 these goods formed the staple productions of the pottery. At this period Mr. Stiff decided to hand over most of the practical management to his sons, in order to devote his time more largely to public work. He was elected on the first School Board for London in 1870, and continued a member of the Board for twelve years, and for about half that period he held the position of Chairman of the Works Committee. Mr. Stiff has also been an earnest worker in the cause of philanthropy and religion. It may be mentioned, among other benefactions, that he has built, chiefly at his own cost, a large Baptist chapel at Stockwell, and has founded and endowed almshouses for the aged poor in his native village of Rougham. In 1889 Mr. Stiff was elected Master of the Worshipful Company of Loriners, and is so represented in the accompanying portrait. During the last 20 years the firm has extended its range of manufactures to include architectural terracotta, for which it obtained the only gold medal awarded for this material at the Calcutta Exhibition. Much of this firm's work has been sent to India, no less than six large Government buildings in Calcutta being adorned with terracotta manufactured at the "London Pottery." Several palaces of native princes have also been supplied with this effective ornament. A great variety of sinks, latrines, sewer-air, and grease-traps, and other sanitary appliances have also been added to this firm's manufactures, and the growth of electrical science, and especially of electric lighting, has brought demands for insulators, battery-jars, porous-cells, and other pottery appliances.

Mr. William White, of Abergavenny and Newport, Mon., commenced business early in life as a builder and contractor, and made ecclesiastical work and church restoration the leading feature of his work. Nearly all the churches restored by the late Mr. John Pritchard, diocesan architect, of Llandaff, were placed in Mr. White's hands, and also a good deal of work by Mr. Ewan Christian for the Ecclesiatical Commissioners. Mr. White had naturally in many cases to contend with damp walls, and the methods then followed of rendering walls damp-proof appeared to him most unsatisfactory. After a great many experiments and much thought, he invented and patented what is now known as the hygeian rock method of building walls, and this method being successful, he subsequently devoted the greater part of his time to its development. Mr. White has also invented and patented a new method of laying pavements and roadways (of which we gave a notice some short time ago), and which, after exhaustive experiments, is believed to have all the advantages of McAdam's and asphalte, without the disadvantages of either. A company, called the Patent Composite Block Road and Paving Co., of which Mr. White is the managing director, has been founded, and he is now engaged in building new works and laying down machinery on the banks of the Usk at Newport, Mon.

◆

THE PRESCOTT-HEWETT WATER-COLOUR DRAWINGS.

THOSE who value our native school of painters will be much interested in the fine collection of water-colour drawings on view at South Kensington Museum, the Prescott-Hewett gift to the National Gallery of British Art at that institution. The drawings are arranged on screens, but are irregularly numbered, a defect which we hope will be rectified. Sir Prescott-Hewett's collection is chiefly representative of the traditions of the Old Water-Colour Society, the names of Sir John Gilbert, R.A., the veteran painter of historic and dramatic scenes, G. H. Andrews, Thomas Danby, George A. Fripp, Francis Oliver Finch, H. G. Hine, Prout, Albert Goodwin, Carl Haag, and C. Green being among the artists. Mr. G. H. Andrews' "Amphitheatre, Arles" (1) is an example of the old school in its treatment and poetic delineation of classic ground; the drawing is decisive and the colour strong. William Bennett, who died in 1871, was a clever painter in water-colours of the last generation. His boldly-painted torrent of mountain water and bridge near Capel Curig, North Wales, or "Bridge and Waterfall" (3), is executed with much depth of tone; the rushing torrent is full of movement, and the masses of rocks and foliage in the foreground handled with considerable power. One of the most characteristic painters of the older school, Thomas Danby, is represented by two landscapes of excellent quality. "Snowdon" (4) is remarkably fine in its sunlit atmosphere and soft stippled effect produced by abrasion of colour in the mountain distance—a fine evening effect; while the companion picture, "Welsh Mountains—Morning," is a dexterous piece of handling in the foliage and foreground and hilly distance, and the colour and sunlight effect is warm. Another classical painter is George H. Dodgson, who died in 1880. Three subjects, two of Knole Park (9 and 10), dated 1863 and 1876 respectively, are shown depicting, in his own inimitable and poetic manner, beech glades. The foliage, under the varied effects of sunlight and shadow, is rendered with masterly skill, and the variety of yellows and bluish-greens charming. In another the majestic trunk of a beech is seen against a mass of dark foliage. The colour and foreground drawing are very fine. "On the Coast of Yorkshire" (11), one of those wild and grand pieces of rock seen on the coast, like Flamborough Head, is an example of this painter's power—a dark mass of rocky headland, with waves breaking into foam and spray. One of the earlier painters of the present century, who died in 1862, is Francis Oliver Finch. His "Moonlight" (16) takes us back to the time of the old classic landscapes, with its rounded foliage, broken temples, lakes, and river scenery, such as Lorraine gave us. This drawing represents the earlier Italian style of landscape, of which Wilson was an exponent, in which the colours were mainly blues and browns put on broadly and thinly. The exceptional strength and romantic beauty of Sir John Gilbert in his best days is seen in his fine picture the "Arrival of Cardinal Wolsey at Leicester Abbey" (23) a subject well adapted to the genius and dramatic skill of the president of the old society. The Cardinal in his scarlet robes is surrounded by a host of personages. Torches light up the scene. The bishop holding his crosier, and the women kneeling at the cardinal's side, make up a crowded scene, full of pathos and dramatic action. The light and shade and colour contribute to the effect of this fine composition. The works by George A. Fripp (19-22) are equally characteristic of the period. The "Old Windmill near Eastbourne," painted in 1868, is an admirable specimen of this artist's work, a clear, bright sunlight suffusing an open landscape; standing majestically in its solitude is a windmill. The decision and crisp handling which we see in Mr. Fripp's modern work are conspicuous in "Children of the Mist"—a moorland scene bathed in mist, a torrent rushing through a rocky bed, with swift-footed deer gambolling in the distance —delightful in tone and colour; and some delicate handling is shown in "Dunstaffnage Castle, Argyleshire" (22). Another living artist, Albert Goodwin, has a delicately-finished drawing of "Allington Castle, Kent," hardly equal to his genius, though we can see enough in his minute manipulation of foliage and depth of tone to admire. Mr. H. G. Hine also is not represented by his best work, which to those who know his capabilities appears to be the open landscape and downs of Sussex. Those here seen are two coast views, one a "Reef of Rocks at Peveril Point, Dorset" (31)—a fine rendering of rock stratification and sea, painted in 1865—and "Entrance to the Kyles of Bute" (32). They are at least interesting examples of conscientious study. In the same class of subject is the late John Mogford's "Coast of Cornwall" (37), painted also in 1865—a very beautiful study of stratified rock and laving sea, which is scarcely to be surpassed by the more vigorous and broader style of painting now in vogue. An example of Henry Moore (38) is numbered next. As a seascape we have little to surpass the exquisitely finished study of "A Grey Day at Sea" (41), by F. Powell, a fine rendering of sea waves and lighted crests and troughs, as admirable in colour as it is in drawing. "The Winkle Gatherer" (46), by J. D. Watson, is strong in colour, the rocks and pools drawn with masterly effect. Other powerful landscapes are J. W. Whittaker's "Road between Capel Curig and Lake Agmen," dated 1863—a wild hilly scene painted with masterly breadth and strength of colour, and Cuthbert Rigby's "On the Moors," a clever piece of handling. A charming drawing of a tomb, G. J. Skinner Prout, "The Knight in Dust," on a canopied tomb (43), is worth attention for its nice colour and tone.

One of the finest figure studies is Josef Israel's "Worn Out," a cottage interior, representing an old man in a sort of cupboard bed, a dog on a chair by his side, and his hard-working wife seated mending a garment. The whole is powerfully and pathetically painted, the depth of tone, chiaroscuro of the darkened casement-lit chamber adding to the impressive and emotional aspect of the scene. We see in the barely discerned lineaments of pain and hardship in the solitary inmates the painter's love and appreciation of the mystery of life, its woes, and realities. Sir J. D. Linton is represented by a Cavalier-looking student, a finely executed and scholarly work (35); also "The Reliquary," equal in its drawing and refined colour. One of the finest figure studies is H. B. Roberts's "The Sermon" (45), an elderly man, his head resting on his arm, pathetic in motion, and admirable in the chiaroscuro. Carl Haag's brilliant figure subjects, "In the Desert" and "In the Sugar Plantations" (28 and 29), are masterly. We must also notice James Holland's "Canal in Venice" (33), which is full of nice harmony; C. Green's "Rabbit Hutch" (27); W. W. Deane's "Street in Venice" (6).

"SWEATING" THE PROFESSION AT BRIGHTON.

A SPIRITED discussion arose at the last meeting of the Brighton Board of Guardians in reference to the appointment of an architect to prepare plans for the new parochial offices to be erected in Prince's-street. The sub-committee, having considered applications, or rather tenders, from twelve architects, recommended that Messrs. Nunn and Hunt, of 129, Queen's-road, Brighton, be appointed as architects on the following terms—namely, "If the cost of the building does not exceed £5,000, their fee to be 2¼ per cent. on the ultimate cost; if the cost of the building exceeds £5,000, their fee to be 2 per cent. on the ultimate cost. The foregoing terms are inclusive of the preparation of all necessary sketch-plans."

The vicar (Prebendary Hannah) vigorously opposed the adoption of the report, remarking that he did not call this economy. It was cheese-paring; in fact, "sweating" with a vengeance. He had had a good deal to do with the employment of architects, and he had never known one accept less than the recognised professional remuneration of 5 per cent., and, so far as his experience went, that charge was only a fair one. To him it seemed undignified for the board of guardians to go behind the professional custom and to seek to get the work done in the cheapest manner. He had not one word to say against the gentlemen selected; but he did not think it right that a board like the board of guardians should "sweat" the professional classes by hawking about such a job as this to see how cheaply they could get it done. He moved as an amendment to refer the report back to the committee for further consideration. The amendment was seconded by Mr. Councillor Loader, an architect, who stated that, in the advertisement inviting tenders, not one word was said as to what amount it was contemplated to spend—whether two, five, or ten thousand pounds, and he also argued that the proper course would have been to invite competitive designs. The Chairman denied that the matter had been "hawked about." The tenders were invited by public advertisement; but, for reasons he could not explain, it was not deemed desirable to mention any amount. If architects chose to go below the recognised 5 per cent., there was no reason on earth why the board should not accept their offer; and he might mention that they had others nearly as low as the one they proposed (and as he thought wisely) to accept. The clerk to the board explained that the board were not in a position to advertise for competitive plans. When the architect and Inspector of the Local Government Board came down to see the site that had been selected, they told the committee that it would be useless to send up any plans to the Local Government Board for approval until a deputation of the board had been to London, with the architect who would have the preparing of the plans, to see some parochial offices that had recently been erected there. It, therefore, first became necessary to secure an architect that would undertake the preparation of the plans, and an advertisement was issued inviting tenders for the performance of that work on commission. Mr. Councillor Booth said the vicar had come there to bolster up trades-unionism amongst architects; but he appealed to the members to support the committee. After further discussion the report was adopted, only four members, including the vicar and Mr. Arthur Loader, voting against it.

ARCHÆOLOGICAL.

THE FOUNDATIONS OF KING'S CROSS.—In constructing the subway between the Great Northern Railway terminus and the King's Cross station of the Metropolitan Railway, the engineers, Mr. E. P. Seaton, C.E., and Mr. A. N. Hawtrey, A.M.I.C.E., have had numberless obstructions and difficulties to overcome; in the first instance to find sufficient room beneath the roadway and the crown of the tunnel of the Underground Railway to construct the subway, 8ft. deep and 8ft. wide. Next came the Fleet Sewer, which has had to have its crown reduced some 6in. In addition to this, the gas and water mains running parallel with the sewer have had to be diverted and encased in subways. After completing this part of the work, Messrs. Fairbank's men came across a solid block of concrete several yards square, 2ft. under the centre of the roadway, a few feet north of the Metropolitan tunnel. According to old plans, it is the foundation of the cross erected in 1290, by order of Edward I., as one of the resting places of the body of Queen Eleanor on its way from Hornby, in Lincoln, where she died, to Westminster Abbey. Owing to the close proximity of the traffic above, it has been found impracticable to blast the block by powder or dynamite. Consequently, the men have to work upon it with steel wedges and sledge hammers, very little impression, however, being made day by day, as the wedges quickly turn up. It is expected the work will be completed by April.

* * *

As a memorial to the late Lady Bruce, the three lancet windows at the west end of Christ Church, Castlerock, have been filled with stained glass. The subjects selected are "The Six Acts of Mercy," and the artists were Messrs. Wailes and Strong, of Newcastle-on-Tyne. A peal of bells has also been hung in the tower of the church. The dedication took place last week.

The forthcoming exhibition of Old Masters at Burlington House, which opens to the public on Monday next, will contain an important selection of Dutch and English pictures lent by Lady Wallace from Hertford House, the bulk of the Italian collection belonging to the Earl of Dudley, and a number of works by Rubens and other masters from the collection of Mr. Banks, of Kingston Lacey.

Building Intelligence.

IPSWICH.—The parish church of St. Clement was re-opened on Tuesday week, after being partially restored from plans by, and under the supervision of, Mr. E. F. Bisshopp, of Ipswich. The arcades and piers have been cleansed from coatings of whitewash and paint, and the patchings with plaster replaced by stonework. The whole of the floors beneath the pews, which were infested with dry rot, have been removed, the vaults beneath filled up, and wood-block flooring, with oak centres, substituted for deal boards. Oak benches of 15th century detail, and poppy-head ends, take the place of the former pews, and new prayer-desks, also of ash, have been introduced into the chancel, which is now paved with Godwin's encaustic tiles. The work has been carried out by Messrs. Hawkins and Pettit, of Monks Eleigh and Ipswich, contractors. The expenditure has been about £800.

SALISBURY.—New baths have just been completed for the Salisbury Swimming Baths Co. The building is about 94ft. long by 50ft. wide, with slipper-baths adjoining. The roof consists of iron principals with lantern ventilators, and is covered partly with slates and partly with glass. The bath itself is 80ft. long by 34ft. wide, lined with glazed bricks, and the water is procured from a well sunk on the premises and warmed by steam injection to a temperature of 75° Fahr. A gallery runs along the two sides and one end of the building, under which the dressing-boxes are arranged, accommodation being made for 41 bathers. These dressing-boxes, as also the building, are warmed by steam-pipes. In connection with the swimming-baths, and fronting on Church-street, a steam laundry has been erected, fitted with every modern improvement, and capable of turning out £60 of work weekly. The hot water for baths and laundry is supplied by a 20ft. Cornish boiler. The total cost of the laundry and baths, exclusive of the site, was about £4,500. The roofs are glazed by Messrs. Rendle and Co., of 5, Victoria-street, Westminster, on their patent "Acme" system. The contractor for the building was Mr. John Wort, of Park-street, Salisbury, and the building was designed and carried out by Mr. Alfred C. Bothams, A.M.I.C.E., architect, of 51, Silver-street, Salisbury.

WOLVERHAMPTON.—The new buildings at the Borough Hospital for Infectious Diseases, Wolverhampton, were formally opened last week. The additions to the hospital comprise an entrance-lodge, enlargement of the administrative block, and a hospital pavilion. The pavilion is designed to accommodate eighteen beds, and has two main wards (male and female), each 50ft. by 26ft. Each ward is arranged for eight beds, every bed having a wall space of 12ft., 162sq.ft. of floor space, and 2,268c.ft. of air space. Between these two wards is the nurses' duty-room. In the centre of the front wall to each ward casement windows are arranged which open into a verandah. Mr. H. Lovatt was the builder, whose contract for the work was £3,604. The buildings were erected from designs prepared by the borough surveyor, Mr. Berrington.

CHIPS.

Holy Trinity Church Schools, Idle, are about to be enlarged, from designs by Messrs. J. Kendall and J. H. Bakes, M.S.A., architects, Leeds and Idle.

On Sunday, the 20th ult., a stained-glass window was unveiled at Idle Parish Church, as a memorial to the late vicar, the Rev. Henry Harrison. The subject is "The Good Samaritan," and the work has been carried out from designs by Messrs. Kayll and Co., 70, Albion-street, Leeds, under the supervision of Messrs. J. Kendall and J. H. Bakes, M.S.A., architects, Leeds and Idle.

Mr. William Henry Punchard, railway contractor, of Bourton Hall, Totnes, died on Sunday. Mr. Punchard had been suffering from influenza, but his death was somewhat unexpected. He had constructed a large number of railways abroad, and had also been engaged in extensive marine enterprises.

New co-operative stores at Winnington, Cheshire, were opened last week, the buildings including a public hall at the rear, seated for 700 persons, a library and reading-room, besides shops and warehouses. Mr. Hawksley, of Manchester, was the architect, and Mr. Molyneux the contractor.

WAYSIDE NOTES.

A HAPPY NEW YEAR! I am relieved to find myself in the land of the living so that I may present this seasonable compliment. About this time of the year a miserable feeling comes over me that I may be buried alive in the annual shoal of diaries, almanacs, &c., of the enterprising manufacturer. Wonder of wonders!—I have received none! It is true the next few days may put a different aspect on affairs, and it may be necessary to "dig, basket, and wheel" to the approaches to our office door in order to clear away the *débris*—otherwise, the accumulation of calendars, &c., deposited by a relentless Post Office. Yet am I hoping that the yearly protests in my own particular corner of the "B. N." may have proved of some avail, and that manufacturers will at last awaken to the fact that an architect in his right senses does not plaster his office walls with a hundred-and-one calendars, nor does he require to enter his doings for the day into fifty separate journals.

We draw the line at almanacs, although there is no denying that some members of our august profession do put strange things upon their office walls. Some business or another once took me into a gentleman's drawing-office, at the end whereof I noted a large frame crammed full of —photos. of cathedrals? By no means. The frame contained a score or more of *contemporary actresses and professional beauties!* The idea, doubtless, was that "the flowing line" was suggestive of new and elegant mouldings, though to me the impression was that I had better make good my escape from so strangely ordered a place whilst my skin remained intact. Well, taste in these matters of office-decoration is a funny thing, unaccountable and perverse as many, if not most, matters of taste. Our old friend Mr. Pecksniff, it will be remembered, had his own highly professional style of adorning the walls with various and diverse portraitures of Salisbury Cathedral. As a rule, I fancy that architects "offer up" perspectives—"highly-coloured," for preference—of their great jobs, and fill up odd corners with their smaller ones, so that when the new client comes in he may be duly impressed. This is a great thing.

I see that the Institute contemplates adding to the pictures on the walls at Conduit-street by placing thereupon a portrait of Mr. Waterhouse. It was no surprise to learn that the movement had been well supported, and that a large number of members had given their support. No one has proved himself more worthy of the honour than Mr. Waterhouse, and it only remains to hope that the portrait will be a good one.

Readers having in their mind the proposals made to establish a National Gallery of British Art, will have wondered whether anything practical would come from the talk on the subject, and may be interested to hear that, in a letter to Tuesday's *Standard*, Mr. Frederick Wedmore deals with the question "up to date." It seems to have been for some time a common understanding that the Government has declined to purchase, for a hundred and fifty thousand pounds, an Embankment site at Blackfriars that the City Corporation offered for the purpose. This is scarcely surprising; the outlay would be tremendous for such a purpose, and a cheaper site should be sought. Mr. Wedmore expresses a hope that the abandonment of the scheme as regards this site may not cause the Government to lose interest in the proposed Gallery, and advocates the adoption of an alternative site at the east and west galleries by the Horticultural Gardens. It appears that a sub-committee appointed to inquire into the suitableness of this site has given a wholly favourable judgment, and that the galleries could be prepared at a small cost, and immediately. This scheme is to be recommended for its economy; but the dressing-up of old galleries seems scarcely to fill the imagination—so to speak—prepared by the past talk on the subject; and something midway between the very costly Embankment site and this very modest Kensington one would seem to me to meet the case. An increasingly difficult matter, however, is that of finding sites in London —a difficulty that may well be said to increase as the square of the size of the building—and if there is to be endless trouble in the finding of a site for the proposed gallery, better at once adopt the proposal relating to the old Kensington buildings.

I suppose there has been, or will be, another controversial outbreak respecting fires at theatres and theatre-staircase construction, *in re* the last Gateshead disaster—the *last*, advisedly, because all will remember the comparatively recent accident with the rickety condensers, and the deplorable loss of life that followed. The unfortunate point about these accidents—so far as concerns future lessons—is that there is always something new or novel in the disaster that seems to put it out of the category of things that might have been prevented by attention to past experiences. Like all—or most—railway accidents, where a certain part of the train generally "comes off" worst, the theatre fire generally brings most direful consequences to the gallery. Improvement in gallery exits and staircases should be the endeavour; but herein lies the difficulty, for to take more space for the gallery means cutting short the exits and staircases from other parts of the house. It is evident, too, that taking a third-class ticket for the railway, and a gallery ticket for the theatre must of necessity entail an increased risk in case of accidents. A life is a life, however, whether in a first-class carriage or a third, and whether in the stalls or the gallery of a theatre, and this should be realised by planners and managers of all places of amusement where, from the intricate nature of the seating arrangements and means of access and egress, there must always be an element of risk in cases of fire, or panic from an alarm of fire.

Our "Constant Reader" sends me further cuttings from the *Sussex Daily News* respecting the appointment of an architect to the new parochial offices that the Brighton Board of Guardians propose to erect. A report of the meeting of the board shows how, in the Rev. Prebendary J. J. Hannah, the Vicar of Brighton, architects have a true friend and champion. The vicar protested against the attempt to cut down the recognised remuneration of architects, which he well designated as sweating and cheese-paring. The report of the Parochial Offices' Site Committee will give readers an idea of how this matter has progressed:—"Your Committee report that they have received applications from twelve architects, residing or practising in Brighton, willing to prepare plans, specifications, and estimates for the erection of the proposed new parochial offices in Prince's-street, and having carefully considered the same, they recommend that Messrs. Nunn and Hunt, of 129, Queen's-road, Brighton, be appointed as architects on the following terms, viz.: If the cost of the building does not exceed £5,000, their fee to be 2¼ per cent. on the ultimate cost; if the cost of the building exceeds £5,000, their fee to be 2 per cent. on the ultimate cost. The foregoing terms are inclusive of the preparation of all necessary sketch plans." The recommendation of the committee was finally accepted.

At first I took it that the 2 or 2¼ per cent. of the successful tenderers was simply for the preparation of plans, &c., and that superintendence was not included; but from the remarks of Mr. Councillor Booth I gather that it is in place of the usual 5 per cent.—in which case there is "sweating" indeed; and the Vicar of Brighton has every reasonable argument on his side. If it just pays an architect to plan and look after a building for the same percentage on its value that an auctioneer takes for a few hours' work, how can the former individual be expected to devote the same thought and attention for one half, or less, of this remuneration? The Brighton guardians—with the exception of an architect, the Vicar, and two others—like most of their class, cannot see farther than their noses. Very immediate and very evident saving of outlay is the only economy they can appreciate. I suppose one should be a little incensed with the gentlemen "tendering"; but somehow, in this case, I only feel that the guardians are to blame. They, first of all, carefully excluded outside architects—and therefore outside criticism—and set the Brighton men against one another. As a natural result of this piece of business, a paragraph in the *Sussex Daily News* speaks of "the firm tendering for the work at the lowest commission." I am glad to see that the Vicar of Brighton has given notice of a motion at the next meeting of the board; and our best thanks should certainly be given to both him and "Constant Reader" for directing attention to and kindly defending interests vitally affecting the future of the architectural profession, in the regrettable absence of any competent corporation or governing body capable of making and enforcing reasonable rules of professional etiquette.

GOTH.

COMPETITIONS.

CANNOCK.—The Cannock School Board have selected the designs of Mr. Geo. H. Cox, architect, of Birmingham, for the proposed schools at Chadsmoor.

KEIGHLEY.—The designs for new School Board offices, Keighley, submitted in limited competition by Mr. Ledingham, architect, Bradford, have been selected.

NORTHAMPTON.—At the last meeting of the Northampton School Board the report of Professor T. Roger Smith, F.R.I.B.A., on the designs submitted for the new schools in Stimpson-avenue was considered and adopted. Eleven designs were sent in, and the first position was obtained by "Supervision," sent in by Mr. C. Dorman, architect, of Abington-street, Northampton; and the second by "Avondale," prepared by Mr. M. H. Holding, A.R.I.B.A., of the Corn Exchange, Northampton. The estimated cost of the former is £8,800, and of the latter £8,250. Professor Smith, in his report as assessor, remarks, of the design placed first, that the three departments "extend back eastwards roughly like the wards of a hospital on the pavilion plan—a disposition which offers considerable opportunities for good ventilation. The planning is so arranged that all the classrooms are under the personal view of the head teacher. Left-handed lighting is provided in many of the classrooms, and in every classroom but one and in the schoolroom cross-ventilation by good-sized windows is secured. The architectural treatment is satisfactory, and the general arrangement is very practical." "Avondale," the second design, is, he reports, planned on the central-hall system, as were three other designs. The buildings are kept distinct. Each of the three schools has its own central hall and its classrooms in connection therewith, the area of the halls not being reckoned as part of the floor area for teaching purposes. The central-hall system, though no novelty, is, comparatively speaking, of recent adoption, and is well adapted to very large town schools, but it entails difficulties which have to be considered—expense being the chief. There is also, especially in schools where open fires or gas is employed, difficulty in warming the hall, and to some extent an administrative difficulty.

OXFORD.—The following are the names of the five selected competitors for the Municipal Buildings at Oxford, chosen by the referee, Mr. T. E. Collcutt, out of the 132 architects who submitted designs in the first contest. The choice has only this week been confirmed, or we should have printed the names a fortnight ago. They are: Messrs. Charles Bell, A.R.I.B.A., London; E. Runtz, London; J. B. Hikins, Liverpool; J. T. Hare, A.R.I.B.A., London; and Messrs. Perkin and Cheston, London. We need hardly say that the adjudication was made before the names were known to anyone concerned in the competition, and we believe that the list has not been published elsewhere.

A bacon-curing factory has been built at Redruth at a cost of £8,000, and was inaugurated last week. The plans were drawn by Mr. O. Caldwell, of Penzance, and the building contract let to Messrs. J. Julian and Sons, of Truro, whilst that for machinery was given to Messrs. Pontifex and Wood, of London.

After having undergone alterations, the bank premises on the street level of the Town Hall Buildings at Newcastle-on-Tyne have, this week, been taken possession of by the financial departments of the Newcastle Corporation. The requisite alterations were carried out under the superintendence of the city engineer, Mr. W. G. Laws.

A private Bill is being promoted, under which power is sought to construct a railway, beginning by a junction with the Epsom Downs branch of London, Brighton, and South Coast Railway, and terminating at Banstead, near Walton-on-the-Hill. The total length of the proposed railway is just under three miles, and the capital sought is £99,000.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations,* and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances,* under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance,* as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names up to Dec. 31. We have more in hand, which will appear next week, and any others that may reach us.

ARCHITECTURAL DESIGNERS—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

ARCHITECTURAL PHOTOGRAPHERS—
Bedford, Lemere, and Co., 147, Strand, London, W.C.

ARCHITECTURAL TERRACOTTA—

Our Illustrations.

"ST. AUGUSTINE PREACHING CHRISTIANITY IN ENGLAND": ROYAL ACADEMY PRIZE DESIGN FOR THE DECORATION OF A PUBLIC BUILDING.

Mr. Paul Raphael Montford's prize design, which we illustrate to-day, represents a scene supposed by the artist to have taken place after the election of St. Augustine to the Archbishopric of Canterbury; but the composition is really intended to illustrate the decay of heathenism as typified by the ruins of the Ancient Roman Temple in the picture, and the happy and glorious growth of Christianity as developed in England under the powerful influence of the Throne and the great administrative piety of this Catholic prelate. King Ethelbert and his Queen, Bertha, are seated to the left of the group, with the Archbishop, in the vestments of his office, preaching in the midst, while boys swing thuribles behind his Grace. In the background stands a crowd of monks and clergy, some bearing processional crosses and banners, and one carries the pastoral staff. The figure chosen by the artist for his enlarged cartoon is that of the deacon standing on the steps. The design must be considered rather for its composition than as an exact historical representation, elaborated with a precise care for ecclesiological detail. We shall illustrate the large cartoon figure at an early date. The present plate was reproduced from Mr. Montford's original prize water-colour drawing.

THE MAGISTRATES' ROOM AND THE JURY ROOM, THE VICTORIA LAW COURTS, BIRMINGHAM.

We publish to-day two photographs recently taken of these two handsome apartments in the new Law Courts at Birmingham. The refined and rich detail of this building renders it one of the most remarkable erections of the kind in England during the past few years, and any illustrations of its parts cannot fail to be interesting. Messrs. Aston Webb and Ingress Bell are the architects. We illustrated the competition designs in our issue for August 13th, 1886, and in July last, when the courts were opened, we printed some further illustrations, with a plan of the buildings as executed, and a description of the work.

ANIMALS FROM THE OUTER WALL, CARDIFF CASTLE, THE LATE WILLIAM BURGES, A.R.A., ARCHITECT.

Lord Bute's mansion at Cardiff continues to receive additions, and during the past year the beasts surmounting the outer wall over against the public street have been executed, in accordance with the original intention of the architect, the late William Burges, A.R.A. We were much struck by their force and boldness of design when we first saw them a few months ago. The double page of photographs which we print among our plates to-day illustrate five of these animals, each one of which is placed over a gabled pier of the wall. The lions with the heraldic shields stand on the entrance gateway piers, one on either side. Some of the beasts are painted in natural colours, and have glass eyes inserted. The bear and the lioness seem particularly clever and sturdy in design, sufficiently conventionalised without any loss of the characteristics of the beasts represented. The seal, too, rides well over the gable of the wall. For quaint humour, the apes have only to be named. The sculptor is Mr. Thomas Nicholls, of Kennington-road, S.E., who did the other carving in the castle, under Mr. Burges.

EXTERNAL PULPIT CHURCH OF NOTRE DAME, VITRE.

There are a few old external stone pulpits in England, such as those at Shrewsbury from the ruined abbey; Magdalen College, Oxford; and at the priory at Hereford. None seem to exist in Scotland, and only one is named in Ireland—viz., the pulpit in the cloister at Sligo cathedral. In France at St. Lô, on the N.E. side of the cathedral of Notre Dame, is a handsome external stone pulpit commanding the street; and at St. Dié, a small village not far from Blois, there is another old example in the cloisters of the cathedral. A plan and view of this figure in Viollet-le-Duc's "Dictionary," Vol. II. p. 413. Several others, no doubt, could be named, and we illustrate to-day one of the most notable from the church of Notre Dame at Vitré in Brittany, with its rich 15th-century canopy, built out solid from one of the main buttresses of the building. Like the one at St. Lô, it has a staircase within the thickness of the wall of the building communicating with the interior of the church. The carvings are spirited and grotesque, and the general proportions of the composition are admirable and effective. As an artistic arrangement of well balanced solid and void, the elevation of the whole thing, as shown in our drawing, leaves little to be desired. Vitré church itself is not one of special interest among those to be seen in this district of North-West France, and its details are chiefly Flamboyant in character. In one of the chapels is a frame containing 32 small Limoges enamels of some note. We published a drawing of an oriel window from the ruined castle at Vitré in the Building News for May 1st this year, with some account of the town.

IN THE GARDEN OF THE HOTEL METROPOLE, BRIGHTON.

The illustration we give is across the garden of the Hôtel Métropole, Brighton, a feature which adds greatly to the attractiveness of this now celebrated hotel. On the south side of the garden stands the ball-room, size 75ft. by 39ft., with a large recess for the band at the one end, and a crush room at the other. This latter room opens on to the upper garden, and communicates by an underground way and lifts with the kitchens of the hotel, which are situated at the top of this immense building. A broad and spacious corridor runs along the side of the ball-room away from the garden, connecting it with the ball reception-room, private dining-rooms, and other adjuncts. The turret contains a clock by Gillett and Co., of Croydon, with mosaic dials and musical chimes. As the ground rises considerably at the back of the hotel towards the north, advantage has been taken of this to make the garden of two levels. Broad flights of steps rise on either side to the upper garden. Below the arch supporting the steps is a fish-pond, which, like other points of interest in the garden, is illuminated in the evening with the electric light.

THE CHOIR AND CHANCEL SCREEN, FRANCISCAN CHURCH, INNSBRUCK.

The Hof-Kirche at Innsbruck is well known as the shrine of the celebrated sculptured marble tomb of Maximilian I., with its high grille of intricate metalwork, surrounded by the wonderful group of bronze statues representing kings and queens, and national heroes of historic fame, at once forming one of the most remarkable monuments in Europe, and of its kind it is certainly unique. The Emperor left directions in his will for the erection of the church and the sepulchre in which he was to be laid; he was, however, really never interred there, but lies at Wiener-Neustadt in Austria. Ferdinand I., his grandson, erected this church, and also the monument in the ten years following 1553. The lofty marble sarcophagus stands in the middle of the nave, and carries a bronze effigy of Maximilian, by Ludovico del Duca, in a kneeling posture, with his face towards the high altar. The colossal metal effigies of the "worthies" of Europe are eminently picturesque in design, skilfully executed in detail, and life-like in character. They are the work of Gregory Löffler and the Brothers Godl. The statues chiefly represent distinguished personages of the house of Austria; but among them is to be noted a figure of our own King Arthur. All the 28 figures are gorgeously dressed in full armour, or clad in costume of the richest description, but are not always in dignified postures nor in becoming attitudes. Our drawing to-day shows the screen and entrance to the chancel, with the statues right and left of the responds. Charles the Bold, Duke of Burgundy, and his father, Philip the Good, stand on the south side, and Joanna, wife of Philip I., mother of Charles V., is seen on the north of the archway. Beyond her is Ferdinand, the Catholic King of Aragon, her father. The church itself is comparatively poor in taste, erected in a long drawn-out and ill-proportioned rendering of a Composite order floridly treated, with angle set volutes to the caps of the columns, and covered with a flatly-contrived coved roof, shaped with groinings. The altar-piece in the chancel is very Rococo in design. The organ gallery in the centre of the church and the silver chapel with the choice altar and statue of the Virgin are both conspicuous features of note in this remarkable building, which also contains several other monuments of great interest, such as the *grave of Hofer*, whose body was brought here in 1823 from Mantua, where he was shot in 1810. The organ gallery is situated at the crossing, with the instrument in a rather crowded position below the groining of the nave in the middle of the building in front of the chancel screen. Our present illustration shows the soffit of this organ gallery, and the glimpse into the choir indicates the relative height of the main vaulting or ceiling of the church as compared with the underside of this gallery. We are indebted to "Denkmaeler Deutscher Renaissance,"* by K. E. O. Fritsch, for the view which we have reproduced, and we take this opportunity of directing the attention of our readers to the interesting fact that at last Herr von Ernst Wasmuth, of Berlin, has completed the entire work, and just lately has issued the concluding part to the subscribers, so that the finished publication can now be obtained by intending purchasers. It would be hardly possible to over-estimate the value of such a work to the architect and artist, containing, as it does, so vast a series of permanent photographic representations of some of the richest and most remarkable buildings erected during the best period of the Renaissance in Germany. No doubt much of this work is coarse in detail compared with Italian buildings in this style, or even French contemporary examples; but for quaintness and picturesqueness there certainly is much to admire, if not directly to imitate. The finishing part of the book now before us includes photographs of a timber-built quadrangle at Frankfort, 1587; Friedewald Castle, near Daaden, with its refined stone front of a few years earlier; the bold picturesque Rathhaus at Gandersheim, with its saddle-back tower; some curious old fronts from the same town; the singular arcaded hall of the university at Helmstedt, built by Paul Francke between 1593-1612, and some strangely ornate façades in masonry and wood from Hildesheim, with their suggestive mural elaboration. The octagonal tower of St. Nicholas Church at Leipsic rising above the tall slate-roofed apsidal gables of the building is strangely picturesque; and so is the broad, bold façade of the Rathhaus in the same town. The wooden gallery over the tower entry would not make a bad feature in an English new building of like kind. The great Renaissance house called the Schloss Leitzkau, erected towards the end of the 16th century, with its built-up gables and varied-shaped turrets or towers and bays, is well worthy of the three plates here devoted to its illustration, though in detail the work is too free to be followed. The ceedingly picturesque half-timber pump-house ar Muehlhausen, in the fertile country which tends along the banks of the Unstrut, figures xt; and then, in contrast to it, is the stone çade of the Rathhaus at Münden, in Hanover, a general sense reminding one of the gables ver Messrs. Daniel's china-shops in Wigmore-reet. George Grossmann was the designer one, and Mr. Ernest George the architect the other. Posen, in Prussia, the ancient seat the Polish dukes, is now a "handsome" odern town and a first-class fortress on the rontier of Russia. The peculiar Sclavonic-omanesque Rathhaus in the market-place of this ity is not unlike that at Breslau, and its 18th-entury central fleche-like tower is the tallest in e town. The arcades of the loggia arrange-ent on the three main stages of the façade are articularly good and effective. The fountain in e market-place at Rothenburg has often fur-ished the subject for a water-colour, with the riel over the statue of the Virgin at the corner f a house beyond. The portal of the Rathhaus t Wittenberg,' on the Elbe, has statuary over he pediment and figures on the first stage at the ngles. Wolfenbuettel, celebrated for its vast ibrary and collection of Bibles, has a fine church n the Renaissance style, dedicated to St. Mary, esigned by Paul Francke in 1608. The groined nterior is a very free composition, bold, original, and clever. Two views of it conclude this valu-able volume. The letterpress is alphabetically arranged, with plans and old engravings repro-duced as marginal cuts.

* Denkmaeler Deutscher Renaissance. Herausgegeben von K. E. O. Fritsch (issued in twelve parts). Berlin: Ernst Wasmuth, 35, Markgrafenstrasse.

THE FONT, UFFORD CHURCH, SUFFOLK.

THIS double-page plate is reproduced from a beautiful water-colour drawing exhibited last summer at the Royal Academy by Mr. Charles Maundrell, and although necessarily the charm of colour is lost in our monochrome print, the general balance of light and shade in the original picture is very well rendered by Mr. Akerman's clever reproduction. Ufford Church font-cover is without doubt one of the finest in England, and it retains much of its original colour and gilding. It is hung from the roof by an iron chain, and when pushed up, the lower part telescopes over the upper stages of the spire. When the devastating crew sent by the Parliamentarians visited Ufford in 1644, to demolish all pictures and sculptures, laying bare the sanctuary, they were so far overcome by the exquisite character of the font-cover that their zeal gave way in favour of its retention, as we learn from their report, wherein they said it was "a glorious cover over the font like a Pope's triple crown, with a pelican on the top, pecking its breast, all gilt over with gold." We published full measured drawings of this cover in the BUILDING NEWS for May 18, 1888, the year they were exhibited at the Royal Academy by Mr. H. P. Adams.

PROPOSED CONVALESCENT HOME.

WE have received no particulars descriptive of this building, of which we print a perspective view. The plan shows the arrangement of the interior, with its angle-set day-room and wards at the ends of the main buildings. Colonel R. W. Edis, F.S.A., is the architect, and the drawing illustrated was hung at the Royal Academy Exhibition last summer.

THREE INTERIOR VIEWS OF WESTMINSTER ABBEY, DRAWN BY HERBERT RAILTON.

MR. W. J. LOFTIE's capital book on Westminster Abbey, which was originally issued in a folio form, has just been reprinted and published in an octavo volume* by Messrs. Seeley and Co., and thus this artistic and interesting work has been brought within the means of the many, besides rendering its pages more easy of reference for all. Among our plates will be found three specimen illustrations reproduced from the original etchings to a somewhat larger scale than they appear in the cuts of the octavo book; but they are sufficiently near in scale to afford our readers a good idea of the class of sketches with which the book is elaborated. The original drawings themselves have been on view in the Japanese Gallery, New Bond-street, during the past month, with some other examples of black and white by such artists as Sir Fredk. Leighton, P.R.A., Marcus Stone, R.A., Albert and Henry Moore, A.R.A.'s, Clara Montalba, and others who have been employed by Messrs. Seeley and Co. to illustrate "The Portfolio." Westminster Abbey has had, of course, many distinguished historians—not to mention, within the past thirty years, such antiquarians as Prof. Willis; Rev. Mackenzie Walcott, Dean Stanley, J. H. Parker, Wm. Burges, A.R.A., and Sir Gilbert Scott, R.A., whose "Gleanings from Westminster Abbey" are well known. Dean Bradley, too, has issued of late years a popular handbook. All these have added to our knowledge of the Great Collegiate Church of St. Peter at Westminster, and yet room has been left for Mr. Loftie's more fully illustrated and popular comprehensive summary of its historical records, and showing besides the existing condition of the fabric at the present time. Of the church of the Confessor nothing remains except a doorway high up on the southern face of the transept. The eastern apse is of the building of Henry III. The nave was nearly completed by his son, though Richard II. actually finished it. The chantry of Henry V. must have been upreared while Henry IV. was still a child. The chapel of Henry VII. was really built by Henry VIII., whom, as Mr. Loftie remarks, we habitually think of rather as an iconoclast than as a builder. To James I. are owing the last royal monuments ever set up in the church. Under Charles I. Inigo Jones built Ashburnham House, and Burlington designed the dormitories of the days of the first Hanoverian King. Wren built the north transept front, now pulled down, and one of his pupils the western towers under George II. Cottingham ranks as the first of the modern "restorers" who worked at the Abbey; but little of his time remains—the time when the coronation of George IV. and the novels of Sir Walter Scott helped so strongly to bring about the "Great Gothic Revival." Sir Gilbert Scott, who lies buried in the nave, rebuilt the Chapter House and fitted the choir and the altar, as we now see them, and erected the nave and choir pulpits. He also restored the north portals, and Mr. J. L. Pearson, R.A., the present architect to the Abbey, has quite recently completed the new north front in a way which deserves the warmest praise. Mr. Loftie helps us to realise the site of the abbey as it was a thousand years ago—a low, sandy hillock, called Thorn-Ey, from whence, looking northward and westward, are seen all that remains of the Great Middlesex Forest. The road rises to Tot Hill, which is a conspicuous landmark here, and goes straight on over the "Bulunga Fen" till it reaches another, "the road to Reading," which has just crossed the Tyburn at Cowford, where Brick-street is now in Piccadilly. Tyburn-lane reached the road to Reading at what we call Hyde Park Corner. From the reign of Edward the Confessor Westminster became the headquarters of the King's Government, and the Abbey and its church became the religious centre of the nation, where the highest ceremonials of our land have been performed. In this respect no other place can equal it in interest. At Westminster our kings have slept in peace, and all the varied changes wrought by time, and miscalled restoration, have not been able to obliterate all the charm of antiquity and historical association which cling about the ancient walls. The author holds that the Victorian work carried out in the repair of the fabric should have been more original in style and less based upon models belonging to bygone days, the time of Edward I. or Henry II. Surely he would not repeat at Westminster the Vandalism of a Grimthorpe as witnessed at St. Albans! Mr. Loftie is on safer ground when he turns to the strictly historical record of the fabric and of those who built and used it. In this he has gained no small help from the papers of Professor Middleton and Mr. J. T. Micklethwaite, architect. Westminster has always ranked as a show place. Pepys visited it two hundred years ago, and Sir Roger de Coverley's visit is described by Addison. Visitors from all lands and every sea, whatever else they miss, all go to Westminster, and as a souvenir of such an occasion the book we are now describing furnishes the best form of record which could well be mentioned. The drawings which we publish show the interior of the north transept, made before Mr. Pearson put in the new Rose window,* a general view of the choir from the organ gallery, and a view of the north aisle of the choir apse.

BRITISH ART-WORKERS AND MANUFACTURERS.

(SEE Biographical Sketches on page 4.)

ELECTRIC-LIGHT FITTINGS BY MESSRS. STRODE AND CO.

WE show in our issue of this week a few drawings of works now being executed by Strode and Co., of Osnaburgh-street, St. Paul's Churchyard, and Piccadilly. The bracket and electrolier on the left of the sheet are good specimens of wrought ironwork. The faceted lantern, which is in copper with bevelled glass, has a very effective appearance; it is to hang from the wrought-iron sign made for Heath's of Oxford-street. The wrought-iron desk screen is being made for a bank, and is fitted for both gas and electric-light. Bank fittings are a speciality of this firm. The electrolier in the centre of the sheet, of polished brass, is highly finished, and very artistic. The gates have been executed for Messrs. Ough and Son, for a building they have just erected at Stratford. The panel is a good example of fine ornamental hammered work.

LEGAL INTELLIGENCE.

EMPLOYERS' LIABILITY.—MONTGOMERIE V. JOHN M'KNIGHT AND CO., LIMITED.—In the Second Division of the Scottish High Court of Justice, before the Lord Justice Clerk and a jury, Daniel Montgomerie, Stankard's-row, Uphall, sued John M'Knight and Co., Limited, Binny Quarry, Uphall, for £500, or £78 under the Employers' Liability Act, for the death of his daughter Mary Jane, who entered the defenders' employment in Cardross Brick Works, near Uphall, on 25th May last, and was accidentally killed on 2nd June. After a two-days' trial the jury returned a verdict for the pursuer, and assessed the damages at £200.

IN RE R. LAING, OF DUNDEE.—A meeting of the creditors of Mr. Robert Laing, builder, High-street, Dundee, was held in Lamb's Hotel on Dec. 22nd. The statement of affairs showed liabilities amounting to £3,400, the assets being put down at £1,030, subject to preferable claims, or an apparent dividend of about 4s. 10d. per £1. An offer of 2s. 6d. per £1 was made, but after discussion the meeting adjourned for a week.

RE C. W. WARD.—The receiving order in this case was made on Dec. 3, the debtor trading as a builder and contractor at 150, Minories, under the style of C. W. Ward and Co. A summary of the accounts has now been issued, the liabilities being returned at £2,864, and the available assets at £5. An order for summary administration has been made.

WATER SUPPLY AND SANITARY MATTERS.

WATFORD.—Mr. S. J. Smith, C.E., Inspector of the Local Government Board, held a further inquiry on Thursday last with reference to the application of the Watford Union Rural Sanitary Authority for sanction to borrow £23,600 for the purposes of sewerage and sewage disposal for the contributory place of Bushey. The Hon. Sidney Holland, instructed by Messrs. Sedgwick, Turner, and Oddie, and Mr. Urban Smith, A.M.I.C.E., the engineer to the Sanitary Authority, supported the scheme. The chief matter before the inspector was as to a suggested combination between the contributory place of Bushey and the Local Board of Watford, for sewage disposal purposes, which had been favourably reported on by Mr. Urban Smith. The Local Government Inspector expressed himself as strongly in favour of such a combination; but as the members of the Local Board present still declined to agree to the proposal, the inspector intimated his intention of reporting at once upon the separate scheme.

A new workmen's club in High-street, Lyndhurst, was opened on Tuesday week. It is Elizabethan in style, and has been built by Mr. Ernest Gale of that town, from plans by Mr. J. H. Roberts, who acted as honorary architect.

The temporary hall, at Exeter, now being built for the purpose of a meeting which the Marquis of Salisbury will address, on the 19th inst., has been designed by Mr. Jerman, architect, of that city. It is octagonal in form, with an extreme length of 262ft., and a width of 220ft., and the height is 30ft. The roof is of wood, covered with felt, and will be crowned by lattice-work girders, resting on pitch-pine posts 11in. square. The building will be seated for 10,000 people, and will have thirteen exits, each 10ft. wide. The contract has been taken by Mr. Henry Phillips, of Exeter, and the cost will be about £1,200.

---

* Westminster Abbey. By W. J. LOFTIE, B.A., F.S.A., with Illustrations by HERBERT RAILTON. New edition, revised. London: Seeley and Co., Limited, Essex-street, Strand. 1891.

* See BUILDING NEWS for June 5, 1891, for photograph of new front. Sir Christopher Wren's autograph drawing of it, dated 1719, will be found in our issue for October 26, 1888, and Sir Gilbert Scott's new portals were illustrated by us in the BUILDING NEWS for May 3, 1878.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—H. B. and Co.—C. and Co.—H. C. W.—D. and C.—J. and Son.—G. B. and L.

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

C.—A Parish Hall for a site in the middle of the roadway of a village street, with a trough for horses and a drinking fountain attached. The land available for building is a triangular piece 90ft. long, 30ft. wide at east end, and 55ft. wide at west end. Roadway both sides, north and south, running east and west. The main entrance to be at the east end. The fountain to be in the wall at the west end. The accommodation to comprise a hall for entertainments and parish meetings, with a small recessed stage at one end; a small retiring-room available for committee meetings, a w c. and small lavatory, and a gallery is to be provided at the entrance end of the Hall. Style suitable for stone walling, and stone slab slated roof; scale, 8ft. to the inch. Plans, 3 elevations, and a section with perspective view.

Drawings Received.—"Western," "Hubby," "Gobo," "Nimrod," "Pastime," "J" in a circle, "Sanitas," "Albyn," "Cotonopolitan," "Symbol," "Kentish Rag," "Black Prince," "Aryshire," "Black and White," "Sweet Auburn," "Firefly," "Pen," "Spider," "Red Lion," "Orient," "B" in a circle, "Norman," "The Idler," "Pendragon," "Hut," "Hales," "Forward," "Gradatim" (Stockport), "Ray," "Red Brick," "Ilex," "John Jones," "Gradatim" (Ipswich), "Tempus Fugit," "Punch," "Hardwick," "Hilarius," "The Useless One," "Wit," "Herbert," "Goblin Grey," "Tyro," "Yorkshire Tradition," "Terracotta" (no name and address), "Grandison," "Ich Dien" (no name and address), "Devil's Chimney," "Nodrah," "Forward," "Sunset," "Sector," "Ko Ko," "McGinty," "Love's Labour," "Jean."

Correspondence.

THE ARTY-CRAFTY ARCHITECT.

To the Editor of the Building News.

Sir,—The letter appearing in your last issue under this heading hardly deserved its title, being, in point of fact, a defence of the crafty but artless architect to whom the writer thinks the Architectural Association should alone give ear. As a member of this body by no means new to "bricks, mortar, and the builder," however, I failed to find in Mr. Jackson's paper anything calculated to injure the "receptive mind" of the student, or to call for the awful warning to parents and guardians that Mr. Woodward advocates. Such a letter could, I think, only be justified by a complete exposition of crass ignorance on the part of his opponents. Does this indeed exist? Are Mr. Norman Shaw and Mr. Jackson, for instance, so ignorant of the A B C of construction as to require "relegation to the rudiments of their business"? Their work does not show it, and Mr. Woodward's letter certainly does not prove it. Ignorance so well concealed is a covetable commodity.

It was not Mr. Jackson's paper, but Mr. Kerr's contribution to the discussion thereon, that struck me—an impartial observer of the controversy—as injurious—indeed, as cruel in the last degree; for it is cruel for Mr. Kerr to attempt to deprive the younger generation of that enthusiasm that he gives us to understand he himself possessed in his youth. Without it, perhaps, he had failed to invest his buildings with even that trifling modicum of art that he tells us the British public desires.

It is sad, but not altogether surprising, to learn that the late Mr. Sedding and all his works fall under Mr. Woodward's ban. Some few of us have seen a little to admire in them hitherto; but since they are not according to the gospel of Southampton-street, I suppose we must cry "Peccavi," and recant. Seriously, the A. A. having gone so far with the Institute in their new departure, is it not fair that the other side should have a hearing? Mr. Woodward's case must be weak indeed if it can only be served by the muzzling of his adversaries, and a stretching in his favour of parental authority. This last, too, he is most unlikely to obtain, for the public views the great architectural controversy with complete indifference, musing—"Strange that such difference should be, 'twixt Tweedledum and Tweedledee."—I am, &c.,

Alfred C. Houstone.

13, Furnival's Inn, E.C., Dec. 24, 1891.

MR. JACKSON AT THE ASSOCIATION.

Sir,—The address of Mr. Jackson at the Architectural Association is most remarkable. His advice to the young seems to be so misleading as to be most dangerous.

He recommends them to "shut their books, and, flying off to the workshops, learn how to design in a way that gives the workman no unnecessary trouble, makes the most economical and reasonable use of the materials," &c.

Should any student venture to put this advice into practice with the first building intrusted to his care, it would be likely to place him at such disadvantage at the outset of his career, that it might take him years to recover therefrom. The workman will readily advise how to take out the unnecessary tasks and unprofitable labour, and with these will be weeded out the art and the beauty. Why, in perhaps nine cases out of ten it is just this "unnecessary trouble" and "unprofitable labour" that give the beauty to the design. Why, Sir, the very advice here given to the student is that from which architecture has most severely suffered in the past, and the public have been most quick to learn—viz., to consult the workman direct, and to take his work with all the unnecessary labour and the unprofitable work left out.

But it was with reference to the examinations in architecture that I took up pen, and it is here that the advice given is so remarkable, especially when given by a M.A.

Mr. Jackson says: "They put before him a wrong motive. He learns, not in order to know, but to pass." Surely if Mr. Jackson admits that "he learns," he will not quibble as to the reason why. "He learns," says Mr. Jackson, and therein do all right-thinking men rejoice. Anything that forces a man to learn, need not be too inquisitively examined. It is surely the learning we require: the motive thereof we may well leave, if this be gained.

His next accusation against the examination is that it forbids the student to linger over some special bias or particular branch. Again, Mr. Editor, a distinct advantage, one would think. Most certainly anyone with a general knowledge over such a wide range as is covered by the Institute examinations is much better prepared for the special study of some particular branch than is one who has given all his time to one thing, and has never ventured to look abroad upon the pressing questions and varied knowledge awaiting him on every side.

At one moment Mr. J. calls the system of the examinations "a clog," the next minute he calls it "a cram." But a cram is the very opposite to a clog—it is an incentive, an urging forward. Yet Mr. Jackson admits that "In order to pass, the candidate must answer a certain number of questions on a wide range of subjects." And with this admission he practically admits the worth of the examinations and the extent of ground they cover.

One reason of accusation he finds in that the Institute examines, it does not teach. What of this? The teaching is obtained, though not from the Institute, in some other way. The teaching, which but for the examination would not be sought, is obtained, and much good thereby gained.

The remark that these examinations "will infallibly fail to keep out those who are unworthy, and will probably shut the door in face of some Heaven-descended genius whose originality you may fail to appreciate" is astonishing. What would the examiners of Oxford or Cambridge think of the plea of the undergraduate they had just ploughed that "They had failed to appreciate his originality."

Besides, Mr. Editor, it is not originality merely that is required. It is originality *only* when it is accompanied by knowledge that will be found of any service.

Mr. Jackson's allusion to the present members of the Institute is in bad taste as well as beside the mark. If, as he says, a good many would be found outside—if this be true, then does Mr. Jackson wish it to continue? The present members of the Institute never had the advantages of examination; and it is chiefly because of the lack of any real training in the past, or rather, because of the enormous difficulties of getting such training in the past, that the importance is now seen of placing these advantages in the way of the architectural students of to-day; and that this is needful alike for the students and for the public at large, who will be their clients.

Perhaps the most extraordinary statement is to come. Mr. Jackson says—and it is a remarkable statement—"The majority of candidates are, and must be, mediocrities; and you will have to admit them with their middling gifts, and to suit your standard to their capacities." No, Mr. Jackson; the day is over for that. We object decidedly to have a majority of architects who are "mediocrities," and to be content with their "middling gifts."

We will not suit our standard to such capacities. We purposely raise it above them. The architect of the future must not be a "mediocrity." He must be the best that can be. He must have the best and most efficient training; that training must not be confined to the student's "special bias"; it must be sufficiently wide to embrace all he needs to know, and all the knowledge the public have a right to demand; and that training must lead to examinations that shall give a knowledge of competency and the possession of conscious strength to those who pass.

J. W.

ARCHITECTURE OF THE RENAISSANCE.

Sir,—Permit me to point out to you that in your notice, under the heading of the third part of Messrs. Gotch and Brown's work, you are in error in stating that the two photographs representing Knole House are by Mr. Essenheigh Corke, and as these are two of the finest yet issued, you do some unintentional injustice to Mr. Charles Latham, of Balham, who has taken the whole of the photographs for this work, *including the two in question.*—I am, &c.,

B. T. Batsford, Publisher.

52, High Holborn, London, Dec. 29, 1891.

* * *

The pupils of Mr. T. J. Moss Flower, C.E., consulting sanitary engineer, Bristol, succeeded in gaining twenty-two and twelve successes respectively at London and Manchester examinations held for sanitary inspectors by the Sanitary Institute, December, 1891, all passing, with very few exceptions.

The Wesleyan chapel at Hawkshaw-lane, near Bury, erected from plans prepared by Mr. H. Leonard Hinnell (Proctor and Hinnell), civil engineer, architect, and surveyor, Bolton, has been opened. The chapel is stone built, being faced with Yorkshire parpoint, having Holcombe stone quoins and mullions, and it is capable of seating about 230 people. The contractor for the work has been Mr. Jas. Byrom, Woolfold, Bury.

Intercommunication.

QUESTIONS.

[10685.]—**Soils.**—Could anyone give me any information as to the respective weight that may be safely borne by different kinds of soil, and in what book I could find the same, especially what weight per square foot on good sand foundation?—LA TERRE.

[10686.]—**Bookkeeping.**—Would a correspondent kindly recommend a good system of bookkeeping for builder and contractor?—SEVEN YEARS' READER.

[10687.]—**Damp.**—I have several cases of 11in. hollow brick walling, put together in the usual way, with galvanised-iron ties, where the damp is carried through the wall by the brick headers adjoining the reveals of the windows. Can anyone recommend a preventive, or any solution that could be applied to the bricks to stop the suction and would not discolour them? The moisture dropping upon the lintel over the window is carried off by a small lead gutter in the cavity.—A. R. N.

Legal.

ABOUT TENDERS.

OF course, there are cases in which owners begin to build without any contract as to price, and when this is done they have to pay whatever a Court may ultimately decide is fair and reasonable, and upon a valuation of the work done, and the materials provided, which work can be and is measured up for that purpose. But the usual and safe course to pursue is to have estimates or tenders for the building to be erected sent in by the builders who like to make an offer about the job. The architect generally gets in the estimates or tenders as they may be advertised for, as they frequently are in large concerns. An invitation to tender for any building can be revoked at any time by the person so inviting tenders, and providing, of course, that this revocation takes place before there has been any acceptance on his part when an advertisement for tenders is thus withdrawn or revoked. There may be some hardship on the persons tendering, for there is no means by which they can recover any expenses they may have incurred in so doing. In fact, an announcement that tenders will be received is, in law, in the same position as a declaration that a public sale will be held at a particular place or upon a certain date. In such a case it has been decided that a person acting upon the advertisement, and incurring expenses in consequence, could not recover them from the auctioneer or anyone else, as the mere invitation to attend a sale did not amount to a contract or warranty that a sale would be held, and the same argument applies to an invitation to tender.

Then, again, it is clear law that there is no obligation on the part of the person inviting tenders for work to accept the lowest or any other tender. To invite tenders is, legally speaking, only one way of trying to find out if certain works can be carried out at a price which the owner or architect thinks is profitable or satisfactory. This mere proposal to others to say what they would do the work for cannot make any sort of contract enforcible against the party so proposing. It is usual to add a clause in such advertisements and invitations stating expressly that the building owner does not bind himself to accept the lowest or any other tender. This is done from motives of precaution; but in law it cannot be needed. It is true there is one case in which the Court appears to have considered that there might be a binding custom in a particular trade to accept the lowest tender. But this decision, when looked into, turns more upon the conduct of the parties and facts showing that the tender had been accepted than upon any such custom, and it certainly cannot be regarded as a general authority.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

G. C. J.—LATERAL SUPPORT.—NEGLIGENT SHORING.—If you can prove that the damage to your house arose by reason of the excavation and defective shoring by your adjoining neighbour, he would be legally liable in damages for the actual injury done in consequence. You should call upon him to make it good, and had better give the same notice both to him and his builder.

Our Office Table.

MR. WILLIAM SMITH, of Aberdeen, architect of her Majesty's Castle of Balmoral, died on Thursday night in his 74th year from an attack of bronchitis. Mr. Smith was born in 1817, and was educated at Marischal College, Aberdeen, where he graduated M.A. After travelling in Greece and Italy for the purpose of perfecting himself in his profession, he returned to Aberdeen in 1842, and ten years later succeeded his father as city architect, an appointment which he held until his death. He erected many of the churches and public buildings in Aberdeen. When her Majesty and the Prince Consort determined upon erecting a new castle in the Highlands, Mr. Smith was chosen to design the building and to superintend its erection, and Balmoral was the result. Mr. Smith erected many other private mansions, schools, hospitals, &c., in various parts of Scotland. He married, in 1846, a daughter of the late Dr. Patrick Blaikie, of the Royal Navy, who predeceased him; one of his sons is Mr. Garden Smith, an Edinburgh artist.

THE Northumberland County Council, in addition to promoting classes for plumbers' apprentices at different local centres, with a view to their obtaining the certificate of Registration offered by the Worshipful Company of Plumbers in London, has appropriated £50 for the purpose of providing facilities early this year for a few practical men to pursue a course of training for three weeks at the College of Science. It is hoped that other county councils in the northern district will do the same, and at the annual general meeting of the district council for the North of England a resolution was carried to that effect. Another resolution urged the necessity for securing the greater sanitary efficiency of plumbers' work by an organised and efficient system of registration, which could only be secured by a council of competent jurisdiction and authority having Parliamentary powers.

THE prizes given by the Carpenters' Company were recently distributed by Mr. Henry Harben, L.C.C., the Master and many of the past masters of the Carpenters' Company, Dr. Henry Wace, and many of the professors being present. There were many members of the British Institute of Wood Carvers at work in wood-carving room. There were microscopes in Professor Grove's room, showing specimens of wood and stone, limelight views in the drawing-room of the various styles of architecture, with explanatory notes by Professor Banister Fletcher, a splendid collection of wood carving belonging to Mr. Rogers, and diagrams and instruments explained in the new electrical laboratory. The students' drawings were hung on the walls, and also photographs, drawings, architectural and constructional, in the reference museum and architectural corridor.

◆

Despite the facts that there are some 2,500 cesspools in Chichester, and that the inhabitants of 816 houses obtain their water from wells, the non-drainage party of the Town Council of that city, the *Brighton Advertiser* remarks, have, by a narrow majority given them at the last municipal election, decided to abandon the proposed drainage scheme, in favour of a system of cesspool cleansing in use at Bexley. The cost of the plant for the project adopted is not to exceed £200.

Mr. John Shillitoe, of Bury St. Edmund's, the head of a well-known firm of builders and contractors, died on Wednesday week. The son and grandson of builders, Mr. Shillitoe was born at Campsie, near Doncaster, in January, 1833, and was, therefore, in his 59th year.

The death is announced of Mr. William Wilkinson, head of the firm of Messrs. B. Cooke and Co., of Phœnix Wharf, Battersea. The deceased was well-known in the railway and contracting world. He was 67 years of age, and died at his residence, Aubrey House, Albert-road, S.W. He is succeeded in the business by his only son.

The Rotherham School Board have instructed their architect, Mr. H. L. Tacon, of 11, Westgate, Rotherham, to prepare plans for a new school to accommodate 700 children. The site has been approved by the Education Department.

It has been practically decided, with the active concurrence of the authorities at the British Museum, to establish a course of University Extension lectures in Greek art at the British Museum, primarily for artisans, and at popular prices.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Discussion on "Party and Party-Fence Walls." 8 p.m.

TUESDAY.—Glasgow Architectural Association. "An Italian Tour," by C. R. M'Intosh. 8 p.m.

WEDNESDAY.—Civil and Mechanical Engineers' Society. "The Square Drilling Machine and its Uses," by Reginald Bolton, Vice president. Westminster Palace Hotel. 7 p.m.

◆

CHIPS.

At a meeting of the Stoke-on-Trent Rural Sanitary Authority, held on Wednesday week, nine applications were received for the office of surveyor to the authority. Mr. G. W. Bradford, of Hanley, was elected. The appointment is worth £50 a year.

A stained-glass window has been inserted in the parish church of Uttoxeter. The subject is "The Presentation of Christ in the Temple," and the work has been executed by Messrs. Ward and Hughes, of London.

St. Thomas's Church Schools, Stanningley, are about to be enlarged, from designs by Messrs. J. Kendall and J. H. Bakes, M.S.A., architects, Leeds and Idle.

Mr. Robert Stephenson, of the firm of Messrs. R. Stephenson and Co., engineers, of Newcastle-on-Tyne, who died suddenly at San Remo last week, was a son of Mr. George Robert Stephenson, and a grand-nephew of George Stephenson, the eminent engineer. He was in his 43rd year.

The extensive timber works and saw-mills known as Brakewell's Saw-Mills, Whalley-road, Clayton-le-Moors, near Accrington, belonging to Mr. R. Howson, were destroyed by fire on Saturday.

Helpringham Church, South Lincolnshire, which has been undergoing restoration in consequence of the collapse of its roof last year, was reopened on Tuesday by the Bishop of Lincoln.

A second theatre in Portsmouth, the Prince's, in Lake-road, Landport, was opened on Saturday afternoon. The building, which is from the design of Mr. F. Matcham, of London, will accommodate an audience of about 1,500.

◆

Holloway's Pills.—A course of this admirable medicine clears the blood from all impurities, and improves its quality. The whole system is thus benefited through the usual channels without reduction of strength, shock to the nerves, or any other inconvenience; in fact, health is renewed by natural means.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXII.—No. 1931.

FRIDAY, JANUARY 8, 1892.

LONDON BUILDING LAW (CONSOLIDATION) BILL AMENDMENTS.

IN our last issue we referred to the amendments suggested by the Building Act Committee to the Metropolitan Building Acts, and we think it will be of service to many of our Metropolitan readers if we give a brief *résumé* of those of special importance. A few weeks ago we examined the draft of the Consolidation Bill prepared by the Local Government Board, and noticed some of the sections of the old Act proposed to be repealed and the corresponding clauses of the Bill. This is the Bill which the Building Act Committee have had under their consideration. In December last, the Local Government Board wrote to the Building Act Committee, asking them to consider the Bill, and offer any amendments they might deem desirable. The suggestions now submitted by the Committee to the Local Government Board (yet to be confirmed by the Council) for embodiment in a Government Bill are the result. Several conferences between the Building Act Committee and the President of the Local Government Board will, no doubt, take place before these suggested amendments and any others are adopted. Time is therefore afforded for discussing the amendments, which will very considerably alter the law as to building in the Metropolis. The suggestions for a draft Bill made by the Institute of British Architects, of which we have given a partial *résumé*, are also worth attention.

The suggested amendments of the Building Act Committee begin with the rules as to "Recesses and Openings," section 2 of the Consolidation Bill. It is proposed in recesses made in party-walls that every recess should have an arch of at least two rings of brickwork of the full depth of recess on every story. The present clause merely says every recess is to be arched over. In the taking down or rebuilding of party-walls the amended clause will insure stability. After section 4 it is proposed to insert regulations to insure the strength of bressummers and flooring-joists—a very important amendment, and one which we have called attention to more than once. The old clause or rule with respect to bressummers merely says that "every bressummer shall have a bearing of 4in. at least at each end upon a pier of brick or stone, or upon a timber or iron story post"; the amended clause makes it read: "Every girder, beam, or bressummer, if of wood, &c." In addition to bearing upon any party-wall, the words, "or external wall, and, if necessary in the judgement of the district surveyor, shall have in addition such other story posts, iron columns, stanchions, or piers of brick and stone on a solid foundation under the same or corbels," are proposed to be inserted, thus meeting cases of building where the superstructure would be too lofty or heavy to be carried on piers of brick or stone, or story posts at the ends. After subsection 3 it is proposed also that the end of a timber not permitted to have a bearing on a party-wall may be carried on a corbel or templet of stone, iron, or vitrified stoneware tailed into the wall at least 9in., &c. The scantlings of joists proposed for domestic buildings are urgent. The minimum sizes are given for bearings up to 21ft. Thus a bearing of 11ft. is to have joists of 9½in. by 1in.; a bearing of 15ft., 10½in. by 2in.; of 17ft., 11½in. by 2in.; of 21ft., 13in. by 2in.; or an equivalent sectional area not less than 7in., 9in., 11in., or 12in. deep respectively. Trimmer joists are not to be less than ½in. thicker than the ordinary joist; joists are not to be more than 12in. apart, and to have a course of strutting if they exceed 10ft. up to 18ft., after that two courses.

To give easy access to roof in case of fire, a useful amendment is made to section 8. Every dwelling-house having a parapet is to be provided with (1) a dormer window or door on to roof, (2) a trapdoor furnished with a fixed ladder leading to roof, (3) or with proper means of access to roof. Several useful insertions of qualifying words and substitution of words are proposed after section 9, referring to rules as to chimneys and flues. A very desirable change is made in substituting the words "fire resisting" for "fireproof" in sub-clause (4) of section 9. Fire-resisting piping of stoneware is provided for the lining of flues. After section 9 rules are inserted for the construction of detached chimney shafts of factories. Briefly, the requirements are that they be carried up on brickwork and mortar of the best quality, and taper at the rate of at least 2½in. to 10ft.; that the thickness of the top of shaft 20ft. shall be at least 9in., and increased half a brick for every 20ft. measured downwards; that the cap, foundations, and footings shall be made to the surveyor's satisfaction.

Another amendment that will render low rooms impossible is the proposal to increase the minimum height of habitable rooms from 7ft. to 8ft. (sect. 12), and every such room is to have one or more windows opening directly into the external air, with a total superficies clear of sash frame of at least one-tenth of the floor area, a portion of which, at least 7ft. from floor, is to open. If the room is in the roof, and there is no external wall, it is to have a dormer window, at least one-twelfth of floor area. Every basement room floor is to have a ventilated air-space between ground and floor, except when it has wooden blocks on concrete. Another clause, 12*a*, provides ventilating skylight, or window, for every dwelling-house staircase. Section 15 (2) it is proposed to make it clear that no shop front shall project "on, or over, the public way." The construction of oriel windows in streets 40ft. wide is another point. It is suggested that in a street of not less than 40ft., projecting oriel windows, or turrets, may be constructed, provided that no part of the projection extends more than 3ft. from face of building, or more than 12in. over the public way; that no part of it is less than a certain number of feet above the footway, or is within a distance of 4ft. of the centre of the nearest party-wall, &c., and that it is built to the surveyor's satisfaction. Section 16 (*b*) it is provided that separate sets of chambers, tenanted by different persons, if contained in a building exceeding in area 25 squares, shall each be deemed to be a building, and the same to be separated by party-walls, or horizontally by fire-resisting arches and floors.

We now come to a very valuable amendment, the object of which is to provide a sufficient open space at the rear of small houses. The committee, at the suggestion of their architect and medical officer, propose that so much of the Model By-laws shall be adopted as will give a space of 20ft. between buildings in the rear, or 10ft. to each. It is proposed (section 18) that for every new domestic building an open space in the rear is to be provided of not less than 150sq.ft., free from every erection except a water-closet or receptacle for ashes; but these erections are not to exceed 9ft. in height. For other buildings the height is limited to 12ft. for such erections. This space is to extend the whole width of the building, and to be not less in any part than 10ft. A diagram is given to show the method of regulating these areas for dwellings. This is practically adopted in Liverpool—viz., a line is drawn from the rear boundary of plot towards the house at an angle of 45° with the horizon, and up to this line any buildings may be erected, provided that no part of them, except chimneys, dormers, gables, &c., pass above this inclined line. The oblique boundary-line of 45° is to be taken from a horizontal line level with the street in front of the said building. By this method of regulating space every building, whatever its height, will have an open space in the rear proportional to its size. The principle, while it does not necessarily interfere with an owner's rights, treats every house fairly. The angle, too, is that one which custom has sanctioned for ancient lights. We have now no rule. Houses can be built so close in the rear as to overshadow each other, and there is only a legal and expensive process applicable. The committee propose to treat existing buildings in this way: If a building is burnt and pulled down, the owner may (clause 11) rebuild it to the same dimensions (these having been recorded previously to pulling down), provided he makes an application to the surveyor for that object. Under existing law, an owner may pull down a low building and erect on its site one of 90ft.—a grossly unfair act towards his neighbours. This amendment is not to apply to towers and spires of public buildings. It is provided also that if the rear building is irregular, so that a doubt arises as to how the measurement is to be taken, the Council are to decide; also (7), in the case of a corner building abutting upon two streets, the Council may permit an erection not exceeding 15ft. upon so much of the rear space as may be thought fit, so as not to obstruct light and air to adjoining buildings; or (8) the Council may vary and allow modifications, provided that subsection (1) be complied with. Other subsections are inserted to which we need not refer.

As to height of buildings, while it is proposed that the Council can use their discretion, a limit of height of 75ft. is inserted for the 90ft. in the Consolidation Bill, exclusive of two stories in the roof, and of ornamental towers or features; it is also proposed to omit subsection (*c*) of clause 3, which permits any building in a continuous block to be carried up to a height equal to any other, if such height exceeds the prescribed limit. The rights of owners of adjoining grounds (Consolidation Bill, sections 50 to 63) are proposed to be simplified by clause 50*a*. Where the grounds of different owners adjoin, and the owner of one piece is about to build on the line of junction, certain provisions are proposed: the chief is that if the adjoining owner consents to the building owner erecting a wall on the line of junction, the wall is to be built half on the ground of each owner, and the expense shall be borne from time to time by the two owners, in proportion to the superficial content of which they respectively make use; but if he does not consent to the party-wall, the building owner shall not build the wall except as an external wall on his own ground. After section 77, 63*a* provides that nothing in the Act shall interfere with an easement of light in, or relating to, a party-wall, or affect any person's right to preserve or restore any light in any party-wall being pulled down and rebuilt. Another important amendment is the appointment by the Secretary of State of a special magistrate to deal with cases under the Act, and thus to provide for greater uniformity. A clause is also proposed after sect. 97, exempting sheds for bicycles, &c., and window cases from the provisions of Act. Such buildings are not to exceed in area 30sq.ft., and not to be more than 5ft. to the eaves, and distant not less than 5ft. from any other building. Several other structural provisions, as those referring to new churches and chapels (98*c*), requiring staircases supported and inclosed by brick walls, and staircases and corridors to be not less than 4ft. 6in. wide, are introduced, but of these, and other amending clauses respecting the definition of terms and rules for thickness of walls, we must speak hereafter.

OLD MASTERS AT THE ROYAL ACADEMY.

A VERY fine collection of pictures by the Old Masters and deceased British artists, including a very valuable series of water-colour sketches and drawings by J. M. W. Turner, John Sell Cotman, Daniel Cox, Copley Fielding, Old Crome, Peter de Wint, and William Hunt, are to be seen at Burlington House. Among the contributors are the Queen, who sends five paintings of the Old Masters from Buckingham Palace; the Earl of Dudley, Lady Wallace, Ralph Bankes, the Executors of the late E. H. Lawrence, Charles Morrison. In the first gallery we meet with works by British masters. Thomas Gainsborough is represented by several landscapes and portraits. The broad, bluish-toned landscape (4), a wooded and hilly scene, is full of rustic charm; the portrait of Mrs. Portman of Bryanstone, lent by Viscount Portman, one of the painter's best, is a full-length, seated figure of the lady in white, richly trimmed with lace—a superb but rather colourless portrait; that of Mrs. Billington, actress and singer, who first made her appearance at Covent Garden in 1785, is pleasing; the attitude leaning forward with arms resting on a cushion, attired in white open dress and blue sash. Other portraits of his are Nos. 24, 29, and 34. The portraits by Sir Joshua Reynolds include one of Miss Muse (8) lent by the Earl of Normanton, a rather prim-looking young lady in grey and pink, with lace front, and a low, flat pink-lined hat; and portraits of Josiah Wedgwood and his wife (21, 20). The eminent potter is painted half-length, with red coat and wig, and the wife in black, with powdered hair and white lace cap. The usual landscape or architectural background is substituted by brown and grey. Two very fine specimens of Richard Wilson, 1, "Apollo and the Seasons," a classic landscape with figures of the Seasons dancing in the foreground, and sunset effect; and the other, "Cader Idris" (7), a valley with mountain distance—a splendid example of Wilson's serene style—are worth attention. "Snowdon" (40) is rather hard. "The Village Festival," by Sir David Wilkie, is a finished sketch for picture at the National Gallery, dated 1809. The grouping and tone of the courtyard of inn, the dancing and movement and light, are equal to this master's work. The "Decollated Head of the Duke of Monmouth," by an unknown painter, lent by Mr. Seymour Haden, is a clever but unpleasing subject. The head lies on a low pillow with white drapery round it, the countenance placid. It is supposed to have been painted for Lady Henrietta Wentworth, Monmouth's mistress. Sir Henry Raeburn, R.A., is represented by a nice face of Mrs. Smith, in No. 5; George Morland by a work of splendid quality, "The Straw-yard" (13), the large tree, light and shade, and horses are admirable in tone; so is the landscape (16), and the "Sea-shore" (31), a stormy shore scene, in fine colour. The large picture by William John Müller, "Eel-Bucks at Goring" (11), said to have been painted in one day, is a landscape of much power, reminding us of the showery skies and glistening foliage in its flickering lights and vigorous handling of Constable. The coast scene by Richard P. Bonington (18) is clear in colour and decisive in the drawing of figures; a finely-luminous rough sea is by J. M. W. Turner, "The Whale Ship," with whale dying, and the ship in danger; also his "Queen Adelaide Disembarking at Southampton on her Return from Malta" (23), a grand picture of misty sunlight and brilliant craft. In both the stormy waves and the harbour scene we see Turner's power and poetic feeling. A clever head and expression is the portrait of William Hayley (25), by George Romney, whose pleasing and graceful portraits of the Countess of Derby (27) and the Hon. Charlotte Clive (36) are also hung here. Examples of John Crome, especially a fine woodland scene (28), with well-managed light through a cloudy sky—a Norwich scene—another of Yarmouth Beach (39) and the Harbour (42), exquisite in tone and drawing, and one or two by J. Sell Cotman (35), together with a fine warm landscape, "Sunny Thames" (32), by Frederick Walker, A.R.A., a view of the river's brink bathed in a sunlight glow, with a group of children on the bank—an unfinished but very admirable example of breadth and colour—are noteworthy.

Gallery II. is chiefly devoted to Dutch masters, examples of Teniers, Cuyp, Jan Steen, Ostade, Wouverman, Hobbema, Ruysdael, Both, Metsu, and others being hung. An Antoine Watteau heads the list. "L'Accordée du Village" is a delightful specimen of grouping of figures and colour. Following come a small charming and feeling landscape by Jacob van Ruysdael (45)—a delightful interior, with lady playing a guitar—a very dexterous study of crisp handling and chiaroscuro by Jan der Meer (46); a woodland by Jan Both; Godfried Schalcken (49), "Stolen Kisses," a clever study of candle-light effect and execution; an admirable example of Wouverman (51), "The Charlatan, or Country Fair," full of movement; an "Avenue" (53), by Albert Cuyp; and "A Christening Scene," by Jan Steen (56), the two last lent by Lady Wallace, the latter picture animated, full of humour and character. A large Cuyp (55), a landscape on a wooded knoll, with a riverside inn, shows this painter's powers as a colourist and delineator of atmosphere and stormy skies; a reputed Van Dyck from Lord Hylton's collection, representing the classical legend of the hero Rinaldo asleep with Armida leaning over him, entwining a flowery wreath round his head, is glowing and rich in colour. Other pictures include a fine view by Jan Van der Heyden (58), a low-toned landscape or woodland by Hobbema (67), another landscape by the same painter, in Lady Wallace's collection (71); a Francis Snyders—a very large interior or dining-room, into which a stag has rushed, making fine havoc of dishes and plates (69); a clever animal group by Hondecoeter (70); a landscape by Ruysdael, admirable in colour (72). A familiar subject by engravings is Van Dyck's large portrait subject of Dorothy, Countess of Leicester, and her sister, the Countess of Carlisle—three-quarter figures seated opposite each other in low-necked dresses of white and red, with jewelled armlets. A few pictures by David Teniers, from Mr. Morrison's collection, notably Nos. 82, 87; a clever Van Ostade, a tavern interior (80), full of life and character; two charmingly executed and finished subjects by Gabriel Metsu (91, 95), lent by Lady Wallace; a finely-painted Paul Potter—"Young Bull and Cow"—lent by the Queen; and a pleasing landscape by Wouverman (96) are irresistible subjects.

The large gallery is crowded with samples from various masters of the Italian, Flemish, and British schools. Sir Joshua Reynolds holds the end of the gallery. A portrait of the first Viscount Lifford, the judge of the Court of King's Bench, Lord Chancellor of Ireland, 1767, shows the chancellor in his robes, holding the purse; the same painter's familiar picture of Miss Bowles (102), a bright-eyed little girl clasping her dog, with landscape background, engraved by Cousins, in the Wallace collection. The large centre picture by Reynolds, "Death of Dido," lent by the Queen, is rich in colouring, if we cannot admire it as a composition. Two graceful specimens of portraiture are on each side, one of Mrs. Braddyll (107), a finely and delicately painted and handsome face, the half-figure in white dress and black mantle, and powdered hair, and the portrait of a girl seated under trees (106), a graceful and poetised presentment. Some splendid colour and stormy cloud painting, with amber-toned sea, meet us in Sir A. W. Callcott's fine sea-piece (101); a fine Morland is numbered 104, a grey-toned bay; a Claude-like Turner, "The Lake of Geneva" (108), with the Castle of Chillon in the middle distance; Reynolds's portrait of the Earl and Countess of Ely (109), a large corner picture. Examples of several Italian masters ars hung. The "Adoration of the Shepherds" (112), by Giorgione, is warm in colour, and crisply handled. The figure subject attributed to Titian, "Omnia Vanitas," has some good modelling and colour, and his "Triumph of Love" (115) is characteristic. Tintoretto is the reputed painter of 117, "Apollo and Marsyas," a composition of sufficient merit and vigour and colour to claim the authorship. A fine Claude (120) and a notable specimen of Andrea del Sarto's chiaroscuro and softness of shading is seen in his "Virgin and Child" (121), lent by Lady Wallace. Two large portraits of La Marchesa Grimaldi (125, 128), by Rubens; a fine example of Frank Holl's portraiture of "A Man" (124), lent by the Queen; a large, richly-coloured composition of "Cupids, Fruit, and Flowers," the latter arranged as a festoon above the cupids, by Rubens and Snyders (126) are to be seen at the further end of gallery. Turner's "Sea-piece" (131), a dark, cloudy painting, is not so characteristic as "View of Petworth House," in which there is some nice grouping and light (133)—both early pictures, belonging to Lord Leconfield, and to be contrasted with the more idealised picture of "Walton Bridges" (140), full of gradation of tone and light. Another great work is Constable's "Opening of Waterloo Bridge," lent by Sir C. Tennant, which is full of sparkling light and colour, added to three admirable portraits by Romney (132, 138, 141).

In the fourth gallery is an interesting collection of Early Italian and Flemish masters, two of them ascribed to Botticelli, a fine "Pieta" by Crivelli, and a Crucifixion ascribed to Raphael, both of them belonging to the Earl of Dudley. The "Virgin and Child with Saints" (161), the latter with embroidered copes, mitres, and croziers, also by the latter painter; and the "Celebration of High Mass," by Jan van Eyck (173), a highly-finished example of an interior, with rich carving of reredos and details, are also lent by the Earl of Dudley. Other examples are ascribed to Fra Angelico, Da Vinci, Signorelli (163), Mantegna (176), Giotto (178) (180), Perugino. Many of these old paintings are choice specimens of the earlier schools of religious art of the 13th, 14th, and 15th centuries.

In the water-colour gallery a series of very beautiful drawings are hung, representing Turner, chiefly sketches and studies from the earlier monochromes like Fonthill, dated 1800, to those charming visions of colour which we met in his Rhine sketches and vignettes, as in his "Sion" (52), and his Venetian sketches (53), "The Rialto" (54), "Grand Canal" (66). John Sell Cotman's series, including his "Trentham Church" (47), "Byland Abbey" (45), "House of St, Ouen, Rouen" (102), his fine drawing of tracery in south transept of Norwich (100), the composition of classical landscape (103), are highly characteristic and beautiful drawings, many of them in simple washes. A few free and masterly sketches by De Wint, of landscape, are conspicuous examples of breadth, such as his "Bolton Abbey" (82). David Cox is represented in four vigorously-handled landscapes on sugar paper; but the series of fourteen drawings by William Hunt will be much appreciated by an even larger number of picture admirers. We can only here refer to his study, "Meekness," a little girl steated on a bank with pitcher; his studies of boy-life, "Contented with Little" (87), a rosy, chubby little fellow sitting on a tub, eating a dumpling on a fork, or "Happy with More" (96). His still-life subjects are exquisite in finish and colour, as the groups of grapes and pears (88), bird's-nest (89), apples and berries (93), melons and grapes (97). In all, the same rich, splendid colour, texture, and homely, natural treatment devoid of all idealisation, are evident, which qualities endeared his work to Ruskin, who speaks of his grapes as the "vintage of Rubens."

THE CAMERA CLUB.

MR. J. PATTISON GIBSON has on view at the Camera Club a small collection of very superior landscape photographs, forming the eighth of the series of "One Man Photographic Exhibitions" held in connection with this society. The pictures are for the most part full-plate prints; but there are a few larger ones, such as the beautiful camera-scene called "Twilight," representing a river wending its rocky way through a well-wooded valley, and in the middle of the foreground a young girl is seated on a big, water-washed stone, contemplating the stream in the haze of the evening time, which is splendidly realised in the photograph, and showing, too, the relative values of the foliage in the distance, middle picture, and foreground. "The Thaw," a seasonable snow scene, "Loitering Lovers," and "The Road to the Mill" are capital prints. The view of a Northumbrian cottage, with its thatch-covered stone walls, arrested our attention. The living part is on the first floor, approached by an external stone staircase, the lower part of the building being used as a store. Lanercost Priory Church in ruins; Linold's Mill and Bamborough Castle, standing like Mont St. Michael on a promontory overlooking the sea, were the only other subjects of special interest to the architect.

PARTY AND PARTY-FENCE WALLS.

THE discussion on a paper under the above title, read at the Surveyors' Institution last month and reported in our columns, was resumed on Monday evening last, the President, Mr. R. C. Driver, being in the chair.

Mr. T. M. Rickman (Fellow) said that the difficulties which occurred on party-wall questions in the country arose from the absence of any Building Act in rural districts, while those which arose in London were in a great measure due, he thought, to the presence of such an Act. The common law rights in the separate sides of a party-wall were very confused and ill defined; but under the Building Act it was generally assumed that there was a joint ownership, and, moreover, party-walls in London were generally built as a whole and bonded together, while in the country it was a not very uncommon practice—although an extremely dangerous one—to build two separate and distinct half-brick walls close together to form the party-wall. When the earlier Building Acts of London, arising out of the Great Fire, were in force, the houses, although differing externally, were structurally very similar, and might easily be divided into three classes, each requiring walls of a certain thickness and strength. But now that styles were so varied and occupiers' needs so diverse, it was impossible to predict beforehand exactly what would be required for a building on any given site, and he thought than any amended Act should possess so much elasticity as would enable it to meet the requirements of the times, and not by its rigid enactments to become soon old-fashioned and unsuitable. A party-wall was the one part of a building which remained longer in existence than any other. The front and back walls might be altered many times for architectural effect, or for other reasons, but the party-walls outlived many such alterations. In the same way, the chancel arch of many old churches (which was essentially a party-wall) remained through many alterations and rebuildings of the nave on the one side, and the chancel on the other. This fact of the duration of such walls rendered it, he thought, the move imperative that their strength and structure should be carefully provided for and supervised. He thought it a shocking thing that in many modern houses the flues of the adjoining houses were arranged as to come within 4½in. of either side. A very fruitful source of fires in commonly-constructed houses was the running of stair-strings and plugs close to, or into, the flues of the neighbouring house, and the suggestion made by the committee of the R.I.B.A. appointed to consider the revision of Building Acts was that in no case should a flue, or recess, go nearer than 9in. to the face of the other side of the wall, or else that no flue should be made within less than 2¼in. of the centre of the party-wall, *i.e.*, the absolute centre, so that between all flues would be 4½in. of brickwork in the middle of the wall. He also thought that any revision of the Building Act with reference to party-walls should also deal with party-fence walls, which now seemed exempted from the provisions of the Act.

Mr. G. M. Freeman (Associate) said that the difficulties connected with party-wall cases were not so much questions of law as of facts, and under two sets of circumstances in particular this question was an important one. In the case of a large sale of buildings, perhaps forming several holdings, the property was often much intermixed, and as one purchaser might determine to pull down, and another to let stand, his purchased building, questions of party boundaries of the most complex description arose. It was certainly most desirable, and saved a vast amount of future trouble and expense, if to all deeds of conveyance a plan distinctly defining the boundaries was appended. When, as in the case quoted by Mr. Bedell, there was a wall which, so far as the ground story was concerned, separated a house from a public passage, and above that level formed the party-wall between the house and rooms of an adjacent house built over the passage, there arose a very difficult question of law. Whether the lower portion of the wall could be treated as an independent face wall in spite of the fact that the undoubted party-wall above depended on it for support, was just one of those questions which he hoped would, in any revision of the Building Acts, be met and set at rest. Then, again, when a three months' notice had been served by the building owner or the adjoining owner, was the former entitled to commence operations (strictly on his own side, and not interfering with the adjoining owner's enjoyment of the wall) at once, or must he wait until the expiration of the three months before he could even touch the party-wall?

Mr. J. D. Mathews said that, under the old Building Acts, which followed, and were the result of, the Great Fire of London, it was the custom to appoint two workmen—and subsequently five workmen—to decide whether a wall was, or was not, a dangerous one, and old records showed that this method was frequently adopted. But he could not help thinking that the present system of three surveyors was as simple and satisfactory, especially if the third surveyor was an architect as well, acquainted with construction as well as the legal rights of the case. He did not agree that any work should be done to one side of a wall before the expiration of the three months' notice, and he certainly thought that district surveyors should set their faces against the practice of condemning a wall where there were difficulties in giving notice. The wall should always, he thought, be treated as a whole, and not as if one half belonged to each owner.

Mr. T. M. Wheeler, Q.C., congratulated the author on his paper, and the Institution on the fact that its younger members were ready and able to come forward with such sound and practical papers on subjects of interest.

Mr. W. Allport considered that some limit should be fixed within which the building owner should commence operations after giving the three months' notice. He could find nothing of the sort in the Act, and it was quite conceivable that great hardship might be inflicted on the adjoining owner by his being kept in doubt as to what, if anything, was to be done. Then again, what was a "surveyor" under the Act? He knew of a case in which a builder's foreman had been appointed to act as surveyor for one of the parties, and another in which the building owner, being himself an architect and surveyor, had actually appointed himself. These cases were, he thought, not isolated ones, and he considered it most important that there should be some definite decision as to what was meant by a "surveyor" under the Act.

Mr. A. King said that although the building owner might sometimes be inconvenienced by not being able to commence work until the expiration of the party-wall notice, it was most essential that some such notice should protect the interests of the adjoining owner. An important point which was perhaps not so generally known as it ought to be, was contained in the decision on the case of "Fillingham v. Wood," in which Mr. Justice Chitty held that for the purposes of a party-wall notice, the adjoining owner was anyone who occupied any part of the adjoining premises on a longer term than from year to year, and that each must be served with a notice, and further said that when there are such tenants in a house, and the building owner is not in a position to find out who they are, a section of the Act provides that the usual notice is good if affixed prominently to the premises, and not directed to anybody. It was also contrary to the Act that the party-wall notice should be signed by the name of a firm—that of an individual being necessary. He thought that great hardship sometimes, as in a case he cited, arose from the ability of an adjoining owner, having but very little valuable interest in the wall, to impede the progress of important works.

Mr. Bedells having replied to the remarks on his paper, the meeting then adjourned.

CHIPS.

The partnership heretofore subsisting between Messrs. Calvert and Wright, of Nottingham, architects and surveyors, has been dissolved.

Miss Amelia B. Edwards, the well-known Egyptologist and novelist, has been accorded a pension on the Civil List. For the last twelve years Miss Edwards has devoted herself almost exclusively to archæological, and especially to Egyptian, subjects. The foundation, in 1883, of the Egypt Exploration Fund, was largely due to her efforts, and she has been for some years its honorary secretary. Egyptology was the subject of a very numerous course of lectures delivered by her in the winter of 1889-90 in the United States—a country in which, at the centenary celebration of Columbia College, she had already received an honorary degree.

Mr. Walter Emden, M.S.A., has been selected as the candidate of the Strand Conservative Association for the London County Council, in succession to Sir Augustus Harris, who does not seek re-election.

Mr. R. Fitch, of Norwich, has presented the whole of his local collection, including many seals, signet rings, and manuscripts, to the Norwich Museum, and has also offered to bear the cost of fitting up a room for the reception of the exhibits in the restored shell of Norwich Castle.

The work of constructing the Castle Hill Railway at Bridgnorth, one of Mr. Newnes's enterprises, is proceeding rapidly, the great cutting being now almost completed by Mr. Law, the contractor. The gradient is about one in one and a half. The buildings for the top and bottom stations, waiting-rooms, and depots are now being erected by Messrs. Bradney and Co., of Wolverhampton. Mr. G. Croydon Marks, of Birmingham, the engineer of the undertaking, expects to have the line completed and open for traffic shortly after Easter next.

On Saturday afternoon the new premises of the Broomhill Co-operative Society at Newcastle-on-Tyne were opened by Mr. Albert Grey. The building, which has cost about £2,600, has been designed by Messrs. Oliver and Leeson, architects, Newcastle, the contractor being Mr. D. M. Spence, of Amble. On the ground floor there are large fitted shops, and on the first floor there is a hall for public meetings, committee rooms, secretary's office, &c.

In the years 1874-5 St. John's Church, Coventry, was in the restorers' hands, the architect being the late Sir Gilbert Scott, and the builder Mr. T. Collins, of Tewkesbury. Recently it was discovered that two beams at the west end of the church, from which the font cover is suspended, were affected with dry rot. A meeting was called at the vestry on Saturday to consider the matter. The rector stated that both Mr. Collins and his foreman on the restoration had visited the church, and various reasons for the defect were suggested by them, the absence of proper ventilation being regarded as the most likely cause. In the end the wardens were requested to have a thorough examination made of the roof, and report to a future meeting.

ILLUSTRATIONS.

THE FIRST PREMIATED DESIGN FOR THE NEW MUNICIPAL BUILDINGS AT BATH.—ANIMALS FROM CARDIFF CASTLE.—THE BERMONDSEY SETTLEMENT.—SCREEN AT TEWKESBURY ABBEY.—THE DAIBUTSU AT KAMA-KURA, JAPAN.—"CROOKSBURY," FARNHAM.—DINING ROOM AT FARNMAM ROYAL.—ADDITIONS TO WESLEYAN SCHOOL, NEW WORTLEY.

Our Illustrations.

SELECTED DESIGN FOR BATH MUNICIPAL BUILDINGS.

THIS double-page plate represents the design chosen for execution in this recent competition, all the plans for which we described in our review a few weeks ago, when we illustrated one of the other premiated designs. Our illustration is from photographs taken in the exhibition room at Bath by special permission of the municipal authorities. Mr. J. M. Brydon, F.R.I.B.A., is the architect of the works.

ANIMALS FROM THE OUTER WALL, CARDIFF CASTLE: THE LATE WM. BURGES, A.R.A., ARCHITECT.

LAST week we gave a double-page plate illustrative of these sculptures by Mr. T. Nicholls. We now give three other photographs of some more or different views of the same groups. The descriptive note printed with the previous illustrations leaves nothing to be added here, as the beauty of the work speaks for itself.

THE BERMONDSEY SETTLEMENT.

THE Bermondsey Settlement, opened on Wednesday last by Sir John Lubbock, M.P., is planned to accommodate 20 residents and a warden, whose house is for the present omitted for want of funds. Each resident has a sitting and bed-room, the drawing-room, dining-hall, and library being used in common. The University men and others in residence will carry on the work of the settlement in the lecture-hall and class-rooms, which are approached independently of the residential portion of the buildings. In the basement is a well-appointed gymnasium, a workshop and a chemical laboratory being also provided. Situated in Farncombe-street, the site affords space for a tennis court in front and for a garden in the rear. The works, which are approaching completion, have been carried out by the Cooperative Builders, Limited, of Burton-road, Brixton, from the designs of Mr. E. Hoole, F.R.I.B.A., the architect of Toynbee Hall, to which in their purpose these buildings bear considerable resemblance.

NEW CHOIR SCREEN, TEWKESBURY ABBEY.

IT has long been felt that the interior of the abbey could not have the effect its original builders intended until a high screen was erected. This is now about to be done through the liberality of the Vicar Canon Robeson. The screen, which is to some extent founded on the external one now the northern enclosure of the choir, has been designed by Mr. J. Oldrid Scott, F.S.A., and is being executed by Mr. Collins, who has done so much in connection with the abbey. The work is approaching completion, and will be erected before next Easter. The cost will be about 700.

DAIBUTSU (GREAT BUDDHA) AT KAMA-KURA.

THIS famous bronze image of Buddha stands near the village of Hasemura, once a suburb of the ancient capital of Kama-Kura, and celebrated for its connection with Yaritomo, one of Japan's most famous heroes and first Shogun (circa A.D., 1185). Daibutsu was cast in the early part of the XIIIth century under the orders of Yaritomo, and was formerly under the roof of the temple of Shojo Senji; but the latter was destroyed by a tidal wave in 1404. The following are some of the dimensions of the image; Height, 50ft.; length of face, 8ft. 6in.; length of ear, 6ft. 6in.; width of nostrils, 2ft. 3in.; width of mouth, 3ft. 3in.; weight, about 450 tons. According to the Japanese, the image is composed of copper, tin, and gold. This latter quality attracted the notice of an American syndicate some years back, and an offer was made to purchase the image; but to the credit of the Japanese *bonzes* (or was it that the price offered was insufficient?) the proposal was rejected. The image is of a bluish bronze colour, is hollow, and is decorated inside after the manner of Japanese temples. Viewed from where the photograph was taken, the image has a most fascinating effect upon one, the head bent forward as if in silent thought gives to this extraordinary figure an appearance of divine majesty, probably unequalled by any other images of gods.—PAUL BEVAN.

"CROOKSBURY," NEAR FARNHAM, SURREY.

THIS house was built last year on the south side of Crooksbury Hill for Mr. A. W. Chapman. The materials used are red brick and tile-hanging; the timberwork is bricknogged. For the tile-hanging and roofs, old tiles have been used from off old buildings, unfortunately destroyed, in the neighbourhood. The forecourt is paved with ironstone, which is found on the site. A "tea-house" finishes the N.W. angle of this court, from which there is a magnificent view across Waverley. The illustration is taken from where this tea-house is. On the south side are terraced gardens, with brick retaining walls 13ft. high. The principal rooms have all a sunny aspect, and the house is well lighted throughout. The bedroom doors have oak latches with leather bobbins, as are seen in the old farmhouses in the neighbourhood. Mr. Edwin L. Lutyens, 16, Onslow-square, S.W., was the architect, and Messrs. Mitchell Bros, of Shalford, Surrey, were the contractors. The stables are built near the house, so as to compose with the house buildings generally.

THE DINING-ROOM, FARNHAM ROYAL.

AMONGST the various works which the late W. Eden Nesfield carried out at Farnham-Royal for Mr. H. Vallance, the subject of the accompanying illustration, viz., the Ingle-Nook in the Dining-Room, was one of the most successful; and apart from its undoubted merits as a composition, it derives additional interest as being an early attempt to break away from the formal and inartistic decoration of the Early Victorian period. Perhaps no one feature of Mr. Nesfield's work found at the time more imitators than this particular chimney piece. A low beam, elaborately moulded, stretches across the nook, which by a few simple arragements is made, as it ought to be, the centre of attraction in the apartment. Two substantial settles flanking the fireplace on either side, which can be cushioned as taste directs; plenty of shelving for the display of nick-nacks, a simple mantelpiece appropriately carved, a small window for a view, and a dog-grate, are the component parts within the recess; while over the opening outside, the main wall of the room is quaintly panelled and fitted with a long shelf on brackets, forming what is practically the over-mantel. This work was carried out by Mr. Jas. Forsyth, of Finchley New-road, N. We gave an illustration of the sideboard in the BUILDING NEWS for Oct. 16th last.

WESLEYAN SUNDAY SCHOOLS, NEW WORTLEY.

ADDITIONS to the above schools have been recently made, affording increased classroom accommodation and greater facilities for ingress and egress. The architect is Mr. T. Butler Wilson, of Leeds and Harrogate.

◆

Under the will of Mr. Richard Cooper, of Tulse Hill, Parliamentary agent, five pictures (by Cornelius Breze, Bout, and Beodwyns, Rykaert, Moucheron and Lingelbach, and the Venetian School) are to be offered to the trustees of the National Gallery, on condition that the inscription, "R. W. Cooper, Tulse Hill," is placed upon them, and that the picture by Moucheron and Lingelbach is hung in a strong light.

COMPETITIONS.

FARNWORTH, MANCHESTER.—In the competition for public baths for Farnworth, to be erected near the Market-place, the local board have selected the designs by Messrs. Booth and Chadwick, of Manchester.

HORSHAM.—The governors of the Horsham Grammar School being about to erect new school buildings and residences, eight architects of repute were nominated, from whom they have selected Mr. Arthur Vernon, of 26, Great George-street, Westminster, and High Wycombe, as their architect, to carry out the new buildings, which are to be commenced in the spring.

◆

CHIPS.

The new cottage hospital, Market Drayton, is being warmed and ventilated by means of Shorland's patent Manchester stoves, exhaust roof ventilators, and vertical inlet tubes, the same being supplied by Mr. E. H. Shorland, of Manchester.

A stained-glass window has just been placed in St. James's Congregational Church, Newcastle-on-Tyne, by Mrs. Scott, in memory of her late husband. The work has been executed by Messrs. Heaton, Butler, Bayne, and Co., of London. The subject, which is carried over three lights, divided by broad mullions, represents the incident in the Gospels of the meeting of Our Lord and Nathanael.

To meet the growing requirements of Amble, a field of eight acres has been acquired by Messrs. R. Carse and Son, builders, and a plan was laid before the Local Board last week for converting this land into building sites. The survey has been made and the streets have been planned by Mr. George Reavell, jun., architect and surveyor, Alnwick.

The northern section of the Liverpool Overhead Railway is now practically complete. Electricity will be employed as a motive power. The engineers to the railway are Sir Douglas Fox and Mr. J. H. Greathead. Messrs. Frank Fox and S. B. Cottrell represent the engineers on the work. Mr. J. W. Willans is the contractor, and Mr. Ferdinand Huddlestone is the contractor's engineer.

A Presbyterian church is about to be built on Fair Isle, midway between Orkney and Shetland Isles. It will be seated for 200 worshippers, and will have a porch, belfry, and vestry. Messrs. Sinclair and Hardie are the architects, and the cost is estimated at £600. The Lerwick Presbytery gave their sanction to the scheme at their last meeting.

The Hull public rooms, containing one of the largest halls and most extensive suite of rooms in the town, have been totally destroyed by fire, which originated in a cellar in which the heating apparatus is fixed. Heat was merely being kept up to prevent the pipes from freezing. The roof of the main building fell in, and a large balcony, capable of holding 600 persons, was destroyed. The side rooms were saved.

At the annual meeting of the council of the Liverpool Society of Painters in Water-Colours, recently held, the following officers were re-elected:—President, Hampson Jones; treasurer, R. Talbot Kelly. The treasurer's statement and secretary's report showed that the change from a close to an open exhibition had been beneficial, both from an artistic and business point of view.

A stained-glass window has just been placed in Penshurst Church, Kent. The subject illustrated is the miraculous draught of fishes, the group being carried through the three openings of which the window consists. The window is the design and work of Messrs. Joseph Bell and Sons, College-green, Bristol.

By the generosity of anonymous donors, the funds required for the widening of the new bridge at Dumfries have now been provided. This improvement of the bridge has long been felt necessary; but the town council has lacked the financial means for making the alteration. The only condition imposed by the donors is the limitation of the sum to be expended to £4,000; but it is believed that this will be ample. Plans for the alterations have been prepared by Mr. Barbour, of Dumfries, and after these have received the approval of Sir William Arrol, the work will be commenced forthwith.

Messrs. Grindley and Co., of Tunstall, exporters of white and decorated granite and semi-porcelain to the United States and Colonial markets, have left the Newfield Pottery, and commenced operations at a new manufactory in Woodland-street. The architect for the buildings has been Mr. A. R. Wood, and the contractor Mr. C. Cope, both of Tunstall, while the interior fittings have been carried out by the workmen of the firm, under the superintendence of Mr. E. Woollams, the manager. The works are capable of turning out from 145 to 150 crates of ware per week, and will find employment for about 600 hands.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations*, and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances*, under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance*, as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names. We cannot keep the list open long, so those desirous of being included should *send in their instructions at once*, as when the allotted space is full no more names will be received this year.

ARCHITECTURAL DESIGNERS—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

ARCHITECTURAL PHOTOGRAPHERS—
Bedford, Lemere, and Co., 147, Strand, London, W.C.

ARCHITECTURAL TERRACOTTA—
Gibbs and Canning, Ltd., Tamworth.

ARTISTS IN STAINED GLASS—
Bourne Swaine, 61, King Edward-road, Birmingham.

ASPHALTE—
Avelines Sicilian Asphalte. Joseph Bernays, 96, Newgate-street, E.C.

BATH STONE—
Bath Stone Firms, Limited, Bath.

BLINDS—
Williams, G. A., and Son, Queen's-road, Bayswater.

BOOKS—
B. T. Batsford (Professional), 52, High Holborn, London, W.C.

BRICKS—
Accrington Brick and Tile Co. (Facing Bricks, Plastic and Semi-Plastic), 8, St. James-street, Accrington.
Gibbs and Canning, Ltd. (White Glazed), Tamworth.
Heather Brick and Terracotta Co, near Ashby-de-la-Zouch.

BRICK AND TILE MACHINERY—
Clayton Howlett Co., Woodfield-road, Harrow-road, W.

BUILDING & QUANTITY SURVEYORS—
Flew, J., 11, Popplewell Chambers, Bradford.

BUILDING COMPOSITION—
White, W., Great Western Works, Abergavenny.

CASEMENTS AND WINDOWS—
Wragge, Geo. (Wrought Iron, Steel, and Gunmetal), Wardry Works, Chapel-street, Salford.

CEMENT MANUFACTURERS—
Rugby Portland Cement Co., Rugby.

CEILING DECORATIONS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

CONCRETE—
Fambrini and Daniels, Excelsior Art Concrete Works, Lincoln.

CURTAIN BLINDS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

DECORATORS—
Campbell, Smith, and Co., 75 and 78, Newman-street, London, W.
Lamb, J. (Specialist), 14, Marlbro'-road, Turnham Green.

DEVONSHIRE MARBLE—
Goad, J. and E., Phœnix Steam Marble Works, Plymouth. (See Brompton Oratory.)

ELECTRIC BELLS—
Gray, J. W., and Son, 113, Gracechurch-street, E.C.
Teale and Somers, Electricians, Leeds.

FANLIGHT OPENERS—
Osborn, David, High-street, Berkhamsted.

FIBROUS PLASTER—
Plastic Decoration and Papier Mache Co., ltd, 21, Wellington-street, Strand, London, W.C.

FIREPLACE—
Teale Fireplace Co. (Teale and Somers), Leeds.

FIREPROOF FLOORS—
Lindsay Neal, W. H., and Co., 15, North Wharf, Paddington.
Phœnix Fireproof Flooring Co., 9, Oxford-street, Manchester.

FIREWOOD SPLITTING & BUNDLING MACHINERY—
Glover, M., and Co., Patentees and Saw Mill Engineers, Leeds.

FURNITURE—
Foster and Cooper, 63, Long-row West, Nottingham.

GRANITE MERCHANTS—
Webb, Percy C., 41, Eastcheap, London, E.C.

HEATING APPARATUS—
Boyd, Jas., and Sons, Paisley.
Grundy, J, 30, Duncan-terrace, City-road, London, N.
Teale Fireplace Co. (Teale and Somers), Leeds.

HORTICULTURAL BUILDINGS—
Boyd, Jas., and Sons, Paisley.
Gloucester Railway and Carriage and Wagon Co., Gloucester.

HYDRAULIC RAMS—
Blake, John, Oxford-street Works, Accrington, Lancashire.

INTERIOR WOODWORK—
Foster and Cooper, 63, Long-row, Nottingham.

IRON AND STEEL GIRDERS—
Walmsley, B., Court Chambers, Mawdsley-street, Bolton.

JOINERY—
Elliott, Saml., Albert Joinery Mills, Newbury.
Gloucester Railway and Carriage and Wagon Co., Gloucester.

JOINER'S OILSTONES—
Whittle Hill Hone Co., Charley Forest, near Loughboro'.

LIGHTNING CONDUCTORS—
Gray, J. W., and Son, 113, Gracechurch-street, E.C.
Morris and Gold, Wardrobe Chambers, Queen Victoria-street, E C.
Teale and Somers, Leeds.

LIFTS AND CRANES—
Waygood, R, and Co., Falmouth-road, Gt. Dover-street, S.E.

LIME BURNERS—
Rugby Portland Cement Co., Rugby.

LOCKS—
Colledge and Bridgen, Wolverhampton.

MARBLE WORKERS—
Emley and Sons, ltd., Marble Works, Newcastle-on-Tyne.

PAPERHANGINGS—
Land, J. and H., 93, Cannon-street, E.C.

PASSENGER LIFTS—
Waygood, R., and Co., Falmouth-road, Gt. Dover-street, S.E.

PAVEMENT ROLLERS—
Gilchrist, Alex., 25, Eglinton-street, Glasgow.

PERSPECTIVES—
Finsbury Tracing and Drawing Office, 113, Pavement, E C.

PHOTO-LITHOGRAPHY—
Whiteman and Bass, 236, High Holborn, W.C.

PIPES—
Gibbs and Canning, Ltd. (Glazed Stoneware), Tamworth.

QUANTITY LITHOGRAPHERS—
Pettitt, T., and Co., 22 and 23, Frith-street, and 50, Old Compton-street, London, W.

RAIN WATER SEPARATORS—
Roberts, C. G., Haslemere, Surrey.

SANITARY APPLIANCES—
Gibbs and Canning, Ltd., Tamworth.

SINKS—
Gibbs and Canning, Ltd. (Cane-colour Glazed), Tamworth.

SPEAKING TUBES—
Gray, J. W., and Son, 113, Gracechurch-street, E.C.

SPECIAL ENGINEERING BRICKS—
Accrington Brick and Tile Co, 8, St. James-street, Accrington.

STAINED-GLASS—
Adam, Stephen, and Co. (formerly Adam and Small), Glasgow.
Camm, T. W, High-street, Smethwick, Birmingham.
Worrall, W, and Co., 75, Endell-street, London, W.C.

STEEPLE JACKS—
Morris and Gold, Wardrobe Chambers, Queen Victoria-street, E.C.

STONE—
Fielding, J. (Alton Stone, Red, White, and Mottled), Alton, Staffordshire.

STONE WORKING MACHINERY—
Powis Bale, M., and Co., Appold-street, London, E.C.

STOVES—
Teale Fireplace Co. (Teale and Somers), Leeds.

TELEPHONES—
Gray, J. W., and Son, 113, Gracechurch-street, E.C.
Teale and Somers, Leeds.

TERRA-COTTA—
Accrington Brick and Tile Co. (and Ornamental Brickwork). 8, St. James-street, Accrington.
Pulham, J., and Son, 50, Finsbury-square, and Broxbourne, Herts.
Thompson, Jabez, Northwich, Cheshire.

TILES—
Carter and Co. (Encaustic, Mosaic, and Faience), Poole, Dorset.

TRACINGS—
Finsbury Drawing and Photo-Copying Office, 113, Pavement, E.C.
Marshfield and Co. (Photo-copied), 5, Little Queen-street, Westminster, S.W.

VENTILATION—
Acme Ventilating and Heating Co., Liverpool and London.
Buchan, W. P., R.P., S.E, 21, Renfrew-street, Glasgow.
Gibbs, John, and Son, 27, South John-street, Liverpool.
Howorth, Jas, and Co., Victoria Works, Farnworth, Bolton.
Teale Fireplace Co. (Teale and Somers), Leeds.

WATER CLOSETS—
Bostel and Son, 73, Ebury-street, S.W.

WOOD BLOCK FLOORING—
Gregory, T., and Co., Station Works, Clapham Junction, S.W
Lowe, Roger L., Worsley-road, Farnworth, Bolton.

WOOD CHIMNEY PIECES—
Foster and Cooper, 63, Long-row, Nottingham.

WOOD-WORKING MACHINERY—
Butler, Sydney, Park Works, Langley-lane, Vauxhall, S.W
Reynolds, F. W., and Co., Acorn Works, Edward-street Blackfriars-road, S.E.

WROUGHT IRON GATES, GRILLES, &c.—
Teale and Somers, Leeds.
Worrall (Specialist), Byrom-street, Liverpool.

ZINC WORKERS—
Thomerson, Chas., 263 and 265, Hackney-road, N.E.

WAYSIDE NOTES.

THE new laws relating to public health, that come into force with the beginning of the year, are certainly appearing upon the scene at an opportune moment. The last Registrar-General's report shows great mortality in London, and an unusually high metropolitan death-rate. Legislation will not do much for us in the way of hindering the ravages of natural death-causers, such as inclement weather, &c., but every effort at hygienic law-giving should do a little to lessen the number of cases of fevers and ailments referable to dirt and ignorance. We shall not benefit greatly from the fact that now it will be against the law for a dustman to receive from the householder the price of half-a-pint of ale; but some of the clauses in the new health by-laws should prove of practical advantage to the community. Under the up-to-date arrangements it will be easier for the "authorities" to "get at" the citizens who will not, without compulsion, put their houses in order. This should be a great thing, for the reason that in sanitary matters it is of importance to be able to deal with the individual. General instructions and commands, even if observed by the ninety-nine, are negatived in point of practical benefit, by the apathy or neglect of the one black sheep.

The most appropriate watchword of the sanitary reformer and hygeist would be "Prevention is better than cure." Wholly in harmony with this, then, is the contemporary conference at Venice — the *real* Venice — whereat is being argued and debated the various aspects of quarantine and the prevention of the importation of Eastern diseases to the Western world by way of the Suez Canal. It is perhaps fortunate that we are now, thanks to a half-century of growing reform—in the way of emptying of dustbins, trapping and ventilating drains, and the application of soap-and-water to the masses—in no such fear of a cholera epidemic as in years gone by. Still, it is always well to be on the safe side, and an effectual barrier of quarantine between these shores and the filth of the East would be a comfort in evil days. Of other countries one might speak differently. It is not unreasonable to express a belief that the Continent of Europe, as a whole, should look to the beam before it troubles about the mote. No amount of quarantine would ultimately prevent a disease finding its way and fastening upon places where every law of sanitary science is ignored. Let our Continental neighbours put their own houses in order, and remove the filth which is on their thresholds. Time, then, to consider the shortcomings of the stranger that is without the gate.

I see that Canon Benham recently granted the use of the vestry of St. Edmund King and Martyr, his church in Lombard-street, for the consideration of sanitary matters and *the appointment of a minister of health.* There is no doubt that an official of this nature would prove serviceable to the public. The age is ripe for such an appointment to be made. The Local Government Board is a wonderfully hard-working, useful institution; but it has so much to occupy it that it is becoming a question whether a separate "Minister of Health" with, say, a "National Department of Hygiene," could not be created with benefit. Duties could then be more concentrated in their several ways. The idea—no novel one, however—seems to deserve leisurely and serious consideration.

We have our Venice in London, and are rapidly acquiring a veritable Pompeii in England. The excavations at Silchester are, according to a long and interesting account in Saturday's *Times*, unfolding a plan of an extensive Roman city, with its baths, villas, *insulæ*, &c., as at Pompeii, the whole on a scale of completeness that, I believe, is unrivalled so far as concerns our own country. It does not follow that at Silchester are the most extensive remains of this description in England; but owing to difficulties of one kind and another that prevent the archæologist from following up traces of Roman occupation—now an unsympathetic landowner, and their inconvenient proximity to modern buildings, and at all times more or less (the former generally) want of funds—owing to difficulties of this kind, clues to further remains have not been so systematically and persistently followed up as at Silchester. All the more value, therefore, is to be placed on the things thereat accomplished. It seems that excavations are to be continued during the year, and that even as at present left, the site of the old city is worth a visit. By the time the whole place has been laid bare, it will evidently be worth a long and special journey, even for an ordinary antiquarian sightseer. Little more than a ground plan of the city appears to be left after the work of excavation, any masonry, &c., above the old ground level being fragmentary only; but no lack of interest will be felt from this circumstance. Some time ago, it will be remembered, there was an exhibition of fragments, tools, and miscellaneous articles found at Silchester, in the rooms of the Society of Antiquaries, Burlington House, and now another exhibition is on view which should be of greater interest even than the first.

Competing architects residing more than fifty miles from Penrith will have voted the game of sending in plans for the proposed new school scarcely "worth the candle." A select few, therefore, will be found to have entered this competition. Local architects take their benefit. It is not altogether an unreasonable demand—that the competitors shall have inspected the site —especially when the site is of a peculiar kind, and beset with a multitude of difficulties. Whilst boards and corporations continue to send out such miserably insufficient details of levels, &c., with the particulars of their competitions, they might just as well adopt the method of procedure of the Penrith School Board, and save a score of non-site-seeing competitors the trouble of competing in vain. The Penrith Board, however, cuts itself off from a number of outside competitors who would send good plans. This may, or may not, be their object. If the inaugurators of competitions want to get all the plans they can, and at the same time wish to avoid, as far as possible, the evils attending the non-seeing of sites, they should *prepare good plans and sections, with careful levels and concise notes* about their sites. Unless there is something very unusual or awkward about the site, such careful preparations will enable every intelligent architect to grasp the subject. Some of the particulars furnished to architects are disgracefully slovenly. A year or two ago I was shown a set of conditions prepared on "tea-paper," and periodically we get these carelessly drawn up particulars of competitions.

I was glad to see last week a letter in the *Standard* respecting the threatened encroachment on West Wickham Common, to which I recently referred. The communication was signed by Miss Octavia Hill, Mr. Samuel B. Berrington, and Mr. Robert Ritherdon, and describes the iron fence to which I alluded. The term I used was "Hayes Common," from a habit of regarding all the breezy commonlands of Hayes, Keston, and West Wickham as Hayes Common generally; but the signatories of the above-mentioned letter talk of West Wickham Common, which, I suppose, is the correct designation. Whatever may be the correct name of the place, the fact of its transcendent beauty remains, and the threatened danger still depends. Those who know the common will be glad to hear that sufficient interest has been roused to put in force the Metropolitan Commons Acts, and that the Board of Agriculture have ordered a preliminary inquiry to be held. The Bromley Footpaths and Commons Protection Society have been instrumental in advancing this matter, and need subscriptions on behalf of furthering the work, which, by all so disposed, may be sent to the Bromley Branch of the London and County Bank.

Springtime is the best to see this bit of Kentish common. There is then such breadth of effect—broad masses of light-green foliage and broad masses of ruddy brown, as contrast, in the carpet of dead beech-leaves. The steep hill, on which hang the immemorial oak-trees, turns to the setting sun, and is bathed in the warm evening glow wherever the thick canopy of leaves of beech and oak permits of the entry of the bright rays. A wealth of light-green bracken varies the rich tints of the old beech-leaves, across expanses of which the shadows of the dark, gnarled and knotted, twisted and blasted, oaks fall in cool purple tones. Above oak and beech mingle their youthful greenery, the brilliant spring foliage, heightened now and again by the dark head of some pine-tree, or eclipsed by the delicate tints of the fairy-like larch.

From the foot of this hill, a gentle ascent across a meadow path leads to West Wickham Church—well-beloved by painters, and deservedly so. Seated on a knoll, commanding views of the tree-tops of the neighbouring common and looking towards the sombre pinewoods on the Addington hills, forming one in a picture with the old red-brick mansion adjoining, ivy-clad and lichen-covered, the old building attracts us on first sight, and closer inspection raises it in our estimation, while we feel, intuitively, the attraction of the place, and have a bond of sympathy with the artist who so frequently labours to reproduce its beauty of effect.

GOTH.

CHIPS.

The Nineteenth Century Art Society have acquired the galleries adjoining the Conduit-street Galleries, and now known as the Maddox-street Galleries. These premises are now on the same level, and can be made to communicate, as they did formerly.

The Church of England cemetery-chapel at Bedford has just been filled with stained glass from the studio of Mr. H. J. Salisbury, St. Alban's, Herts. The east window, which is divided into three compartments, has representations of The Crucifixion, Resurrection, and Ascension of Our Lord. Figures of the patron saint of each church in the town have been introduced into the five side windows.

The picture of "The Blind Girl," by Sir J. Everett Millais, R.A., has been presented to Birmingham by Mr. William Kenrick, M.P., chairman of the local museum committee.

A debate took place at Nottingham Town Council on Monday on a motion for opening the Castle Museum and Art Gallery on Sundays. In support of the proposal, the experience of Birmingham and other large towns was quoted. The motion was rejected by forty-one votes to seven. Nine members remained neutral.

At a meeting of the Council of the Royal Society of Painter-Etchers, held on Friday last, the following were elected associates, viz.:—C. E. Baskett, E. W. Charlton, J. Knight, E. K. Martyn, and E. Piper.

A society is in course of formation for the encouragement of the study of Japanese art, science, and industries, of the commerce and finance, the social life, the literature, the language, history, and folk-lore of the Japanese. The society will hold periodical meetings for the reading of papers and for discussion, will create a library, and arrange temporary loan exhibitions. The first general meeting will be held towards the end of this month in the rooms of the Society of Arts.

The Preston Town Council have decided to memorialise the Local Government Board for power to borrow £32,500, the balance of £130,000, required for the purposes of the new sewage farm at Freckleton.

Good progress is being made with the harbour works at Torquay, in course of construction for the local board. The breakwater has now been carried out to a distance of 900ft. from the shore. Mr. Inglis is the acting engineer, and Messrs. Cochrane and Sons are the contractors.

The charming little New Year souvenirs sent out by Messrs. R. Boyle and Son, Limited, are admirable specimens of illuminated and coloured printing, and the handy combined pocket calendar and scale will find favour with thousands throughout the year.

The first portion of a large building estate situated at Sparkhill, a growingly important suburb of Birmingham, has now been completed. The builders were Messrs. Hughes and Son, of Sparkhill. At Edgbaston a number of villa residences of somewhat similar character to the preceding, but with much wider frontages, have also been completed. The builder was Mr. Edward Airey, of Gillott-road, Birmingham. At Llanelly, South Wales, a number of larger villas are in course of erection. The total cost will be about £9,000. The architect for these buildings is Mr. John Statham Davis, of 53, Newhall-street, Birmingham.

New science and art schools are about to be erected at High Wycombe, from the designs of Mr. Arthur Vernon, F.S.I., 26, Great George-street, Westminster.

A portrait of John Flaxman, painted in Rome in 1792 by Guy Head, an amateur artist, has been presented to the National Portrait Gallery by Mr. T. R. Williamson, of Manchester, who purchased it at the recent Crozier sale at Christie's.

NOTES FROM EDINBURGH.

THE year 1891 has been a busy one in all the building trades; wages have advanced, and the prospects of their continuing so are good. The Royal Infirmary, though supplemented in several ways by auxiliary departments since the building was erected, is inadequate to meet the ever-increasing demands for its services, and plans have been prepared for an addition to cost about £70,000. A new school has just been begun for South of Morningside suburb. The civic authorities appear to have made up their minds to erect a costly refuse destructor at Powderhall, and the Water of Leith scheme will probably have two years' work before it yet. The railways are making extensive alterations, and there will be the usual amount of private speculative building.

Much has been done within the year more or less important and interesting from an architectural point of view. Foremost among the largest edifices of the city, the Gallery of National Portraiture and Antiquarian and Historical Research is at length complete, having been formally opened during the past summer. It is the only building of its size (not ecclesiastical) designed in the best style of Decorated Gothic, and it makes an impression, also, in virtue of the very peculiar character of its design, there being probably no other of a similar character in the kingdom. The cathedral church of St. Mary has added a very richly decorated chapter-house to its equipment, modelled carefully on old examples, with its polished granite central pillar. The two western spires, now rather ungainly towers, remain to be built to complete the design, but no one as yet has come forward with any substantial offer of assistance.

The old Hall of the Castle, too, has been completed, but will not be open to the public till interior arrangements are made. The Argyle Tower is restored, and the new gateway and guard-house at the entrance have made an immense improvement in the appearance of the fortifications on the East.

Another important architectural feature added to the city is the Solicitors' Library, seen to great advantage from George IV. Bridge. The hall is ready to receive its library, and makes a very cheerful, well-lighted interior. Decoration for the windows has been provided by numerous medallion portraits of eminent lawyers in centre of the stained glass, executed by Messrs. Jas. Ballantine and Sons.

The Social Union is an organisation of voluntary effort which endeavours to improve the habits of the poorer classes by bringing home to their experience the practical advantages of artistic design, and a clean and comfortable environment. They have been persevering steadily in their line of welldoing for some years, and have recently completed the work of restoring the White Horse Inn, close and court, by fitting up the old and ruinous hostelry at the north end as a tenement with several good houses of one and two rooms a-piece. Externally the uilding is probably much as it was in the olden me: all that was characteristic in its appearance retained, and the roof is covered with Stafford re red tiles. The rough-cast is prettily tinted, woodwork in doors and barge-boards painted n, and the whole looks, very likely, better it ever did in its palmier days.

school building, one large school for the of the Sciennes is now nearly finished. It more fortunate in its site than any of ready built, as it stands far from any of owded thoroughfares, with extensive and frontages to the south, and good air and t on the other sides. The large playground in front, with concrete surface. The classooms are in two floors, arranged *en suite* north and south of a central space, which is occupied by the great staircase and accommodation for hats and cloaks and lavatories. On the south side the classrooms are three, the centre one having considerable projection over those at the side, and the same arrangement is carried out on the north side, only with two instead of a single room on either side of the large central classroom. The rooms are separated by sliding partitions, and are about 18ft. high, this height allowing for two floors for cloaks, &c. The staircase is well lighted, but the space for the conveniences mentioned is dark—a condition which will not be improved when the frames receive their garniture of hats and cloaks.

Over the central portion, attic drawing-class rooms in the roof are provided, with a smaller room behind for instructions in elementary chemistry or other subjects. The ground level to the north being very much lower, advantage is taken to provide a swimming-bath under the central part, so that this is one of the most completely equipped schools as yet erected. The cost of erection, of course, does not diminish, and may be from £12 to £14 per scholar.

There is no great expenditure on purely decorative detail in this building, and what it has might have been spared. It may safely be affirmed of this and some other recent city architecture, that the idea of going back to the 18th century for decorative detail has not produced anything very good, and nothing so good as work with the ordinary Classical or Scotch Baronial detail. Here the whole frontage is "decorated" with thin pilaster strips from ground lines to skew, stopped under gables with heavy cornice moulding, each pilaster having the inevitable bed-post finial atop, some with and some without a podium. But the whole elevation is excellent in itself, and with its lofty ceilings and range of tall windows needs no vertical emphasis by such surface ribbons. The finials are too many, where one might have sufficed for each gable, and only suggest obstruction to the proper function of the skew cope. All this surface decoration may be defined as architectural nonsense, since no rational account can be given of the meaning of these somewhat commonplace and popular details.

The classrooms, which are all graded, are heated from open fireplaces, in some cases supplemented by hot-water coils. The large central space is heated by pipes from three large boilers in the basement. The fresh air is admitted to the rooms by the usual inlets, formed in outside walls, and the foul air—led from openings near the ceiling by shafts to a chamber in the roof—is drawn off by a fan 4ft. in diameter, driven by an Otto gas-engine.

The Episcopalian Church of St. Paul's, in York-place, has now been provided with a suitable chancel, the mason-work being completed. This church was built when there were no choral services outside cathedral churches, and when preaching in a surplice was unknown. The sacrarium was provided in the easternmost bay of the nave, and organ and choir were placed in a west-end gallery, which was continued round the sides of the interior. The nave is one of eight bays, about 110ft. long, with lofty pillars, and wide and lofty aisles, designed in Perpendicular Gothic, with timber ceiling. Externally the extremities of nave and aisles had octagonal turrets with open parapet-work rising considerably above the roofs, and giving character to the whole. The east wall of nave with the two turrets and large window have been taken down, and rebuilt about 30ft. farther east, so that the unbroken line of the nave is now of portentous length, suggesting the need of something to make up for the absence of the old turrets, which had better have been retained.

The R.C. Church of St. Mary's has had the damage done by fire repaired, and a new aisle erected. There has been a good amount of work done within the year in the way of church extension. A chapel of ease has been erected for St. Michael's parish; and three churches, all in connection with the Free Church, are nearly completed. Of these, the one most interesting architecturally is the new Free Church for South Morningside, where all the three Presbyterian bodies have now erected places of worship. They are all in line, on successive stages of the slope towards the Braid Hills, and without leaving the thoroughfare anyone can compare the respective merits of the U.P. octagon in Queen Anne style at the foot of the hill; a little further on, the Early English Gothic in the large edifice of St. Matthew's E.C.; and, lastly, the Later Decorated Gothic of the Free Church. This edifice is designed with nave about 30ft. in width, with low and narrow passage aisles, in five bays, one at the south-east being extended to form an organ transept, with choir vestry attached. A hall is provided at the east end, but separated from the church by a roomy corridor, which gives access to a vestry also. Entrance to the church is got by a door in the tower, which is built on the north west of the nave, and which has a door leading to the vestibule opening upon the passages; over this vestibule an end gallery is erected. The church is not a very large one, and will hold 600 or 650. The nave arcade is low, raised on plain octagonal piers, 2ft. 6in. diameter, with low arches, and no impost or other mouldings, the octagon splay only being carried round the arching. This impairs the aspect of the arcade, which is generally an imposing feature; but it accords much better with the proportions of the low and narrow aisles, and gives a better clerestory. The bays are very wide, about 16ft., and in each two large clerestory windows are provided, which are lintelled, and have mullioned lights, with graceful tracery in the upper part of Late Decorated character. The ceiling is a plain painted wooden vault, with larger and subordinate moulded ribs, and rather heavy cornice, carried on very plain, strong corbels.

The exterior is the most satisfactory exposition of the style, and leaves nothing to be desired. The tower is massive and stately, 25ft. square, now built to its parapet, height 80ft. or so, and preparing to receive a spire 50ft. higher. There is very little purely decorative ornament about it, unless the massive buttressing may be considered such. The parapet has no projection, but a series of moulded panels, cusped, and good cornice moulding with grotesque heads and foliage bosses alternately in its line. There is the usual octagonal staircase turret on the north-west, which rises above the parapet. Next to the tower the clerestory is the most marked feature, from the large proportions and novelty of character displayed. The church and tower have red stone dressings, happily relieved with some Hailes grey stone in the surface rubble. The red stone of St. Matthew's does not improve with time, and is a dull and dingy red, where the stone has natural fracture, and only a little better where it is polished.

The Warrenden F. Church is a plain building, almost devoid of architectural detail, and a fair example of the old-fashioned galleried interior. It will accommodate probably a third more than the church above mentioned, while the cost will be little, if any, over a third of the expenditure upon either. The church at Parsons Green is not unlike the Braid F.C., having a nave about 30ft. wide, with narrow passage aisles of similar design; transepts and a tower at the N.E. angle. It has an entrance porch and corridor stretching across the west front, giving access to the aisle passages; but no gallery at this end. The proportions and grouping of the church and hall built at the east end are good, and the whole makes a conspicuous and picturesque addition to the street in which it is erected. It is built in the red stone formerly noted, and in Early English Lancet Gothic of a very plain description. The tower, probably 80ft. in height, looks well, though not a very large one. The parapet projects upon a corbel course, and is rather heavy looking. An octagonal timber spire, covered with red tiles, with a sort of curtain formed by varying angles of the tile roof, is placed on the square tower, but sits awkwardly thereon, having no apparent connection to satisfy the eye.

The fenestration is peculiar in so far as the size of the openings are concerned, and there seems to have been a desire to produce sensational contrasts, with not very pleasing result. The transept windows are very long, so long as to make their mullions forming the three lancets look weak for their work. Close beside them, the windows are mere pigeon-holes, with lintels and corbels. The clerestory windows, comprising each a double lancet, look rather more like tops of larger windows curtailed of their proportions. The most interesting and original of the series is the large west window. This is over the corridor, and has much width, and not much height. The ordinary method is to fill in with five or seven lancets, which is always pretty; but in this case an endeavour is made to combine with this the Geometric system, and a cinqfoliated circle and other tracery are added, which may be described as resulting in a very curious medley, the chief merit of such works of art—at least, in music—being incoherency.

The interior, as a whole, is excellent in its proportions, with a vaulted boarded ceiling of low pitch, which harmonises well with the low arcade, though rather heavily timbered. The arcade is similar to that of the Braid Hill Church, but with narrower bays and more slender piers. A rather heavy drip moulding is put upon the arches, which is not out of place when there is no impost mouldings. The east and is dead wall, giving a fine space for a fresco. The interior has its transept arching carried on a very lofty octagon pillar, complete with capital and base, making a very sensational and rather invidious contrast with its humble companions in the nave arcade, which are about a third of the height. The span of the transept is very moderate, and the pillar appears to be a very unnecessary obstruction, and looks as if it would go down like a ninepin with slight lateral concussion.

The R. S. Academy opens this week. It has obtained the new charter, and, under the guidance of its new and distinguished president, Sir George Reid, it hopes to inaugurate a course more successful than it has had of late years. The government of the society is placed on a more liberal basis. So far as architecture and architects are concerned, there is little or next to nothing done in the way of change, except that architects are to be nominated, and need make no application for the honour of being made Associates ; nor are they, like other artists, required to have exhibited their work.

A new society calling itself "The Society of Scottish Artists" has been recently formed, not in any spirit of hostility to the R.S.A., but as a means of advancing the interests of art and artists in ways not open to the older body, or beyond their power by limitations of the arrangements under their control.

The mortality of Edinburgh for 1891 will not show any improvement in the death-rate over the statistics of the preceding year. Lately—since November—the weekly rate has advanced from 14 to 37, 47, and 45 per thousand, owing to influenza and similar complaints.

◆

BOOKS RECEIVED.

Notes on Building Construction. Part IV.: Calculations for Building Structures. Course for Honours. (London: Longman, Green, and Co.)—This long-delayed volume of "Notes on Building Construction" has at last been published. The aim of the writer has been to "explain fully and clearly the simplest and best methods for calculating the proper forms and dimensions to be given to timber and iron beams, cantilevers, plate, box, and trussed girders, roofs, walls, arches, water-pipes, &c." In looking over a few of the chapters, such as that on "Beams," we find that the author has well explained and illustrated the external forces acting upon a loaded beam ; the effect of the reactions of supports ; the leverage at which they act, or the "bending moment," which term is explained in smaller type for more advanced students The rule and formula to find the bending moment are clear and simply stated, the use of complicated mathematics being avoided. The examples given are particularly useful. Thus a numerical example is given of finding the bending moment of a beam 20ft. bearing, having a weight of 100lb. 6ft. from one end. The segments of beam divided by weight are 6ft. and 14ft. = 20ft. Then $R_A = \frac{14}{20} \times 100 = 70$lb. $R_B = \frac{6}{20} \times 100 = 30$lb. Thus the bending moment at point of weight (*c*) is = $CB \times R_B$ = 14ft. × 30lb. = 420ft.-lb. ; $AC \times R_A$ = 6ft. × 70lb. = 420ft.-lb. The moment of beams supported or fixed in different ways is next discussed, and the notation and illustrations are very clear, the graphic solution of each case being given by the aid of clear diagrams. The student learning the mathematical principles for the first time will find this exposition a help to him. Next the moment of resistance is discussed, first by reasoning upon the action of the fibres of a beam under a load, and next by experiment. Very clear diagrams are given to show the effects of compressing the upper fibres and of tension on the lower half of beam, and these forces are proved geometrically to shorten the length of the upper fibres and to extend those below the neutral layer. The resistance to bending is next shown by geometrical reasoning and diagrams, and the important principle is enunciated that the bending moment = moment of resistance. The expression of the value of the latter is next discussed, and this investigation is printed in small but readable type. After this the general formula, moment of resistance $= r \frac{bd^2}{6}$ is given. The question is next determined by experiment and calculation. Shearing stress and graphical representation of same for beams variously loaded are next treated, followed by diagrams showing beams of uniform strength according to the generally accepted rules. Deflection and fixed beams are also fully discussed, and numerical examples worked out. Wrought-iron rolled beams and cast-iron girders follow. These chapters are very complete, and the formulæ for practical use are given, with examples worked out. A graphic method of finding the section of a cast-iron girder is given, also the mathematical method for calculation with a worked-out example on p. 104, which will be found of value. Tension and compression bars are considered, and the author has recourse to many recent authors, including Professor Fidler on compression bars and struts. Long struts are considered, the author giving several methods ; but Professor Fidler's is preferred, and his graphical representation given. Joints and connections and plate-girders are fully treated and illustrated, and many examples given. Braced and framed structures, Maxwell's diagrams, and the method of sections used in calculating their strength are applied to structures of braced and open web kind. The chapters on roofs and iron roofs, and the stability of brickwork and masonry, including brick piers and wind-pressure on chimneys, retaining walls, &c., are important additions to a work of this kind. Following is a full and carefully written chapter on the theory and strength of arches. The exposition of the means of finding the line of resistance in an arch by a graphic method is given. Hydraulics as applied to buildings, and the practical examples worked out will be found of much value. The volume will become not only a valuable textbook to the student, but a guide to the architect as well.——*Mechanical Engineer's Pocket-Book of Tables, Formulæ, Rules, and Data.* By G. D. Kinnear Clark, M.I.C.E. (London: Crosby Lockwood and Son.)—This is handsomely bound in leather gilt edges of a handy size for the pocket, and is chiefly compiled for the use of the mechanical engineer. A large number of tables have been calculated by the author to shorten the labour of mechanical men. The 640 pages include hundreds of formulæ and rules, these being arranged under distinct heads. The strength of materials, electrical, metals of market forms for construction, as well as rules and formulæ relating to the steam engine, hydraulic engineering, and other subjects usually inserted in handbooks, are fully dealt with, and the mathematical tables are very complete.——Following in the wake of the London Architectural Association, the kindred body formed in Sydney in March last has inaugurated its establishment by the publication of a periodical for intercommunication among its members. The *S.A.A. Notes* has now reached its sixth monthly issue ; but Nos. 1 to 5 were published in one cover. The editors are Mr. S. Hurst Seager, of Bridge-street, Sydney, President of the Association, and Mr. George J. Oakeshott, who will be remembered by many of our readers as a travelling student of, and active worker in, the L.A.A. a few years since, and who is now in the Government Architect's Office at Sydney. Mr. J. P. Power, of the same city, is the secretary. The rules and class arrangements closely follow those of the London Association prior to the inauguration of the Education Scheme.——*The Municipal and Sanitary Engineer's Handbook*, by H. Percy Boulnois, M.Inst.C.E., F.San.Inst., City Engineer, Liverpool, &c.: second edition, revised and enlarged (London: E. & F. N. Spoon). This is a new and revised edition of a work we spoke favourably of on its first appearance. Many changes have taken place since ; sanitary science and legislation have made rapid strides, which have rendered necessary a new edition. Mr. Boulnois has compassed these additions and brought his valuable text book up to date. We should again recommend every young as well as old borough surveyor and engineer to read carefully this book on the office and duties of a town surveyor. It deals with every branch of a surveyor's work—roadways of macadam, wood, and asphalte ; kerbway, street obstructions, new streets and buildings, sewage disposal and ventilation of sewers, dwellings, house drainage, markets, abbatoirs, and gives all statutory legislation.

◆

The tender of Messrs. Shillitoe and Sons has been accepted for the new Admiralty Offices, and it is expected that the work will be commenced during the next fortnight under the supervision of the architects, Messrs. Leeming and Leeming, of Westminster.

The Egyptian Government has decided to telegraph to Europe, to an English, a French, and a German engineer, inviting them to come to Cairo on February 5 as a commission for studying the projects for the drainage of the city. Their stay will be six weeks, and their remuneration £600.

Building Intelligence.

High Wycombe.—The High Wycombe Cottage Hospital has been recently enlarged, and endowed with a sum of about £2,800, granted by the trustees of the Earl of Beaconsfield Memorial Fund, from the surplus at their disposal. The new buildings consist of a large operation and convalescent room, bath room, heated linen-chamber, and other conveniences, costing, with an additional piece of land, about £800. The new buildings were opened by Mr. Coningsby Disraeli, the heir of the late Earl, on the 19th ult., and Mr. Disraeli was afterwards entertained to luncheon at the Town Hall, Wycombe. Mr. Arthur Vernon, F.S.I., of 26, Great George-street, Westminster, and High Wycombe, was the architect, he having been the architect also of the new buildings which were erected in 1875 ; and Mr. H. Flint, of High Wycombe, was the contractor.

Leeds.—New offices are in course of erection in Park-row and Basinghall-street, Leeds, for the Prudential Assurance Co., from plans by Mr. A. Waterhouse, R.A. The building covers a site of about 105ft. along Park-row by 109ft. from Park-row to Basinghall-street, and the estimated cost of erection is nearly £40,000. On the ground floor to right of entrance are public office (41ft. by 36ft.), manager's private room, waiting-rooms, lavatories, strong room, and a large office in the basement, with the usual storage rooms and heating chamber. On the left-hand side of the central entrance is an office, also 41ft. by 36ft., and at the rear is an art gallery 100ft. long and 18ft. high, with a high side aisle, and ample storage and lavatory accommodation. In the basement floor are eleven large strong-rooms, for the use of tenants. Above the roof of the art gallery the building is divided into two blocks, with an area between 20ft. wide and 104ft. long. Each block is provided with a large staircase, and they are connected by bridges. There will be 73 rooms to let, suitable for business chambers. The whole work is carried on under the supervision of Mr. William Bruce, clerk of works.

Osborne House, I.W.—Her Majesty has lately, a daily newspaper remarks, made an important addition to Osborne House. It consists of a new wing, corresponding externally with the Italian architecture of the Palace. A broad corridor connects the new building with the pavilion in which are situated the Queen's apartments. The principal feature of the extension is an Indian Room, which is not quite completed. A musicians' gallery has been erected at one end of this hall, which measures 30ft. by 60ft. The chamber is remarkable for the richness of its decoration, which is still in white, but hereafter the mouldings will be coloured. They have been executed under the superintendence of Ram Singh, Professor of Art at Lahore University, who, together with Mr. Mann, the builder, has been busy since March, 1890, in the adornment of the ceiling and walls. A beautiful dado, with a Sikh-work moulding, skirts the room. Between the pilasters there are diaper panels, surmounted by an ornate cornice, having a cove above it, in the Moorish style. Over one door a Hindoo idol appears. The materials used for the work have been *carton pierre*, fibrous plaster, and papier-maché.

West Smithfield.—The work of restoration at St. Bartholomew the Great is making steady progress under the direction and plans of Mr. Aston Webb. Since the south transept was opened in March, the triforium arches have been opened up, and the roof over the south triforium has been reconstructed, while that on the north side (occupied till quite recently by the boys' school of the parish) has been repaired. The Norman vaulting below both of these triforia, which has been long destroyed, has now been renewed throughout. The opening of the north triforium gives access by a spiral stone staircase to Prior Bolton's window. The old brick tower is to be retained after being strengthened by iron ties, and the copings reset and repoin throughout in cement. A stone porch w shortly be added. The pre-Reformation peal five bells has been turned, rehung, and set i ringing order. The north transept is to be taken in hand next.

◆

The Stockton town council, by twenty-one votes to six, decided on Tuesday to open the Free Library newsroom from 3 p.m. to 9 p.m. on Sundays.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. S. and Co.—F. N. D.—Anglice.—T. M.—D. and S. Co.—P. T. (Bristol).

"BUILDING NEWS" DESIGNING CLUB.

T. H. Bishop, "Excelsior," E. J. Taylor, R. B. Burgen, and others.—(The site for the parish hall is exactly what we stated. The widest end is to be 55ft. wide, and the two sides are to be each 90ft. long inclining inwards at the same angle in straight lines towards the narrow end, which is to be 30ft. wide. This triangular plot in geometrical terms is really a trapezium—a quadrilateral figure, the two ends being parallel.)

◆

Intercommunication.

QUESTIONS.

[10688.]—**Testing Mortar.**—I want to know if any one could let me know how I could test mortar as to its strength, after it is made up? I am building some houses, and now that the frost and wet weather have set in, the mortar does not set the way it did two months ago, although it is the same; and the man over the job says the mortar is bad—too little lime in it, so I want to know how it could be tested, for he says some of it will have to come down, and it is contract.—A. D.

[10689.]—**Earth Closets.**—Would any correspondent having experience in fitting up earth-closets, &c., say what they would recommend as most suitable for a country school?—E. C.

[10690.]—**Grain.**—Can any of your correspondents give any information upon the theory or experience of the pressure, vertical or lateral, exerted by grain, stored on the American system in bins 10ft. to 12ft. square and 50ft. to 60ft. high, provided with copper bottoms?—T. M.

[10691.]—**Fascia.**—Will some reader kindly inform me the best way to secure a stone fascia to an iron girder supporting a brick shopfront, and how the soffit should be fixed? Also would a 5in. trussed partition be sufficient for external work, the said partition to carry one floor, and the roof of an ordinary dwelling-house, about, say, 20ft. span?—Excalibur.

[10692.]—**Temple of Minerva at Priene.**—In the intermediate exam., R.I.B.A., the student is required to give a short description of the buildings from which his drawings are taken. Could any reader furnish me with a few particulars as to the plan, &c. (whether hexastyle, &c.), of the temple of Minerva Polias at Priene? I have been through several books on Classic architecture which, while they give details of columns and mouldings, &c., do not give complete plan of the interior.—A Student.

[10693.]—**Paste.**—Will a correspondent kindly inform me how to make paste for stretching drawings? Is not size a good thing to mix with this paste?—Junior Draughtsman.

[10694.] — **Protractor.** — Will any reader kindly describe the construction and use of an instrument used largely by mining engineers, and thus constructed: The semicircle is divided like a common protractor by radii every 10° apart, and from their extremities on the circle perpendicular lines are drawn, forming sines of the angles formed by each of the radii. The centre has a number of concentric circles, and at the intersection of the radii and vertical lines are small circles round the perimeter.—P.

REPLIES.

[10686.] — **Bookkeeping.** — If "Seven Years' Reader" will write me, I can let him or any other reader have worked examples of a good system to suit contractor or jobbing builder.—F. J. W., Eastbourne House, Argyle-street, Ryde, I.W.

Legal.

MORE ABOUT TENDERS.

As an invitation to tender may be revoked on the one side, so also can an actual tender be withdrawn on the other, at any time before acceptance, and provided it is not under seal. But if the tender has been accepted, then there is a contract, binding, and based upon a good consideration. The question as to when this acceptance is complete depends on the facts and documents of each case. It has happened that the acceptance of a builder's tender has been brought about by his paying the architect or surveyor a secret commission for that very purpose. The law looks upon this as bribery of an agent to the prejudice of his principal, and if discovered in time the employer can avoid the contract altogether, or he can, if he has gone on, recover by action both the bribe paid to his agent and damages for this wrongful act from the party bribing. Supposing a tender is accepted by an unauthorised agent, this acceptance will be void unless it has been ratified by the employer, at all events before the time from which the contract was to begin, when it will relate back to the date of such acceptance. Of course, in construing the meaning of a tender it must be read along with the invitation, for both documents have to be taken together to form the one written contract.

It has happened that competing builders and contractors have entered into an agreement not to tender, or to tender high, for certain work. This arrangement looks something like a "corner," or a "knock-out" at an auction, for the plan adopted is to let one of the combination get the job on his tender upon his agreement to buy materials of the others, or for some such similar consideration. In one case, in 1875, the Court of Chancery held that there was nothing illegal in such an agreement, on the ground that owners of commodities may arrange amongst themselves to sell at a certain price, leaving one of them to make any other profit he can. So an agreement between two or more persons not to tender or bid against each other has been held valid. But the great case of the *Mogul Steamship Copany*, lately decided in favour of this right of combination by the House of Lords, now comes in here, as elsewhere. As the result of that judgment it seems clear that all such combinations between traders not to tender or not to bid would be perfectly legal and valid so long as the arrangement was for *bonâ fide* business purposes, and had no malicious object, nor was directly aimed at injuring other persons.

Fred Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Architect.—Mistakes in Quantities.—If the builder, as appears to be the case here, has paid the quantity surveyor's charges, and the quantities have not been supplied to him in the usual way, he will have a remedy by action against that surveyor for damage arising from mistakes in the quantities thus supplied him, and upon which he has relied in carrying out his work.

X. Y. Z.—Certificate.—The point in this case is whether the vendor or the purchaser of the leasehold house is to pay the surveyor's charges for his certificate as to completion of repairs. But as the vendor as lessee was bound by his covenant with the lessor to put the premises in thorough repair to the satisfaction of the surveyor, the doing so became part of his title to the property, and thus he must pay the charges.

STAINED GLASS.

Giggleswick.—Two stained-glass windows have been fixed in Giggleswick church, Yorks. The chancel window contains the subjects of the Crucifixion and Ascension, under canopies of a Late period. The west window of the north aisle has the subject of the Presentation in the Temple, in three lights, under canopies. They are memorials to members of the Hartley family, and were executed by Mr. T. W. Camm, "The Studio," Smethwick.

◆

LEGAL INTELLIGENCE.

Extras and Penalties.—Griffiths and Wood v. Rowlands.—The plaintiffs in this case, heard at Pontypridd County Court on Friday, were builders, and the defendant was a watchmaker at Ynysybwl. The claim was for £42, being the balance due on a building contract and extras thereon. The defendant counterclaimed for £73, for penalties for not completing the building in time, and in respect of alleged omissions from the contract. After a hearing extending over several hours, the judge came to the conclusion that the plaintiffs had established their claim in full. He held that the defendant could not recover any of the penalties, as the delay had arisen through his own fault in neglecting to supply the ironmongery. He awarded him, however, £19 on certain other items in his counterclaim, and directed judgment to be entered for the plaintiffs for £23, giving them all the costs of the action.

A Main Roads Arbitration.—A dispute between the Hampshire County Council and the Bournemouth Town Council respecting the cost of maintaining main roads through Bournemouth was decided a few days ago. The length of road was three and a half miles. The Town Council originally claimed £1,868, which was refused by the County Council on the ground that it was exorbitant. The County Council offered £1,400. This was refused by the Town Council on the advice of the borough surveyor, Mr. F. W. Lacey, by whom this claim was amended. The matter was ultimately referred to the arbitration of the Local Government Board, and in July last Mr. T. Codrington, M.I.C.E., attended at Bournemouth for that purpose. Besides Mr. F. W. Lacey, the borough surveyor, Mr. C. Jones, of Ealing, Mr. William Weaver, of Kensington, and Mr. J. Strachan, of Brentford, gave evidence for the Town Council; and Mr. Jas. Robinson, county surveyor for Hampshire, Mr. Fletcher, county surveyor of Dorsetshire, Mr. Thos. de Courcy Meade, of Hornsey, Mr. Robt. Phillips, county surveyor of Gloucestershire, and Mr. Chas. Tomes, borough surveyor of Eastbourne, for the County Council. The award has now been settled at £2,608, nearly £800 in excess of the original claim.

◆

WATER SUPPLY AND SANITARY MATTERS.

Hayes, Middlesex. — A Local Government Board inquiry was held on the 31st ult., with respect to the application of the Uxbridge Union Rural Sanitary Authority for the sanction of the Local Government Board to their borrowing £10,500 for the purposes of sewerage and sewage disposal for the parish of Hayes. Details were given in connection with the application, of which the inspector, Col. Ducat, R.E., took notes, and promised to report thereon in due course to the Local Government Board. The engineer to the scheme is Mr. Frederick Beesley, M.I.C.E., of Westminster. The system proposed for dealing with the sewage is that known as the International Purification Co.'s process.

West Ham.—At the town hall, Stratford, on Tuesday, Colonel J. Ord Hasted, R.E., one of the inspectors of the Local Government Board, held a public inquiry as to the application of the West Ham Corporation for power to borrow £92,334 for various purposes of public improvement. Mr. F. E. Hilleary, the town clerk, and Mr. Lewis Angell, the borough engineer, represented the corporation. The applications included £24,234 for sewerage works and street improvements; £26,000 for the purchase and laying out of a public pleasure ground for South West Ham, having an area of nearly 19 acres; and £16,000 for the erection of two free public libraries—one in the Barking-road and one at Stratford—this amount being required for the erection and fitting (apart from books) of these libraries. Power was also sought to borrow £23,000 for the erection of a public hall and municipal buildings at Barking-road, and £2,000 for an organ in the town-hall at Stratford.

◆

A new convalescent hospital has been erected at Swanley, Kent, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Our Office Table.

The first of the lectures to students at the Royal Academy for the present session was delivered on Monday evening last by Mr. J. E. Hodgson, R.A., Professor of Painting at the Academy, who gave No. 1 of a course of six lectures on "Ancient and Modern Painters: their Technique." The second of the series was given last night (Thursday), and the course will be continued on Monday and Thursday evenings during the next fortnight. The lectures on sculpture will be delivered by Mr. A. S. Murray, Keeper of the Greek and Roman Antiquities in the British Museum, on February 15th, 18th, and 22nd, the subject being "Archaic compared with Archaistic Sculpture." Professor George Aitchison, A.R.A., will take up a course of six lectures on "Saracenic and Turkish Architecture," the dates fixed for these being Jan. 25th and 28th, and Feb. 1st, 4th, 8th, and 11th. Professor J. Henry Middleton, of Cambridge, will continue his lectures on "Michael Angelo" from last year's course on Feb. 26th and March 4th and 7th.

M. Antoine Nicolas Bailly, formerly architect of the city of Paris, has only survived his successor about a month, having died on Friday night at the age of 81 years. The Hôtel de Ville, which was destroyed by the Communists in 1871, has been restored and rebuilt under the direction of M. Bailly, who likewise designed the Tribunal of Commerce and many other public buildings in Paris. He also restored the Cathedral of Bourges. He was a member of the Institut de France, and had been an hon. corresponding member of the R.I.B.A. since 1867.

Mr. J. Dawson Watson, R.W.S., R.C.A., died on Sunday, at his residence at Conway, aged 60 years. He was a pupil of Alexander Davis Cooper, and a student of the Royal Academy. He exhibited his first picture, "The Wounded Cavalier," at the Royal Institution, Manchester, in 1851. He exhibited at the Royal Academy for the first time in 1853, "An Artist's Studio," his subsequent principal works being, "Thinking it Out," "The Poisoned Cup," "The Student," "The Parting," "Saved," "Black to Move," and "Women's Work." Since 1860 he had contributed wood-drawings to most of the illustrated books, papers, and magazines. Of his drawings hung at the Society of Water-Colour Painters, the principal were "The Duet," "Book-Lore," "Carrying in the Peacock," and "The Stolen Marriage." Mr. Watson leaves a widow and three children.

Dr. B. W. Richardson, F.R.S., in his annual address as president of the Sanitary Inspectors' Association, delivered at Carpenters' Hall on Saturday evening, congratulated the members on having obtained incorporation, and recommended them to form a thoroughly organised school, in which inspectors could obtain instruction in at least six subjects—viz., physiology, natural history, chemistry as it concerned sanitation, and natural, theoretical, and moral hygiene. He pointed out that vital statistics showed a reduction of late years in the number of deaths from zymotic diseases and from consumption. But diseases of the nervous system and cancer had increased, and suicide was certainly increasing.

We have on our desk the new price list of the original Wolston's Torbay paints, manufactured by the Torbay and Dart Paint Company, Ltd., of 23, Great George-street, Westminster, and of Dartmouth and Brixham, Torbay. These paints have been very largely used by the Office of Works, Admiralty, War, and Colonial Departments, as well as by the London County Council and the railway companies. The merits of the Torbay paints for exterior painting of wood and iron, particularly the brown and red paints, are fully recognised. The reds, manufactured from oxide of iron finely ground, are used for ironwork, girders, bridges, for which uses the Torbay reds are very admirably adapted, as they protect iron and resist intense heat. A very large percentage (92·30) is composed of peroxide of iron. The price list gives not only the names of the colours ground in oil paste and mixed ready for use, but sample colours of various shades, so that any desired tint can be specified. The prices are moderate, and special quotations are given for large quantities. The celebrated Torbay brown is only 30s. per cwt. ground in oil, and 4s. gallon, ready mixed. Some very delicate shades of stone colour, greys, greens, blues, and reds are to be obtained, admirably adapted for internal decoration and wall painting.

One of the most useful and business-like looking diaries for the new year is that issued by Messrs. Hayward Bros. and Eckstein, of 187, Union-street, Southwark, the well-known makers of the patent semi-prism pavement lights, which are such ubiquitous objects in our footways. Now more than ever is the daylight in dark places necessary which this admirable invention insures, when gas is going up to ruinous figures per thousand, and growing more like the gleam of a rushlight with the appearance of every fog. The diary is handily interleaved with blotting-paper, and there is scarcely a page which does not carry memoranda and statistics of daily use to architects, besides opportune reminders of the numerous branches in which Messrs. Hayward Bros. and Eckstein are *facile princeps*. A useful diary like this, we should say, stands far more chance of being preserved throughout the year than the best possible catalogue or price list. This is all three in one.

MEETINGS FOR THE ENSUING WEEK.

Monday. — Liverpool Architectural Society special meeting. 8 p.m.

Tuesday.—Society of Arts. "The Laos States of Upper Siam," by Ernest Satow, C.M.G. 4.30 p.m.

Society of Architects. "Baths and Bath-houses," by R Owen Allsop. St. James's Hall, Piccadilly. 8 p.m.

Sheffield Society of Architects and Surveyors. 8 p.m.

Wednesday.—Society of Arts. "Three States of Matter: Solid, Liquid, and Gaseous," by Professor John M. Thomson, sec. C.S. 7 p.m.

Thursday. — Edinburgh Architectural Association. "Heriot's Hospital and Co-temporary Work," by Hippolyte J. Blanc. 8 p.m.

CHIPS.

The Royal Institute of British Architects has voted the sum of £300, spread over three years, towards the general fund of the Architectural Association's new educational scheme.

The late Mr. Thomas Nunn Debenham, of the firm of Debenham, Tewson, and Co., 80, Cheapside, surveyor, who died in Egypt on Nov. 12 last, aged 54 years, left personalty valued at £28,319.

The death of Mr. Shepton, builder and contractor, took place at his residence, Dumfries-place, Cardiff, on Friday, from bronchitis, at the age of 60 years. Mr. Shepton had been in business in Cardiff as a builder and contractor for 30 years, and had carried out several important public works, including the Government Post Office, the restoration of the parish church of St. John the Baptist, the building of St. Saviour's and St. German's Churches, Splotlands, and some of the most important business premises in Cardiff.

Prince Victor of Hohenlohe, who died a week ago, was better known in the artistic world as Count Gleichen, under which title he had often exhibited at the Academy and Grosvenor Gallery. His chief works included a group called "The Deluge," an ideal figure for his mother's grave, a statue of Admiral Sir George Seymour; a colossal statue of Alfred the Great, in Sicilian marble, unveiled at Wantage by the Prince of Wales in 1877; and many statuettes and busts of the members of the Royal family.

Mr. William Naylor, of the borough engineers' staff, Wolverhampton, has been appointed chief engineering inspector to the River Ribble joint committee at a salary of £250 a year.

A new cottage hospital for Ledbury, built at a cost of £3,000, solely borne by Mr. M. Biddulph, M.P., was opened last week. Mr. Hudson, of Malvern, was the architect, and Mr. George Hill, of Ledbury, the contractor. The style is Elizabethan.

In the case of Henry Bowman, of York, builder, an order has been made in the local Bankruptcy Court suspending the discharge for two years; and in that of John Frederick Wetherall, of Wimbledon, builder, trading with J. Munday as J. Munday and Co., builders, a like order of suspension of discharge for two years has been made.

On Sunday evening Mr. Geo. Nelson Haden, senior partner in the firm of Messrs. Haden and Sons, engineers, died at his residence in Polebarn-lane, Trowbridge, from the effects of an attack of influenza. For many years the deceased, who was 74 years of age, took a prominent interest in public matters, and occupied a seat on the local board, in addition to being an alderman on the County Council.

Trade News.

WAGES MOVEMENTS.

Productive Co-operation in the Building Trade. — A public meeting, convened by the Builders' Co-operative Society, Limited, was recently held in the St. Martin's Tavern, Pratt-street, Camden Town. The object was to make known the aims and objects of the society, and to enrol members. Mr. H. Aston, secretary of the society, explained that the society was to be managed on similar lines to the Amalgamated Union of Carpenters and Joiners. The society had been duly registered, and already about 150 shares had been taken up. Their capital was invested in freehold land. Mr. Vivian, from the Labour Association, gave out that the object of the society was to carry out the trade of building in all its grades. They hoped to have branches, before long, in all parts of London, in which all the members of the building trade, bricklayers, plasterers, &c., could take an active part. Those branches would elect their council by a delegate from each lodge. The society otherwise would be managed by an executive of nine, elected by the members themselves, two of that number retiring after six months. The society intended to purchase ground in a neighbourhood where a large number of those employed in the building trade resided. All profits would be divided between the worker and tenant.

The workshops of Mr. S. Salt, builder, of Turners-road, Limehouse, were burnt out on Wednesday.

By the death this week of Mr. Charles Heisch, the office of Gas Examiner to the Corporation of London, which he had held since 1869, becomes vacant. It is the gift of the Court of Common Council. The gross salary is £855, but after payment of assistants and rent of office, the net emolument amounts to £425.

The discontent which had been smouldering for some time among the members of the Society of Stoneworkers at the port of St. Sampson's, Guernsey, has broken out afresh this week. The present grievance consists in the Society refusing consent to the merchants appointing the cargo-trimmers, which they have hitherto done.

At the monthly meeting of the Liverpool City Council on Friday, £15,250 was voted for the Insanitary Property and Artisans' Dwellings Committee. The chairman of the committee stated that £20,000 more would be required during the year to carry on the policy of the committee.

Thirteen pictures by Dutch masters of the 17th century have just been added to the National Gallery by purchase from the collection of Herr Habich, of Cassels. The price paid was £2,800.

On Sunday the nave of the parish church of Kettering was used for the first time after restoration, which has cost £4,000. The screen has been removed from the arch tower, the galleries have been taken down, and oak seats have replaced the straight-backed pews. There remains £2,500 to be raised before the restoration is completed.

A dispute between the Hampshire County Council and the Bournemouth Town Council respecting the cost of maintaining the main roads through Bournemouth was decided on Friday. The length of road is 3½ miles. The town council originally claimed £1,868, which was refused by the county council, on the ground that it was exorbitant. The county council offered £1,400, which was refused. The Local Government Board have now decided that the county council must pay £2,608.

Mr. William Putney, of Chalkpit House, Dorking, and a member of the firm of Messrs. Putney Brothers, builders and contractors, died on Thursday morning in last week. He was very well known in the town, and had for many years carried on a large contractor's business with his brothers, Messrs. James and John Putney. He leaves a widow, but no family.

Mr. E. H. Shorland, of Manchester, has just supplied his patent Manchester grates to the workhouse, York.

The death occurred on Friday of Mr. R. Fenwick Boyd, of Brentwood, Essex, eldest son of the late Mr. E. F. Boyd, of Leamside, Durham, who succeeded his father as consulting engineer to the Ecclesiastical Commissioners. Mr. Boyd was 39 years of age.

A new stained-glass window in the south clerestory of the nave of Manchester Cathedral, given as a memorial of the late Mr. James Hatton, has been formally unveiled this week.

The personal estate of the late Mr. Alfred Henry Haggis, of Heathfield, Thornton-heath, Croydon, Deputy Chairman of the London County Council, who died on the 24th November last, has been sworn of the value of £8,979 by the executors, his sons, sawmill proprietors.

FRIDAY, JANUARY 15, 1892.

COMPETITIONS WITH THE LATEST IMPROVEMENTS.

IT may be fairly questioned whether the last ten years' progress in the management of competitions has not been, for most architects, a progress of out of the frying pan into the fire. Matters were bad enough under the old system. The selection of a design then rested, in most cases, solely with non-professional judges. They made a better or worse choice, as they happened to have more or less common sense and more or less natural or good taste. In some cases they chose very badly; but not infrequently they showed a knowledge of their own requirements, which is sometimes lacking to the "professional assessor," and they did not usually accumulate on the heads of the unfortunate competitors a long series of demands and regulations and penalties. Nor did they invent the system of compound competition, in which architects, by scores or hundreds, spend months of time in competing for the honour of afterwards being allowed to compete for a building. These are things which architects have brought on themselves. The question is whether they and their art are the better or the worse for them.

Compound competitions were first advocated with the idea of saving labour and expense. Instead of saving they have greatly increased them. Tempted by the apparent easiness of making mere "preliminary sketches," more men than before take part in almost every contest; but they often find, on taking up the matter in earnest, that the "preliminary sketches" are not sketches at all. A sketch is the shadowing out of a first idea not yet perfect or everywhere definite. It is a general conception not worked out in detail, and not professing to deal with every minor problem in construction or even in arrangement. A preliminary sketch leaves such things for consideration at a further stage, and does not profess to show, for instance, how every flue is going to be carried up, or how every bit of wall on the ground floor is going to be supported in the basement. It asks to be judged by the goodness of its main ideas, not by the perfection to which each subordinate item has been brought. The time for dealing with subordinate items comes when the general scheme has been approved, and not before.

If the "preliminary sketches" asked for in a compound competition could have been strictly kept down to this level, competitions of that type might really have been a blessing and not a curse. This, however, seems to have been found impracticable. Instead of an open competition of sketches, and a subsequent limited competition of well-studied drawings, there have usually been two successive competitions of elaborated plans. The first, it is true, have been smaller in scale than the second; but in other points both have been of the same order. If the preliminary plans have been to 1-16th scale, and the subsequent ones to $\frac{1}{8}$th scale, the former have been so detailed and so definite that they might almost as well have been drawn to the larger scale at once. What makes the labour in a competition is not the drawing, but the thinking. If one has to think out to its solution every doubtful point, one may as well exhibit the result on a scale large enough to show the entire scheme. Now, the instructions issued for these so-called "preliminary sketches" have commonly been drawn up with such minuteness, and have asked for so much and such definite information, that they have called for nearly as much thought and study as would suffice for finished plans. Being drawn up by an architect, too, these instructions ask for particulars which it never occurred to non-professional judges to require. Amongst these things are schedules showing the areas of rooms and the cubing-up of different parts of the building. No doubt they greatly facilitate an assessor's work; but they add materially, if not very heavily, to the lost labour of the unsuccessful architects.

To gain a commission of any importance, the competing architect has now to give nearly twice as much labour as he had to give ten years ago. If this labour went towards the improvement of the building, there might be much to say for it; but this is just what it does not do. Most of it goes in mere mechanical work, and in making two sets of nearly identical drawings instead of one set. The unsuccessful competitors have weeks, or months, of their time wasted on minor questions, which never need have been put before them. When their plans go in, a great proportion can be rejected at a glance, on the ground that the general scheme is bad. Why could not the matter have been so arranged that, in the first instance, general schemes *only* were submitted and adjudicated upon?

The fact is, that these preliminary competitions, with their demand for precision and detail, for information and exactness, have turned out to be something very different from what was expected. The term "sketch designs" originally suggested to architects two or three sheets of paper, or cardboard, containing pencil plans and sections, and elevations, to a really small scale. It has been found, on the contrary, to mean a whole set of show drawings, got up with care, outlined in ink, so that everything is sharp and clear,—worked out to exhibit every item of planning and arrangement, and mounted on purpose-made stretchers of a specified size. It has been found to mean, not the making of such preliminary sketches as would suffice for the average client, but the working under the eye of an acute and accomplished assessor, who will detect every slip and every omission, and mark them down against their authors. It has been found to mean that a good general conception has less chance than it used to have, unless it issues from its author's brain fully armed against criticism at every point. It has been found to mean that the best chance rests not with the man who would finally produce the best building, but rather with him who can produce, at the first start, the design most free from minor faults and unsolved problems of the smaller sort. It plays into the hands of a few clever men of this type, and leaves the rest almost without a chance.

The compound competition system, so far, has not fulfilled its promise. What is to be substituted for it if it goes? Not a return to the old want of system, of course. But there seem to be two alternatives possible. A double competition might be so managed that the sketches should be real sketches, and that only general schemes of plan and composition could be sent in at first. Then the working out of secondary points would be confined to the few selected competitors in the second stage. That would be one way out of the difficulty. The other way is to have only a single competition, but to insist on a smaller scale than formerly, and to keep perspectives down to a uniform small size. A scale 12ft. to an inch is amply large enough for most competitions, and so is a perspective as big as a double-page of the BUILDING NEWS. In every case, moreover, clear information about the surroundings of the site should be given. It is grievous to think, for instance, of the miserable waste of time for want of such information in a competition like that for the Sheffield Municipal Buildings. Men not lacking in ability here bestowed weeks of labour, which they could ill afford to throw away, in schemes which would never have entered their heads had they been told the simplest facts about the surroundings. They saw on plan only a very narrow passage next the churchyard, and little supposed that this was the best lighted side, or that which would be most conspicuously seen. Hence design after design could be thrown out at a glance, however great its practical or artistic merits. If these had been mere sketch designs, such as we have advocated, it would have been less of a pity; but, as it was, they had been worked out in many respects with minute care. No amount of ability could avail anything against this lack of simple information. The promoters, who might have had at their disposal all the skill thus misdirected, were practically deprived of it, and the architects thus left in the dark spent their days and nights on schemes which, as any Sheffield street-boy could have told them, could never receive a moment's serious consideration. It may be said that these architects should have gone and seen the site for themselves. Perhaps so, but this had not been made a condition, and six weeks' hard labour (if we may take that as the average of what they underwent) is a severe penalty for infringing a rule which was never stated.

◆

REMOVAL OF SNOW FROM TOWN STREETS.

ON giving some few instances of the removal of snow from town streets, by carting it away, in the BUILDING NEWS of Oct. 30 last, we intimated the intention to follow up the subject by showing how it may be better dealt with by melting it *in situ*, and as the coal gas used for lighting the streets and houses is not used by day it seems to afford the best source of heat for the purpose, although no doubt greater heat could be derived from petroleum. We shall, however, confine our remarks to the use of gas. In the economy of municipal management each department has its special committee, and when the gasworks belong to the town authority there seems to be reason to suppose that the gas committees would afford some facilities to the streets and scavenging committees in the use of gas for the purpose in question, especially in the day time, and would charge that committee with the cost of manufacture only, or but a slight addition to it, and that in most cases 2s. per 1,000ft. would be a sufficient charge for one committee to make upon the other. Another facility which might be afforded where the gasworks belong to the town authority would be that the ordinary day pressure might be increased on the occurrence of snow-falls. But perhaps in any case, whether the gasworks belong to the town's inhabitants generally or to a company, there would be no great difficulty in the matter if the charge be made 2s. 6d. per 1,000ft.

It was said in our former article on this subject that a cubic foot of snow in the condition to which it is usually reduced before it is removed weighs 8lb. We need not take the extreme case of a snowfall of a foot in depth, but take, for instance, one of 6in. This will probably in most cases measure about 4in. in depth at the time of removal. It will then weigh $2\frac{3}{8}$lb. per square foot, or 24lb. per square yard of street.

If the street be taken at 30ft. wide, there will be 10c.ft. to be removed from every lineal yard. In the following instance we shall take the snow and ice to be removed at 10° of temperature below the freezing point, or at 22°F., and the temperature of the water into which it is melted at 60°F. The heat required to convert a cubic foot of snow and ice weighing 8lb. into water at 60° would be as follows:—

Ice at 22 to ice at 32— 10 × 8 × ·504 (the specific heat of ice) .... =	40	units of heat.
Ice at 32 to water at 32 (the latent heat)— 8 × 192.................... =	1,136	,, ,,
Water at 32 to water at 60— 8 × 28 .... =	224	,, ,,
Units of heat required per cubic foot of snow and ice ..	1,400	,, ,,

The principle on which any such means of removing snow from town streets (that is by melting it) should be based, is that the heat should be taken to the snow rather than that the snow should be brought to the place where the heat might be situated. For this, although the distance to which it might be required to be removed might be but short in comparison with that to which it is now carted before a suitable place of deposit can be found, yet it equally requires filling into the carts and emptying where it would be melted. If an ordinary coal fire were to be adopted to produce the heat required it would have to be stationary; but if gas be the fuel, it can be conveyed in a pipe to any reasonable distance, and there burnt to produce heat sufficient to melt the snow. This would require that the burners be inclosed in a flat box or tray, the bottom and sides being of a non-conducting material, say, fireclay, of which gas retorts are made, and the top of boiler-plate, say, ½in. thick. The area of the top plate, or several plates riveted together, would be proportionate to the number of men employed in shovelling up the snow and placing it upon the apparatus. It would also depend upon the number of gas-jets per square foot which could be arranged underneath it, so that in the whole a sufficient quantity of gas might be burnt for the purpose intended. The rate of transmission of the heat through the plate would also have to be considered. The conducting power of iron, in units of heat transmitted per square foot per hour through a plate 1in. thick, per degree of difference of temperature between the two sides, is stated to be 233, and as the rate of transmission is inversely as the thickness of the plate, it would be 466 units per square foot per hour through a ½in. plate. With regard to the area of plate appropriated to each man shovelling up the snow, he should have about a square yard. He would remove from the street and place upon the snow-melter about 72c.ft. per hour. Four men would remove 288c.ft. per hour. For four men's work the amount of heat required for melting 72 × 4 = 288c.ft. of snow and ice per hour is 288 × 1,400 = 403,200 units per hour, and if the water runs off at a temperature of 60° the temperature underneath the plate would require to be 926° F., the difference being 866°.

According to Box's treatise on Heat before referred to, the conducting power of an iron plate 1in. thick is 233, and for any iron plate is—

$$= \frac{\text{Difference of temperature} \times 233}{\text{Thickness of plate}}$$

For a ½in. plate the quantity of heat transmitted in units per square foot per hour would be $\frac{866 \times 233}{\cdot 5} = 403{,}556$, as required. If the heat practically derivable from coal-gas be taken at 500 units per cubic foot, and 403,200 be required, the amount of gas burnt per hour would be $\frac{403{,}200}{500} = 806$ cubic feet.

The next consideration is how this quantity is to be supplied to the snow-melter, which must be mounted on four low wheels, and pushed along the streets as the snow becomes cleared away, a few yards at a time, the supply of gas being kept up through a flexible pipe of suitable material and construction, so as to be kept distended to its full diameter, and wound round the drum of a hose reel.

The distance apart of the street mains should be 80 or 90 yards, requiring a flexible pipe of that length or a little more—say, 100 yards. If the day pressure of the gas at the burners be made on the occasion of a snowfall of considerable amount, equal to 1in. of water, the diameter of the pipe would require to be 2in. In some of the outlying streets the main itself might not be larger than this, and the system could not well be applied; but every main street has a gas main large enough, used in the daytime, and it is only in the main and secondary streets where the system would be applicable.

If the drum on which the pipe would be wound in a single coil be 4ft. diameter, its length would be 5ft.; so that, mounted on a pair of wheels, it would not be inconveniently wide. The pipe, instead of 2in., might be 2¼in. diameter, and would still lie round the drum in a single coil. The flexible pipe being wound round a drum in this way, and taken to the place of junction with the gas main, and the intervening cock opened after one end of the pipe had been attached, the other end would be attached to the melting apparatus, and the burners lighted; and this attachment would serve for 100 lineal yards of street. If the width were 30ft., and the depth of partly-solidified snow 4in., resulting from a fall of 6in., four men shovelling up snow on to the melter would clear 96 lineal yards of street in 10 hours. All streets are more or less inclined longitudinally, and the removal of snow by the means indicated should be begun at the lower end, or from gully to gully upwards, the number of snow-melters employed at one time being determined by the quickness with which it might be desired to clear the streets.

Reckoning by the lineal yard of street, the weight of snow to be removed would be, as before stated, 240lb., and as each 1lb. weight requires 1,400 units of heat to convert it from ice at 22° F. to water at 60°, the amount of heat required per lineal yard of street would be 240 × 1,400 = 336,000 units. Each cubic foot of gas burnt yields, say, 500 units of heat, and there would be required $\frac{336{,}000}{500} = 672$ cubic feet of gas per lineal yard.

Allowing for the time taken up by the four men in moving the snow-melter along the street as mentioned, the time during which they would be removing 72c.ft. per hour each would be, say, 9 hours a day. The snow removed by four men in a day would be 96 cubic yards, extending along 86 lineal yards of street.

If the gas were charged, for this purpose, at 2s. 6d. per 1,000 feet, the cost for 10 hours' work would be:—

	£.	s.	d.
800 × 10 = 8,000, at 2s. 6d.	1	0	0
Four men's wages at 3s. 6d.	0	14	0
Interest and depreciation of plant	0	6	0
	2	0	0

For this, 96c.yds. of snow would be removed, being at the rate of 5d. per cubic yard.

That is about what it costs now to fill it into carts, and the difference between the two systems is that all the carting would be saved, and, which is of most importance, all the inconvenience of finding places of deposit for the snow. The sewers would receive and carry off the resultant water, as they do now carry off the same depth of rainfall.

With regard to the size of the apparatus for four men's work, and burning 800c.ft. of gas per hour, allowing one square yard to each man, the area would require to be 36sq.ft.; but the area is better determined by the quantity of gas to be burnt under it. If this be 800c.ft. per hour, and there be four burners per square foot, each burning 5c.ft. per hour, the area required would be $\frac{800}{4 \times 5} = 40$sq.ft., and the apparatus might be made 9ft. by 4½ft. The openings in the bottom would be made of such area as to admit the necessary quantity of air for combustion. The outlet pipes or flues might be carried horizontally along the top to dispose of some of the heat remaining in them, and this would be no hindrance to the snow being thrown upon the top of the apparatus. The whole need not stand more than 2½ft. from the ground.

The burners would be of the kind which allow the gas to be consumed most completely, and produce the least smoke, or none at all. The fireclay bottom and sides of the apparatus—say 2in. thick in the bottom and 1¼in. in the sides—would be supported on a light angle-iron frame, set upon four wheels, 18in. diameter, running loose on a square wrought-iron axle. But these and other details need hardly be described at present—more than is required to arrive at an estimate of the entire cost of the machine, which may be, say, from £40 to £50 each set. Perhaps the average number of days in a year on which it would be required for use would be ten, and as 6s. per day is set down as for interest and depreciation of plant, that would be at the rate of from 7½ per cent. to 6 per cent. per annum on the outlay.

We take, it will be observed, only the street widths in estimating the quantity of snow, &c., to be removed. Some who have treated of this subject of the removal of snow have included the whole area of the town, and so have come to wrong conclusions as to the difficulties. No doubt they are right as to the quantity which falls during a snowstorm, but it is only that part which greatly inconveniences public traffic that the town authorities will undertake the removal of. Moreover, we have not in the above instance taken the greatest possible depth, but only one which the more often occurs, and is yet great enough to cause serious inconvenience to traffic. This is better than going to the extreme conditions of the problem.

PHYSICAL LAWS OPERATIVE IN BUILDING.

MATERIALS employed in building are practically assumed to be inert and rigid, incapable of any change or deterioration, unaffected even by any physical laws. A building is supposed to be a structure rigidly connected in its several parts, and, although composed of various substances, so far homogeneous as to require on the part of architect and builder only ordinary precautions. Actual experience has demonstrated these to be gratuitous assumptions. Stones and bricks and cements are affected by moisture and temperature, timber and joinery soon indicate signs of decay, iron corrodes or becomes oxidised, expands and contracts under heat and cold, and other fabrics are subject to chemical, physical laws more or less detrimental to a lengthened existence. In fact, agencies are at work which operate to produce movement and reaction on the several parts, and by various physical and chemical actions to hasten the disintegration of the building. The skilful constructor and designer knows how to select and combine his materials for the purpose of as far as possible neutralising these effects. He knows, for example, what stones to use to resist the disintegrating agencies of the atmosphere and the acids it holds in suspension; he sees that they are laid on their natural beds, so that the atmospheric agencies should not injuriously affect them; he adopts certain means of protecting walls and the face-work from wind and rain, of uniting or dowelling the masonry exposed by such metals or substances that will not cause splitting or fracture; he selects timber and deals that are properly dried and seasoned, giving them sufficient means of play to prevent cracking by shrinkage, or making the boards and panels narrow to minimise shrinkage; he allows compensation to his iron beams, girders, and roofs, and by a careful consideration of the properties of various substances and the forces to which they are exposed, he adjusts their connection in the most desirable manner. Unfortunately, these precautions are seldom taken. Physical laws are not so well understood as they ought to be, or architects are too much absorbed in producing visible results, to pay much attention to these matters. We are constantly seeing failures as the result: walls that are pushed out of perpendicular by imperfectly designed or constructed roofs, piers thrust out of the vertical by arches, or crushed by overweight, rapid decay of stone walls, the splitting of stone masonry by oxidised iron bolts and cramps, chemical action, and acids destroying metalwork and roofs.

The forces which we have to guard ourselves against are chiefly gravity, the atmosphere, heat and cold, and moisture, capillarity, chemical affinity, and electricity. Each of these agencies would require more than one article in itself in treating building materials, and we can, therefore, merely discuss, in a very general manner, a few instances of neglect. The properties of certain building materials like stone and brick and cement, and the agencies to which they are exposed, are pretty well known and understood, though the preventive means to arrest disintegration and chemical action are very seldom applied. The effects of heat and cold, for instance, produce actions that tend to facilitate decay. All substances are exposed to expansion and contraction, and stone and brick and concrete are no exceptions to the rule. This law has not been recognised. The coefficient of expansion may be small, but sufficient to make it a factor in considering modes of construction and preservation. For example, the outside surface of stone is expanded and contracted by variation of temperature, and any chemical solution introduced into the outer surface or pores may not expand or contract in the same ratio as the stone itself. From experiments made it appears that the process for hardening and preserving calcareous stones known as "Fluate" has the advantage that expansion and contraction between 50° and 380° of the fluated stone is the same as that of the untreated stone. Any material or silicate process which expands or contracts more than the stone must necessarily fail and disintegration ensue.

We believe a great deal of the decay and exfoliation of the surface of some stones proceeds from the alternate effects of heat and cold under different conditions of dryness and moisture. These conditions set up a mechanical action which destroys the cohesion of the particles. Paints, stoppings, solutions, and varnishes applied to stone surfaces to preserve the stone fail from the reason we have stated; they either imprison the moisture, which during frosty weather expands and cracks the stone, or they expand and contract unequally. In these and many other cases mechanical action is set up in the material, mainly owing to the law of contraction and expansion due to cold and heat, and almost every part of a building is exposed to this action, either by the unequal movements of materials like stone and iron, subjected to variations of temperature, to the expansion of water in masonry, to gravity, and other recondite causes.

The force of gravity acts in many more ways than we are wont to expect. We know all about unstable structures, wind-pressure, thrusts, and so on, and we can, or ought to, provide for these forces, but there are many more unsuspected ways in which gravity acts. That subtle and ever-active force is busy at all times, and at work in dislocating masonry, fracturing lintels and window-heads, rendering cornices insecure, in throwing out of vertical walls and chimneys, in the subsidence of floors and partitions. How few architects take into account the action of sun and wind on chimney-stacks. A chimney-shaft gets saturated by rain, a frost sets in and a rapid thaw supervenes, the effect of which unequal thawing on both sides of the shaft, or the evaporation on the sunny side, is to cause the structure to bend over on the thawed or evaporated side, and consequently to disturb the equilibrium. The bend thus caused does not right itself, but becomes more aggravated at every repetition of the same agencies. It is like wedging the joints of brickwork on one side and loosening them on the other, thus bringing the weight on the contracted side. We have frequently seen walls curved or thrown out of perpendicular by the mere action of the sun. This case of disturbance may be attributed primarily not to gravity, but to the action of the atmosphere, heat, and cold in causing the force of gravity to assert itself. In this manner frost is a great enemy of structures by disturbing the original equilibrium and creating dangerous forces, which become more destructive each time. Structures like towers and turrets of masonry exposed to frost and strong sun may be built in perfect equilibrium, but may be seriously impaired by their united action (if the joints are porous or the mortar inferior), combined with other forces. Overhanging masonry, like a cornice, is a source of risk if ample anchoring or counterbalance are not provided. An overhanging mass, such as a heavy cornice, by shifting the centre of gravity of a wall, and throwing the weight on the outer toe of the foundation, may injuriously affect the stability. So, too, weighted arches, by being always active for mischief, require careful designing. The piers or walls on which they abut are exposed to lateral, as well as vertical, forces, which tend, should the foundations or footings be weak, to deflect from the perpendicular. At the corners of buildings this movement is most apparent. Even the bending of girders and beams under heavy loads creates lateral, instead of vertical, pressure, as the girder bears more on the inner edge of the piers than uniformly over the whole bearing. We know the action of roofs which are not properly restrained at the springing, and the same action is produced by the sagging of rafters. Also in many old and badly-constructed buildings floors deflect, as the pressure is no longer vertical, the weight being transferred to the inner edge of the wall. Then we have frame partitions which have sunk owing to defective bracing, which also causes a racking action on the sustaining walls. The effects of vibration on the floors of factories caused by machinery are also disturbing agencies, especially if the waves of vibration are not simultaneous with the movement of other parts of the structure, a fact that has been pointed out in the destructive effect caused by quickly vibrating machines in factories, and the swing of bells in towers of masonry.

Architects have mainly to be on their guard against the use of materials and methods of rigid connection. Every trade of building is exposed to the disastrous effects of moisture and frost. In cement and plaster work the havoc caused by water may be most injurious to masonry and plastering, but the effects of swelling and shrinkage in joinery, for example, are often of a very serious nature. A joiner may be very careful and minute in his fitting and joints, and yet his labour may be all useless if the deals are unseasoned, or the wood is allowed to become saturated by moisture in the walls and plaster. The fault is with those who hurry the building, and allow the joinery to be fixed and floors laid before the carcase is properly fit to receive them. One authority says that a building should be erected and covered at least nine months before the joiner's work is fixed; but we know that this rule is transgressed. The floors, doors, skirtings, and other fittings are sent directly the roof is on, and before the walls have evaporated their moisture. Directly the fires are lighted the joints open, the panels of doors and framing crack, or are drawn out of the grooves, the mitred shoulders of architraves open, the floor boards leave wide joints, and the doors and sashes of windows shrink to an extent that renders them useless for excluding draughts and rain, to say nothing about the continual rattling of sashes on windy days. The architect and joiner have much to learn in the modes of conversion of timber. It has been acknowledged on the best of authority that the most judicious mode of cutting is to observe the medullary rays to insure freedom from twisting or shrinking. The timber should, in fact, be cut in the direction of these rays, as being the natural plane of cleavage of the wood, and that followed by earlier carpenters in riving. Mr. Stevenson refers to this method of conversion as the easiest and best, and the one that minimises the effects of shrinkage. The old panellings of mediæval times were, as he says, made of riven boards. The effects of shrinkage can be allowed for by groovings, rebates, and the avoiding of wide panels and boards.

We have the means of allowing for expansion in the details of iron construction, but do we use them? They are seldom adopted, except in large roofs and floors. Rigid connections even in a small span iron roof may set up destructive forces which tend to tear the buildings, as we find in iron joists fixed to brick walls, which are continually drawn together or pushed apart at every change of temperature. Indeed, the whole question of combining and connecting is a neglected branch of construction. The homogeneous concrete iron floor is open to this objection, as concrete is known to be much affected by temperature, due to the ingredients of which it is composed. Cement is another material which the builder uses without considering its nature. A wall of brick and cement will show cracks caused by contraction, and it is known that a long coping set in cement will push out the stones at the end. Again, the cracks of a wall will often be found to close in damp weather, and open in dry, cold weather. All these instances show the mistake of rigidly connecting the stones or bricks by a material which is subject to the law of expansion. The instances we have given are enough to indicate the all-important question we have raised. Every material which enters into a structure—even the soil on which it stands—is subject to forces and reactions, external and internal; some dependent on moisture, heat, and cold; some on mechanical agencies, arising from the law of gravity; others on chemical changes and affinities; and it is further evident that those buildings which are most complex, and therefore heterogeneous in the nature of their materials, are those which, in the course of years, suffer most from them.

◆

THE STABILITY OF DOMESTIC CHIMNEYS.

IN the design of buildings, as in all structures of masonry, the relation of thickness to height is a very important matter. The architect designs largely by the eye. The visible quantities as expressed in his elevation and section are generally sufficient to enable him to dispense with those delicate computations of stability which the engineer so frequently calls to his assistance. The proportions of a well-designed structure give a full margin to stability, as they also satisfy the eye, which intuitively exacts a certain relation between height and width. Many of the proportions of brick buildings are regulated by bond, that is, the number of bricks and half-bricks. In the framing of the Building Acts the thickness of walls is thus regulated in the schedules. These thicknesses are sufficient for party-walls, which mainly sustain a vertical weight; but in the construction of chimney-stacks there is no clear rule. Under the 18 and 19 Vict. cap. 122, section 20, it is enacted that: "Every chimney-shaft shall be carried up in brick or stone-work all round, at the least 4in. thick, to a height of not less than 3ft. above the roof, flat, or gutter adjoining thereto, measured at the highest point in the line of junction with such roof, flat, or gutter"; but it goes on to give the maximum height, which is that it shall "not be built higher above the roof, flat, or gutter adjoining thereto, measured from the highest point in the line of junction of such roof, flat, or gutter than a height equal to six times the least width of such chimney-shaft at the level of such highest point in the line of junction, unless such chimney-shaft is built with and bonded to another chimney-shaft not in the same line with the first, or otherwise rendered secure." This regulation applies to the Metropolis. The proportion thus given as a maximum height is safe under ordinary circumstances, and in positions where the full force of the wind is not experienced; but it is rather too much in situations exposed to high winds or hurricanes, such as that which visited these shores a week or two since, and which blew down numerous stacks on houses. When we take into account the age and decayed nature of some bricks, the perishable mortar used in the joints of the stack, each of which conditions considerably reduces the margin of safety, we shall have no difficulty in coming to the conclusion that a large number of chimney stacks are in a very risky state, and that sudden gusts of wind render them exceedingly dangerous to the inmates, and also to persons who happen to be near the buildings. The only rule to insure stability is to take moments about the centre of gravity of the shaft where the wind-pressure acts. The stability of a chimney stack of course depends on the weight of the brickwork above the joint at the base, being such that it preponderates over the wind-pressure at the centre of gravity of shaft, to such a degree that the resultant of the two forces shall fall within the base of stack at the said joint sufficiently to prevent crushing of the material on that side, or tension on the opposite or windward edge. For the sake of stability, the line of pressure or resultant of the weight and wind pressure should fall within the shaft thickness at the joint level by at least one-quarter of the whole width of chimney. If we suppose an ordinary brick stack composed of 9in. flues and $4\frac{1}{2}$in. of brickwork on each side, the total width of stack would be 18in., so that the line of pressure should come within the joint by at least $4\frac{1}{2}$in. The height of the chimney above the joint would be 9ft. if the maximum statutory limit is allowed; and if we say there are five flues in width, the stack would be 6ft. wide. It is easy to find the weight of the brickwork above the level of joint, which may roughly be put at 80cwt. Then, if we multiply 9ft. by 6ft. and by the wind pressure, we shall obtain the total force which acts against the side of the chimney at its centre of gravity, and this force has to be counteracted by the 80cwt. acting through the centre of the chimney's thickness. There are thus three external forces acting upon the stack exposed to the wind: the weight of chimney acting vertically, the wind-pressure acting horizontally, and the reaction of the resultant. By taking moments about the centre of gravity, and assigning definite values to each force, the actual stability of the chimney can be found. It will be found from this investigation that chimneys of this height scarcely fulfil the conditions of stability, especially when the tenacity of the mortar at the joint is small or impaired by age. Of course the tenacious property of the mortar has something to do with the question, as good mortar would increase the resistance to its overturning, but little dependence can be placed on this alone, as it would be extremely unwise to trust to the tenacity of a joint.

We frequently see chimneys which rise from the eaves level to a height of 10ft. or 12ft. above at the side of a house slightly inclined, partly by the action of the sun and moisture. These ought to be thicker or buttressed. Iron stays are abominations, and should not be tolerated. We think the only proper means of strengthening chimney stacks of this height is to give them more base—to add, in fact, piers or half-brick projections between the flues on each side. The subject is one that demands attention from the London County Council, and from all local authorities who have the administration of building by-laws. Several fatal accidents from falls of chimney stacks have been reported lately which call for some attention on the part of officials.

NONCONFORMIST CHURCH BUILDING.*

By JAMES CUBITT.

CHAPTER III. (*continued*).

6.—VENTILATION.

WHILE a church only needs to be warmed for half the year, or less, it needs to be ventilated at all seasons; and when there is least need of warming there is most need of ventilation. The commonest system, known as natural ventilation, depends on the difference of temperature between the inside and outside air. In cold weather, fresh air is ready to rush in at every crevice. All that is wanted then is to confine its entrance to the proper places, and afterwards to keep it under control. But on hot days—when it is most wanted—the supply of fresh air on this plan runs short, or ceases entirely. The outer air is drawn in only when it is colder than the air inside the building. When it is much colder it is drawn in rapidly. When it is only a little colder, it is drawn in slowly; and when it is no colder, it is not drawn in at all. Now there are many days in a hot summer when the interior of a large building is actually cooler than the outer air; and at such times all systems of unassisted natural ventilation fail to act properly.

Ventilation by mechanical pressure, or by mechanical suction, on the other hand, is trustworthy, but expensive. Fresh air, warmed or cooled according to the season, is forced in from outside. The exhausted air is sucked out through ventilating trunks, by means of revolving fans or similar contrivances. On such a system the entrance and exit of the air no longer depend on the excess of the inside over the outside temperature. The circulation goes on whether in winter or summer, as long as the machinery works. The drawback is the cost of working it. A gas-engine, or in very large buildings, two or three gas-engines, are required, unless water-power is made use of, and this, except on a very small scale, is not much cheaper than gas. Hence, ventilation by mechanical power is generally too costly for use in Nonconformist churches.

A comparatively inexpensive compromise between the two systems is frequently resorted to. This consists in aiding the exit ventilation in some one of several ways. One way is to take advantage of the wind outside the building, and thus to obtain an up-current in the extracting shaft. Both revolving ventilators and fixed ones have been designed on this principle, and have been largely used. If a high wind were constantly blowing, no doubt a constant up-draught, though a feeble one compared with the force of the wind, would in this way be kept up. But high winds, fortunately, are by no means incessant, and perfectly calm days are common enough. Now, on a calm, sultry day in summer, just when an up-draught is most wanted, this system absolutely fails to produce it. And on a calm, frosty day in winter, not only does the up-draught cease, but the cold air creeps past the ventilator, and descends as a powerful down-draught. The force of the wind might undoubtedly be turned to good account in assisting ventilation. But to do this effectually, the force would have to be stored. The ordinary hand-to-mouth plan of getting an up-draught just while the wind blows, and perhaps a cutting down-draught when it ceases to blow, is too crude, too primitive to hold its ground when ventilation comes to be taken up as a serious matter.

An up-current in the extracting shaft, produced by heat, is much more regular and reliable. A sufficiently powerful coil of high-pressure hot-water pipes, forms, where it can be introduced, a very convenient way of applying the heat. In other cases a gas-stove, or a ring of gas-jets, will answer the same purpose. The extracting shaft, again, if formed of sheet-iron, may be carried up inside the boiler-flue, the heat of which, passing through the iron, will produce a considerable up-current with little need for care or attention. If this last plan is adopted, it must be remembered that exit ventilation will be needed at times when the heating apparatus is not required. Means must, therefore, be provided, such as the addition of a separate fireplace for use in summer only, by which this flue can at all times be kept hot.

If no artificial assistance is given to the outgoing current of air, then its stoppage in very hot weather must be counted on and provided for. In such a case a considerable part of the windows should be made to open, and should especially be set open between the services. The congregation will then, on each occasion, enter a building filled with fresh air, and not with already vitiated air, and even if the ventilation during the time of service does not go on quite so rapidly as it should do, its faults during a period no longer than an hour or two will hardly become very serious. There are great differences between writers on this subject with regard to the quantity of air which each occupant of a building needs. Some of them taking as a basis the capacity of the human lungs, and the average rate of breathing, have decided that 3c.ft. per minute, or 180c.ft. per hour, ought to be enough. Others, instead of simply calculating what *ought* to be enough, have tried by experiment to ascertain what really *is* enough—how much fresh air, that is, actually needs to be supplied in order to keep the atmosphere inside a building from becoming perceptibly tainted and impure. These authorities, who are by far the more trustworthy, also differ much among themselves; but they agree in making far higher demands than the merely theoretical writers. Instead of 180c.ft. per hour, they ask for something like 900ft. in the case of every child in a school, and they consider about 1,400ft. necessary for each adult in concert-halls and similar buildings.

A current of air moving at a greater velocity than about 3ft. per second is felt, by persons who are sensitive to such things, as a draught. If, therefore, the air is liable to come in faster than this, it should be prevented from blowing directly upon the congregation. This is easily managed by causing it to enter through vertical inlet shafts of sufficient size, open at top, and fixed against the inside of the walls. Of this kind are the so-called Tobin ventilators. They are generally used too small, and are often made needlessly ugly; but when properly treated, they are useful as being the simplest possible contrivance for turning a horizontal inrush of air into a vertical one. Care must of course be taken that there are no projections above the openings of these inlet shafts, on which the vertical currents may strike and be deflected downwards. If wire net is fixed over these shafts as a guard, it should have openings at least ½in. square, and should by no means be put across the top of the opening; if it is, it will cause the air current to spread out sideways instead of going upwards. It should, therefore, be placed a foot or more down the inside of the air shaft.

---

* All rights reserved.

In cold, or even moderately cold, weather, it is a great improvement to warm the air which enters by these upright shafts. The common type of Tobin ventilator, however, is too narrow to let this be done in what is generally the most convenient way—that is, by radiators, or coils of hot-water pipe. And again, where some degree of perfection is aimed at, the pipes which heat the incoming air should be capable of being used apart from the general heating apparatus. They should belong, in short, to the draught-preventing system before spoken of. Where the air is to be warmed in this way, the inlet ventilators should be wide enough to contain a large quantity of hot-water piping. The air should be admitted in such a way that it is compelled to pass through the piping before it enters the church. And as the quantity of air which will come in from the outside varies enormously with the temperature, valves or air-sluices of simple construction will be needed to regulate it. Warmed air may be admitted near the floor level; but it is better for cold air to enter at a height of 5ft. or 6ft.

With regard to exit ventilation, or the extraction of exhausted air, two or three points remain to be noticed. The arrangement by which air is extracted generally consists of an upright shaft, opening outwards at top, and one or more air trunks, leading from the various ventilating apertures in the ceilings or roofs, and connected with the bottom of the upright shaft. This shaft may be treated as a chimney, a flue, or a ventilating turret, and the higher it is, the greater will the up-draught be. The ventilating apertures for extracting foul air should be placed near the highest points of the ceilings. They will be required not only in the central part of the building, but also in the ceilings below the galleries, if the latter are of any considerable size. The extracting air-trunks are of metal, or of wood, planed smooth inside, and tongued together so as to be practically air-tight. They should not be placed horizontally, but should slope upwards in every part towards the upright shaft. The means of producing, or assisting, an upright current in this shaft have already been noted. If a gas stove, or a ring of gas jets is employed, a short funnel fixed above them, with its base fixed air-tight to the shaft, and its top opening into it, will help to prevent any accidental descent of cold air from the top. It is, in fact, of the very greatest importance that every part of the extracting system should be fitted together with air-tight joints, so that there is no leakage into, or from, the surrounding atmosphere at any point between the ventilating apertures in the ceilings at bottom, and the free outlet at the top of the upright shaft. Any such leakage will not only stop the up-draught, but will, in all probability, lead to cold down-draughts also.

On the whole, ventilation is a thing that needs more care in arranging, and more intelligence in working, than it usually gets; and the first step towards its improvement is to get rid of the idea, which is as common as it is baseless, that there is, or ever is likely to be, any system of ventilation which, once adopted, will manage itself with no need for attention, in all seasons and at all temperatures.

◆

THE ACTION OF HEAT FROM OPEN FIREGRATES, STOVES, AND HOT-WATER PIPES.—I.

By F. DYE.

THOSE who make a profession of hot-water works, or heating by hot air or by stoves, almost invariably make it a point to deprecate the use of open grates, and to show that with these articles very irregular results are the general rule, and for a given amount of heat they are not very economical in fuel. On the other hand, the maker of the open firegrate can claim advantages for his manufactures which the other methods of heating do not possess, and he can just as readily deprecate these other methods in question, owing to their having disadvantages which are absent when the open grate is used.

Speaking as favourably of the open grate as possible, it has to be admitted that, with the average of those that are now in use, the heat evolved is very irregular indeed, and even with careful stoking the effect, by way of heat distributed into the room, for a given quantity of fuel, is less than with either of the other methods referred to. Let it be clearly understood, however, that this last paragraph is intended to apply to the average grate now in use, as quite the majority consist of what are commonly termed "registers," having a register flap at back, and no provision to reduce the speed of combustion. This is an old-pattern grate, and is very greatly improved upon by many new grates, more lately introduced, and which will be alluded to directly as they more nearly approach perfection. These latter, however, are not yet in the majority by any means.

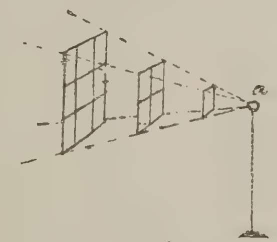

FIG. 1.

From this it will be gathered that the heat evolved from open grates is different in action and results to that obtained from stoves and water pipes, and requires to be treated distinctly in these papers. In the same way the two methods usually form two distinct trades or callings, and the one deprecates the other as a rule, as just mentioned.

The mode by which heat is transmitted from the fire of an open grate to the persons or objects in a room is termed "radiation." Now, radiant heat acts in a manner peculiar to itself, firstly in sending its rays in direct lines from the source of the heat, and anything that does not come within the area or focus that the rays cover will not get heated by them, and would remain quite cold were it not that other indirect agencies cause the radiated heat to ultimately raise their temperature. The rays or lines of heat from the glowing fuel travel, as just stated, in direct lines from this source; but they diverge, or spread out, somewhat as they get away. The exact sum of their divergence is stated as follows:—"The amount of radiant heat received by a given surface varies in the same proportion or ratio as the inverse of the square of the distance from the source of heat."

Fig. 1 illustrates and makes this technical rendering clear (*a* being the source of heat). It will be seen by this figure that as the rays of heat get further and further from their source they become more distributed as to the area they act upon, and a moment's thought will show that as they thus widen out they lose in power or intensity, and this is why it is that as we get further and further away from a fire the heat gets less and less. It is nothing else, for even if the fire were outdoors and the air in motion, it must not be thought that air or wind would make any difference to the direct course of radiant rays of heat. As an instance, to show that these rays travel in such distinctly direct lines, let anyone place a screen between them and the fire, and see how instantly the heat is cut off. The same with a sunshade and the sun's rays. The heat does not curl round the edge of these screens and strike the person who is shielded behind them, for it will be found that the shadow cast by a sunshade is wanting in heat, the same as it is wanting in light.

Now when radiant rays of heat (more frequently called radiant energy, for heat has been found to be nothing more or less than motion) strike or impinge upon an object, the temperature of this object is raised; it is made warmer, more or less, as it is capable of quickly or slowly absorbing heat. When it has received heat it at once commences to re-radiate, to redistribute it by radiation. This second radiation of heat is not so strong as the first from the fire, but is none the less certain, and it travels in the same direct lines. The lines of heat may, however, in this case proceed to some part of a room where the primary rays do not reach, and here they go to warm other objects, which in their turn distribute the heat again in different directions, and so it goes on. We might say the heat is tossed from one article to another about the room and so distributed; but this process goes on rather slowly, and when a fire is first lighted in a room, it is some time after the direct radiant heat is felt before the parts that do not receive these first, and more powerful, rays are warm. This re-radiation of heat is one of the causes of the distant and remote parts of a room becoming ultimately warm.

If the direct rays of heat from a fire encounter a polished surface, there is instantly an active dispersal or deflection of the warmth. The action is essentially the same as with a ray of light that encounters a polished object. By an arrangement of mirrors, or such surfaces, it would be possible to divert the heat as desired; but this arrangement is neither practical nor probable.

Another, and most active, source of heat diffusion is the action of "convection." The word diffusion is correct here, as the way in which convected heat acts, has no straight lines, or such rules governing it, but causes the heat to transfer itself here, there, and everywhere, in a rapid, and effective, and independent manner.

"Convection" is derived from the word *conveho*, to carry up, and is the act of conveying heat by the ascent of heated particles of air or liquids. It is this action that we depend upon in a hot-water apparatus, and without it we could have no circulation of water. It acts in the same manner with air, only more rapidly. The action of convection is as follows: The air, or atmosphere, is composed (like water) of an innumerable quantity of minute particles or molecules, these minute particles all being quite distinct and independent of one another, and, furthermore, being wholly devoid of friction or resistance of this kind in their movements. In all solid substances we look for friction to manifest itself more or less according to the surface of the particles of the substance; for instance, if we piled up jagged pieces of stone, we could make the heap a considerable height, owing to the friction brought to bear by the rough shape of the pieces preventing their slipping. If we attempted to make a heap with, say, billiard balls, we should not get along so well; but, to give an idea what absence of friction there is amongst the particles of liquids and gases, let anyone try and make a heap of water.

Most authorities agree that there is not only absence of friction amongst fluids (liquids and gases) but also a positive repelling influence, for it is found in exhausting the receiver of an air-pump that although the air gets more and more diminished as the pumping is continued; yet, when the quantity is very reduced, it still pervades the whole of the space, though in an attenuated form. What remains in the receiver does not collect in one spot; but the particles spread themselves about, getting as far apart from one another as possible, it would seem, and this phenomenon is just as noticeable when the air left in the glass is only about $\frac{1}{10,000}$ its original contents.

Having shown that air is composed of exceedingly small particles, ready to move freely in any direction that they may be impelled, the actual process of convection can be explained as follows: When air comes in contact with a heated object, those particles which have contact become heated also (for air absorbs heat readily), but directly the particles increase in temperature they also increase in size; they expand with heat, like every other substance, solid or fluid, does. Now, when a substance or particle is increased in bulk without increase in weight, it is rendered lighter than its smaller fellows. If we had a piece of cork 2in. square, and a piece of wood 1in. square, both weighing exactly the same, we should call the cork the lighter material owing to its having greater bulk for a given weight. The particles of air, therefore, that are warmed and rendered lighter than their fellows, are instantly displaced and caused to rise up by the superior weight of the latter, and as the new cold particles come in contact with the heated object, so they are warmed and lightened, and cause the rise also.

Fig. 2 illustrates a heated ball, and the arrows indicate the action of the air as the particles touch and are carried up in the way explained. The action is so rapid that there will be a constant stream of cool air to the ball, and an equally constant stream of hot air rising from it so long as it remains heated. If any heated object is taken, and some cigar-smoke gently blown upon it, it will be seen how quickly the smoke takes an accelerated upward direction when it comes over the source of heat; the heated up-current of air carries it with it. This is rather a long explanation devoted to convection, but it is a subject little known, or, at any rate, less known than its kindred subject—radiation. In stove and hot-water works the subject of convection is all important, as will be seen directly.

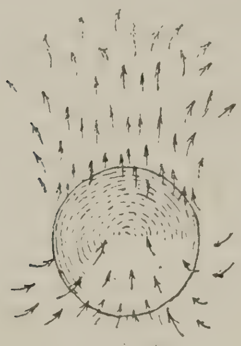

FIG. 2.

It will now be understood that air coming in contact with furniture and objects in the room which have received warmth by radiated heat, instantly sets up convection currents, and this transfers heat to the distant or obscure parts of the room just as readily as the re-radiation explained, if not more so in some cases. These convection currents also bring fresh air for respiration, and Nature has provided many things which induce these currents of air to our benefit. There is a circulating motion of air induced by everything that has warmth—even the human body itself. If a cold object were introduced into a hot room this also would induce the action explained, but the movement would be reversed. The warm-air particles would be contracted by contact, and they would fall—just the opposite to the explanation given, but just as certain and rapid. The next paper will deal with the advantageous and special features of the open grate.

◆

PROSCENIUM CURTAINS.

IN a paper on theatres and music halls, published in the *Building and Engineering Journal* of Melbourne, Mr. Ernest Woodrow describes the various curtains before the public as: (1) Single wrought-iron plates, and wrought-iron plates fixed on a frame, with an air-space between. (2) Wrought-iron plates and wire-gauze combined. (3) Asbestos cloth in various forms. (4) Canvas curtains with water-spray. (5) Water-spray curtain. Referring to each of these the author says: What is required is a fire-resisting surface not affected by the great heat of a fire on the stage, which will prevent the passage of flame and smoke into the auditorium; a surface not affected by water thrown upon it when it is heated, a surface sufficiently rigid in itself to resist falling timber, &c., upon it, and one that shall not be too heavy to be raised and lowered. Iron plate curtains buckle and twist, allowing flame and smoke to pass, they convey heat, and are heavy; wire gauze does not withstand falling bodies, and smoke and flame will pass through it if damaged; asbestos is fragile, and becomes easily torn; water and canvas depend altogether upon the water being spread over them; water-spray will not stop the passage of flame and smoke. Mr. Max Clarke has invented a *protected* iron curtain which is said to fulfil these conditions. It is an open framework of iron and wire, protected by a covering of silicate cotton and slag-wool on each side. This cotton is covered with wire netting, and forms an absolutely non-conducting material, and can be covered on the auditorium side with green baize, to look like a green curtain, or have painted canvas, and take the place of the "act drop." This curtain is pliable, and will adapt itself to any strain, is fire and smoke proof, and can be raised by man or hydraulic power.

◆

HYDRAULIC AND SANITARY APPLIANCES.

THE catalogue issued by Messrs. Charles Winn and Co., of St. Thomas Works, Birmingham, and 41, Holborn Viaduct, is replete with illustrations, descriptions, and prices of plumbers' goods, all of which are reliable and in everyday use. The patent "Acme" siphon cistern made by this firm, of which over three thousand are in use in Noel Park, on the Estate of the Artisans', Labourers', and General Dwellings Company, is a very perfect cistern, and has given much satisfaction for its working capabilities. and the testimonials appended from the deputy chairman are conclusive. The "New River cistern" has also been largely used; it has the top of the siphon above the top of cistern, as required by some of the water companies. Both cisterns give a rapid flush, and their simplicity and avoidance of valves, leathers, &c., which get out of order, are important. The price in strong cast-iron, painted, with chain and handle, is only 20s. Several valve closets are illustrated. We notice "Winn's improved elastic-seated valve closet," an apparatus for first-class dwellings, highly approved by architects for the depth of water in basin and cleanliness of action. The inlets are straight, and the water divides and flushes each side of basin, and has a strong scouring action at the back. The price—from £2 15s. to £4 13s.—is very moderate for best quality closets. Winn's household closets for use with their siphon cistern of different types are shown; 291 B is specially recommended by Dr. Hill, medical officer for Birmingham. The backs are made straight, so as to prevent soiling. These basins and traps are made in one and two pieces, and are self-cleansing. These closets are known as the "Trent" and "Severn," and are made with raised ornament in the pedestal form. Winn's patent Granville closet is another capital pattern for cleanliness and outlet. Various fittings, flushing cisterns and slop-closets, sinks of improved make in cast iron, glazed porcelain, and stoneware; traps and bends, soil-pipe ventilators, baths and fittings, lavatories, we note. Winn's patent "Washington" urinals of all forms, stop-cocks, beer machines, are catalogued and illustrated. The patterns of pumps for different uses are very complete. We must specially notice the screwing machines with adjustable dies for wrought-iron tubes—a powerful machine which will grip 2in. tube as firmly as ¼in. without injury, and fitted with a capital screwing arrangement for size of tube and threads. These are well known, and are largely used. Winn's "improved portable screwing machine," Nos. 6,191, 6,196, 1,025 are noteworthy. One merit of this catalogue is that it is so arranged that a plumber will find on adjacent pages what he requires in connection with another class; the illustrations, descriptive matter, and prices, all consecutively arranged so that all relating to one class of goods or appliance can be readily referred to.

PRICES.—XXVIII.*

◆

CHIPS.

A high tower will, it goes without saying, be one of the features of the Chicago Exhibition. It will be 1,150ft. in height, will contain 6,000 tons of steel, and has been designed by Mr. George S. Morison, of New York and Chicago, who, unlike many engineers of such erections, has not slavishly followed M. Eiffel's ideas.

The contract for the erection of the Leeds new post-office, the site for which was purchased from the corporation for £54,000, has been let to Messrs. Thomas Obank and Sons, of Idle, near Leeds, for £58,200.

Mr. Francis Adams, formerly of the Office of Woods and Forests, and for more than 40 years clerk to the Crown Estate Commissioners, died on the 5th inst. at his residence, Holmfield, Surbiton, aged 70 years.

The deliveries of Portmadoc slates for the last year amount to 133,145 tons, against 117,754 tons in the previous year. Owing to several quarries having discontinued working from exhaustion of rock or other causes, the production has been considerably less, and it is estimated that stocks have been reduced by full 20,000 tons. The prospects of the slate trade are brighter than for many years past, as the production cannot be daily increased, and consumption has evidently overtaken supply.

ILLUSTRATIONS.

MAGDALEN TOWER, OXFORD.—A DECORATIVE ALPHABET IN THE RENAISSANCE STYLE.—SECOND PREMIATED DESIGN FOR THE NEW COURTHOUSE AT CORK.—ST. AUSTELL LIBERAL CLUB. — "RALSTON," BROMLEY, KENT. — HIGHER GRADE SCHOOLS AND TECHNICAL SCHOOLS, BATLEY.

Our Illustrations.

THE MAGDALEN TOWER, OXFORD.

OUR illustration is from an original pen-and-ink drawing (12in. by 20in.) by Mr. Claude de Neuville, which attracted considerable notice at Mr. Mendoza's recent exhibition of black and white. It represents the tower as seen from the bend on the north side of Magdalen Bridge—one of the best places to judge of the beauty of its proportions. It was built 1492-1505, and is about 145ft. high. It is not of one size all the way up. The decrease may be stated at from 4in. to 6in. just above the base or plinth, 3in. to 4in. at the stringcourse just below the large windows of the belfry, and 2in. or 3in. at a course half-way up the same. The upper portion (belfry) was thoroughly restored, and a new statue of St. Mary Magdalen by Mr. Conrad Dressler substituted under the direction of Mr. E. P. Warren, during last summer. This new feature is shown in the drawing. The buildings below the tower occupy the site of the former Hospital of St. John the Baptist. The bridge was erected in 1779, and was widened a few years ago under the direction of Mr. W. White, city surveyor of Oxford.

DESIGN FOR AN ALPHABET, BY JAMES WEST.

THE alphabet here shown has been designed in a style corresponding with that which was so popular in Germany in the 16th century. The letters in the original drawing are nearly 3in. high, and they are reproduced by process in any size. Mr. West does not confine himself to designs in this particular style, as a reference to the pages of any of the art magazines will show.

CORK COURTHOUSE.

SIR T. N. DEANE AND SON, of Dublin, the authors of this the second Premiated Design, say:—"As regards our plan for above, we can add very little in the way of description. We were bound to the external walls of the old courthouse, and there was little opportunity of making elevations. The back and sides were modified as regards the windows to suit our arrangement of the inside. We took some liberty in regard to the architecture of the inside, in the entrance hall, courts, and grand-jury rooms. These were treated in a Free Italian style. The building would have cost fully £20,000 to carry out. The joint-committee of the county, grand jury, and the city were rather of opinion that they could rebuild for £15,000, which was quite too little. Mr. Thomas Drew, who acted as assessor, was of opinion that our plan was *a tie* with Mr. Hill's plan." Mr. Hill's design was awarded the first place, and we illustrated his drawings in the BUILDING NEWS for Dec. 25 last.

ST. AUSTELL LIBERAL CLUB.

THIS building has been lately erected by Mr. Francis Barratt, C.C., of 39, Lennox-gardens, London, for the Liberals of St. Austell, for which district Mr. Barratt sits in the Cornwall county council. It was opened by the Right Hon. Sir George O. Trevelyan, Bart., M.P., and comprises on the ground-floor two good-sized shops and club entrance. On the first floor a reading-room, 29ft. 6in. by 22ft., a smoking room 22ft. by 16ft. 6in., which are so arranged that they may be thrown into one for political gatherings. A library 13ft. by 12ft., and a kitchen 17ft. 6in. by 11ft. 6in. On the second floor is an open-timbered roof billiard room, measuring 46ft. by 22ft. with two tables, a secretary's room, and the necessary cloak-rooms, lavatories, &c., the whole being approached by a spacious staircase with carved newels and balusters. The building is lighted throughout by electricity, and everything necessary has been done to render the appointments complete. The architect is Mr. Silvanus Trevail, C.C., of Truro, and the contractors are Messrs. Smith and Jacob, of St. Austell.

"RALSTON," BROMLEY, KENT.

THIS house has been lately finished, from the designs and under the superintendence of Mr. Evelyn Hellicar. The walls to about the height of the first floor are faced with red bricks; above the walls are hung with weather tiles of a good red colour, the same being used to cover the roof. The ground-floor accommodation will be seen by the plan. The first floor contains five bedrooms, dining-room, ballroom, &c. The work has been satisfactorily carried out by Mr. T. Crossley, of Bromley. The illustration is from a drawing shown in last year's Royal Academy.

HIGHER GRADE SCHOOLS, BATLEY.

THE perspective view is as submitted in the competition, and shows the boys' and girls' departments, although the girls' portion is being first erected. Also it has been arranged, since the competition, to have two additional class-rooms in each department, which are shown on the plan. The site is in one of the best positions, and from which there is an extensive view of the town and surrounding country, being on the slope or hill side. The lower or basement portion has been utilised for covered playgrounds, cooking class-rooms, heating-chambers, store-rooms, &c. The principal floor contains the vestibules, which are recessed, passages in each department distinct for the children and adult entrance to galleries, central hall, class-rooms, cloak-rooms, masters' and mistress's room. Internal staircases are provided for access to the covered playgrounds below. On the first floor are extensive galleries, from which access is had to class-rooms well lighted by side lights and ornamental dormer lights (not shown on the drawing). These are intended for music and drawing. The materials are of the very best description throughout without extensive elaboration. Outer walls of Yorkshire Delph stone. The covered playgrounds are also lined with stone. All dadoes, entrances, &c., are of American oak, and the cloak-rooms and lavatories have marble mosaic floors, majolica-tiled dadoes, strings, and bases 4ft. high. The lavatories, supporting walls, &c., are of cream glazed, solid earthenware. Especial and novel means have been designed for the heating and ventilation, so that a change of atmosphere may be obtained constantly at three different levels. The central hall is lighted from all sides; the ceilings of class-rooms being flat, and formed with steel joists imbedded in concrete, and covered with the Seyssel Mineral Asphalte. Doors are provided for access to these flats for cleaning windows or any other purpose that may arise. The total cost of both departments will be about £8,000, the first portion being well advanced, the corner-stone being laid about a month since by Mr. Geo. Hirst, chairman of the school board, on which occasion he was presented by a handsome silver trowel, and a mallet of African blackwood, elaborately turned and ornamented, the handiwork of the architect Mr. Harry B. Buckley, 8, East Parade, Leeds.

TECHNICAL SCHOOL, BATLEY.

THIS perspective view, as submitted in competition, shows the full scheme for the subjects to be taught, which are principally:—Chemistry, weaving and designing, dyeing, applied mechanics, mining engineering, building construction, health and sanitation, drawing, book-keeping, shorthand, modern languages, botany, &c. There are also rooms for the caretaker, head master's room, secretary's office, governor's room, closets, cloak-rooms, lavatories, w.c.'s, &c. The lecture-hall is 44ft. by 32ft. with gallery, for 100 students, and will have a completely fitted lecturer's table, with large sliding blackboards, diagram, screen, &c., also a preparation-room at the back 40ft. by 9ft. fitted with work bench, tables, &c., with large opening communicating with lecture-hall as usual, for the passing of apparatus, &c. Tenders will be invited in due course for the various works. Mr. H. B. Buckley, of 8, East Parade, Leeds, is the architect.

COMPETITIONS.

HARROGATE.—In a limited competition for new Wesleyan chapel and schools, Grove-road, Harrogate, the designs submitted by Messrs. Morley and Woodhouse, architects, of Bradford, have been adopted.

CHIPS.

The Leamington Town Council decided on Monday, by 16 votes to 10, to open the free reading-rooms and reference library from 2 to 6.30 on Sundays during the winter months.

In the case of Arthur Gerrard, of Liverpool-road, N., builder, the order of discharge in bankruptcy has been suspended by the registrar for four years, from July 23, 1891.

Messrs. Hovenden and Berridge, of Bishopsgate-street Without, E.C., surveyors, have dissolved partnership.

Just before evening service commenced in Holy Trinity Church, Harrow-green, Leyton, on Sunday, a fire broke out in the vestry, which was not subdued until the chancel had been gutted.

At the last meeting of the town council of Rochdale, it was agreed to expend £60,000 on extensions at the gasworks, including a new gasholder 150ft. in diameter and 100ft. high, and tank, retort house, retort stack, coal stores, and new approach road.

On Saturday afternoon the restored monument to Queen Eleanor in Lincoln Cathedral was unveiled by the High Sheriff of Lincolnshire, Mr. Joseph Ruston, at whose cost the restoration has been carried out. In character it is a marble altar monument, with a life-size effigy of brass and copper, fully gilt, and having on the edge an inscription in brass. Queen Eleanor died at Harby, near Lincoln, on November 28, 1290, and her body was taken to Lincoln and embalmed.

On the Feast of the Epiphany, in St. James's church, Exeter, was unveiled a reredos, in oak, divided into five panels, each surmounted by crocketed canopies, and numerous pinnacles springing therefrom. Over the central canopy is an octagonal, crocketed pinnacle, rising to the height of 16ft. The design was from the office of Messrs. Tait and Harvey, the Close, Exeter, and the carving was executed by Mr. E. T. Rogers, Sidwell-street, Exeter.

The Belfast Corporation have increased the salary of Mr. J. C. Bretland, M.Inst.C.E., city surveyor, to £800 per annum; that of Mr. Jas. Munce, Assoc.M.Inst.C.E., Mem.San.Inst., the assistant city surveyor, to £350 per annum; and that of Mr. G. A. Boyd, third assistant and inspector of buildings, to £150 per annum.

Mr. Edward Tidman, F.S.I., M.S.A., of Westminster, has just been appointed by the Technical Education Committee of the Essex County Council, lecturer on "Hygiene," and will shortly commence a course of lectures under their auspices.

The Langdale School, near Ambleside, is being warmed and ventilated by means of Shorland's patent Manchester stoves and exhaust roof ventilators, the same being supplied by Mr. E. H. Shorland, of Manchester.

M. Charles Louis Muller, an historical painter, died on Saturday at the age of 76. He studied under Gros and Leon Cogniet, and began exhibiting in 1837. His best-known work is the "Appel des Condamnés sous la Terreur," one of the largest pictures at the Luxembourg.

Three painters will be elected as Associates at the meeting of the Royal Academicians next week but one. The men most likely for election are said to be Stanhope Forbes, J. M. Swan, Albert Moore, or M. Lawson.

The county council have adopted plans by Mr. James Wilson, M.Inst.C.E., of Greenock, for the construction of a reservoir near Inellan.

In the competition for plans for the sewerage of Eastleigh (late Bishopstoke), Hants, the rural sanitary authority of South Stokeham have adopted the scheme submitted under the motto "Health and Economy." The estimated cost is between £9,000 and £10,000.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations*, and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances*, under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance*, as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names. We cannot keep the list open long, so those desirous of being included should *send in their instructions at once*, as when the allotted space is full no more names will be received this year.

ARCHITECTURAL DESIGNERS—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

ARCHITECTURAL PHOTOGRAPHERS—
Bedford, Lemere, and Co., 147, Strand, London, W.C.

ARCHITECTURAL TERRACOTTA—

TECHNICAL SCHOOL, BATLEY.—Mr. H. B. BUCKLEY, *Architect.*

WAYSIDE NOTES.

THE Benedictine Abbey at Fécamp was, prior to the great fire on Tuesday last, one of the most interesting and architecturally beautiful of the ancient buildings of France. Such a reflection should cause regret to be felt for the destructive conflagration, even if there were no other point of interest; but what seems more of a blow to the Englishman was the "immense destruction of liqueur," which was announced in large type in the press. To read between these lines we see pathetic lamentation in the public heart—or stomach—at the waste of good liqueur, just, too, in mid-winter, when the mere thought of the generous fluid brings upon one a genial, after-dinner mood. What matters the destruction of the Benedictine architecture when the Benedictine liqueur has been burnt in innumerable hogsheads? The edifice "fell in with a frightful crash," which is deplorable; but how much more heart-rending the sacrifice of the bottles of liqueur stored up in the building, and audibly "exploding amid the ruins, flames of fire shooting up from the blazing alcohol." It may be said, for the consolation of lovers of "Benedictine," that, unlike the destruction of the beautiful architecture, the loss of the liqueur is reparable by dint of strenuous endeavours of the good monks of the Abbey at Fécamp, who may "make up for lost time" whenever they get a temporary roof over their heads. The epicure in liqueurs may, therefore, hope again, while the lover of old French architecture will hang his head in despair, and feel that all things temporal indeed pass away.

One generally imagines that, so far from requiring any outbreak of fire to destroy our English cathedrals, they are all pretty well destroyed already by so-called restorations, and as ancient buildings are in a *non est* state. It seems, however, that there yet remain portions of these old buildings in a goodly unrestored condition; for an architectural report made by request to the Dean and Chapter of Gloucester shows their cathedral to be in want of numerous works of reparation, and, indeed, to be in some portions in an absolutely ruinous condition. Judging from the condensed paragraphs alluding to this report, it appears that there has been some considerable neglect of even these timely repairs that all buildings require if they are not to run into premature ruin and decay. In 1886, Sir Gilbert Scott reported on the state of the cathedral, and it is stated that the recommendations therein made have been left wholly untouched, which I don't say is altogether to be regretted; and, reflecting upon the cast-iron state of the exterior of many of our once-magnificent cathedrals, it may be even said to be somewhat of a blessing to succeeding generations. Nevertheless, there can be no excuse for the neglect of *repairs*. It is really remarkable how quickly a building will fall into a quite woe-begone condition so soon as regular reparation is neglected. A shut-up and neglected house quickly shows signs of the neglect, although, strangely enough, if occupied, even if repair is neglected, it does not seem to deteriorate so rapidly. A cathedral wants repairing just as much as a warehouse or a pair of boots, and if *repairs* were not so often neglected we should not require those wholesale "restorations" which have sapped seven-eighths—without exaggeration—of the beauty of effect of our old English churches and cathedrals.

I have looked in at the rooms of the Society of Antiquaries, and had a most interesting and instructive time inspecting the fragments, relics, and models, of, discovered at, and respecting, the Roman city at Silchester. Maps, plans, and models give one a very good idea of the general aspect of the Silchester excavations. The various finds are most extensive, and much of the pottery and Samian ware of great beauty of design. What remains of an architectural character that have been discovered and are on view, tend more than ever to strengthen my old belief that true Classical architecture was something wholly different to what we—with our heads full of Palladio and Vitruvius, and semi-diameters, and modules, and discoveries of mathematical refinements in old buildings that were never intended by the old designers—are apt to imagine. The more we discover of ancient Classical architecture, the more we see that it was left for wonder-seeking and mathematico-statistical minds to crystallise proportions, and distil the "Orders" out of the remains that have come down to us at this day. Every fresh find, of old Roman architecture in particular, gives support to the very sensible theory that there was at least as much variety of composition and detail in that style as in any that came before or after it. There are in the exhibition at Burlington House two or three architectural fragments that strikingly illustrate my meaning. There are bases and arch-imposts wholly unlike the supposed conventional Classical types, and yet possessing great beauty. A friend has suggested that perhaps this work may be regarded as Romano-British rather than Roman; but I hardly think that on this score we can explain the variety of design in the details. All Roman work in Britain may be regarded as *Romano-British* in a sense.

It has always been my belief that so long as we have a grasp of the *first principles* of design we may vary all architectural forms, and yet by re-adjustment of harmonious proportions, always produce a beautiful feature. Thus, if one could properly understand the exact principles that cause, say, *an Attic base* to appear beautiful to our, and to educated, eyes, we could surely vary its proportions infinitely and always produce a pleasing effect. And it would seem to me that it was in this kind of variation that the Classical architects obtained their novelty of design, whereas we mostly in this day seek for novel effect rather by fresh combination of hackneyed forms than by varying every detail. It must be admitted that we have plenty of variation of detail, nowadays, *of its kind;* but this is generally that pernicious originality for the sake of originality which results in an architectural fiasco. A few *master-architects* among us doubtless have this grasp of their work that enables them, almost unfailingly, to produce pleasing forms; but in the 99 this faculty is wholly wanting. I submit, however, to an extent, it may be cultivated by patient study of principle.

An instrument to detect invisible flaws in metal is calculated to prove of great use in engineering and architectural works. I read of one recently invented by a French officer—Captain de Place. Small flaws are not to be detected by blows from a hammer, and consequently an instrument to effect the purpose would prevent the overlooking of slight, though, at times, no less dangerous defects in iron or steel. By a peculiar combination of a microphone and telephone, certain sounds are heard when applied to the metal to be examined, these sounds altering when a cavity or flaw exists. The instrument seems to be practically a minute reproduction of the principle of striking with a hammer. A pin in the instrument hits the metal, and the inappreciable sound it makes is made audible by the combination of microphone and telephone. Practice is required to enable the hearer to distinguish the sounds pertaining to solid and defective metal, but the faculty of perception is said to be easily required. Trials with the instrument have been made at Ermont, at the works of the Northern of France Railway Company, to find defects in rails, and the trials are reported to have been satisfacfory, defects in the metal being found where indicated by the instrument.

The London Bridge accident seems to be enveloped in some mystery, nothing at all explanatory of the cause of the unfortunate occurrence having come out at the preliminary coroner's inquest. It is to be hoped that when Major-General Hutchinson has completed his inquiries he will be able to give a complete and satisfactory explanation of the affair, and thus possibly help to avoid a third accident at this point. For a train travelling so slowly—only eight or nine miles an hour, according to the statement of Livett, the driver—the wreck was astonishing, as I saw for myself when passing the scene some hours after the accident. The carriage had the appearance of a match-box when trodden on, and seemed mixed up with the signal post, the latter apparently growing out of the ruins. It should be a point in the inquiry to ascertain how much, if anything, the bogie carriage behind, with its twelve wheels and great length of some 57ft., had to do with the cause. Off the line, bogie trucks must certainly run erratically, and in this case might have tended to overthrow the carriage preceding, and causing it to become "jammed" up in such an extraordinary way against the sharp angle of the two iron parapets at the junction. The S.E.R. seem demoralised somewhat by this accident, and ever since trains have been delayed more or less. This certainly is better than another accident; but it makes me think that, what with delays with fogs and delays without fog, I may as well hire a carriage of the company, and fit it up as a travelling office, whilst I have to spend so much time journeying backwards and forwards on the line.

GOTH.

GLOUCESTER CATHEDRAL RESTORATION.

THE Dean and Chapter of Gloucester have just issued an appeal for aid in maintaining and restoring the cathedral, and have already received promises amounting to over £2,000. They state that there is, for Gloucester Cathedral, no "fabric fund." In the five years ending Michaelmas, 1879, the dean and chapter spent out of their revenues £5,167 on the fabric; in the five years ending Michaelmas, 1890, £1,125 only; while the capitular incomes were reduced by over 50 per cent. through agricultural depression. The report by their architect, Mr. F. S. Waller, of Gloucester, states that many parts of the building may be said to be in an absolutely ruinous state—a strong assertion, it is true, and one that may appear almost incredible when taking into consideration the very large sums known to have been expended on the cathedral during the last thirty years. This, however, admits of easy explanation when we see that much work which the late Sir Gilbert Scott declared to be necessary in 1866 has been left entirely untouched, remaining in the same condition, especially as regards the roofs and parapets, as when he inspected the cathedral, excepting that the lapse of time has necessarily created still greater dilapidations. Large sums have been expended on the choir and on internal fittings, and on windows for the reception of painted glass, and the external repairs have also been very considerable, including the north and south transepts, the south porch, the nave and choir, the pinnacles and parapets of the tower, and some other portions of the building; but many more remain to be done. The most pressing of these works include the walls, windows, parapets, pinnacles, and roofs of the north and south aisles of the choir; the roof and gutters of the south aisle of the nave, and the condition of the great tower also, which, excepting the pinnacles, parapets, and chief cornice (which are in perfect condition), sadly requires pointing and general repair. Indeed, pointing alone would be the means of staying further decay, and of preserving the stonework for many years to come.

As regards the probable cost of the most pressing of these dilapidations, Mr. Waller estimates that £2,200 will be sufficient to complete all that will be required for the walls, parapets, and roofs of the choir aisles and chapels, and the worst parts of the roof of the south aisle of the nave. For the pointing and repair of the stonework of the tower, probably not less than from £1,000 to £1,500 will be required. The other roofs spoken of by Sir Gilbert Scott were estimated by him to cost upwards of £2,250. It will therefore be seen that between £5,000 and £6,000 is now required to simply repair and reinstate where necessary the most important of dilapidations, and a further £1,200 would be required for the reparation of the Lady Chapel.

St. Andrew's, Helpringham, one of the best of the Fen churches, was reopened by the Bishop of Lincoln on Tuesday week, after undergoing restoration. The restoration was brought about in consequence of the collapse of the roof of the nave last year. Much of the seating—which was new in 1873—was crushed, necessitating extensive repairs. The principal features of the present restoration are the new roofs to both chancel and nave. The work has been carried out by Messrs. Close, of Lincoln, at a cost of £1,100.

All the services at Norwich Cathedral are to be held in the nave, owing to the restoration of the three great columns which, with the fourth recently repaired, support the tower. These three columns have been in a state of dilapidation for more than half a century. The stone to be used in the work is already cut, a large staff of masons having been busily engaged under the direction of the cathedral architect. The restoration of the Ethelbert Gate, at the entrance from Tombland to the Upper Close, is now complete.

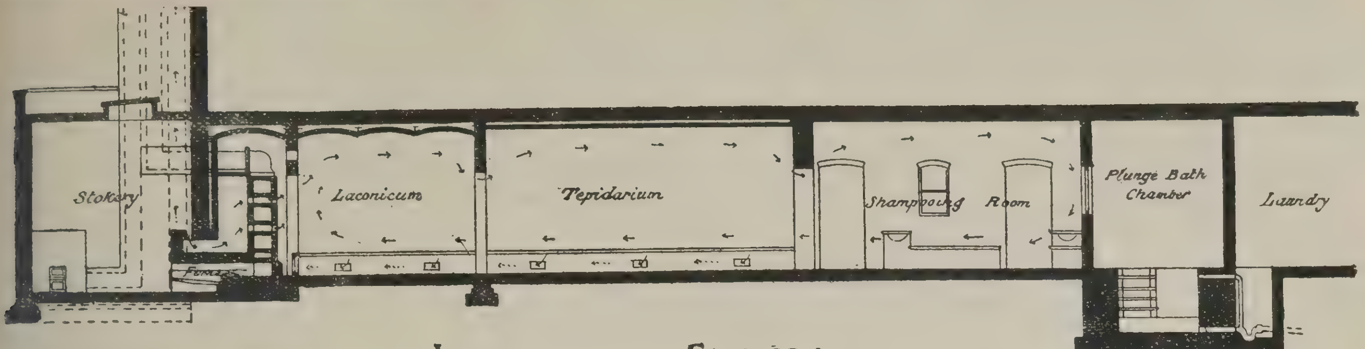
THE SOCIETY OF ARCHITECTS.

THE fourth ordinary meeting of the Society of Architects for the present session was held at St. James's Hall, Piccadilly, W., on Tuesday evening, Mr. E. J. Hamilton, vice-president, in the chair. The following gentlemen were elected as members:—Charles Granville Baker, 5, Bloomsbury-square, W.C.; William Radford Bryden, of Buxton; and Charles Edward Davenport, A.M.Inst.C.E., Heath Bank, Nantwich. The chairman proposed a vote of thanks to Professor Henry Adams, member of council, for the gift to the society of a large photograph of the Belfry of Bruges, and of small prints of the same to members issued in the last number of the *Proceedings.* This was carried unanimously.

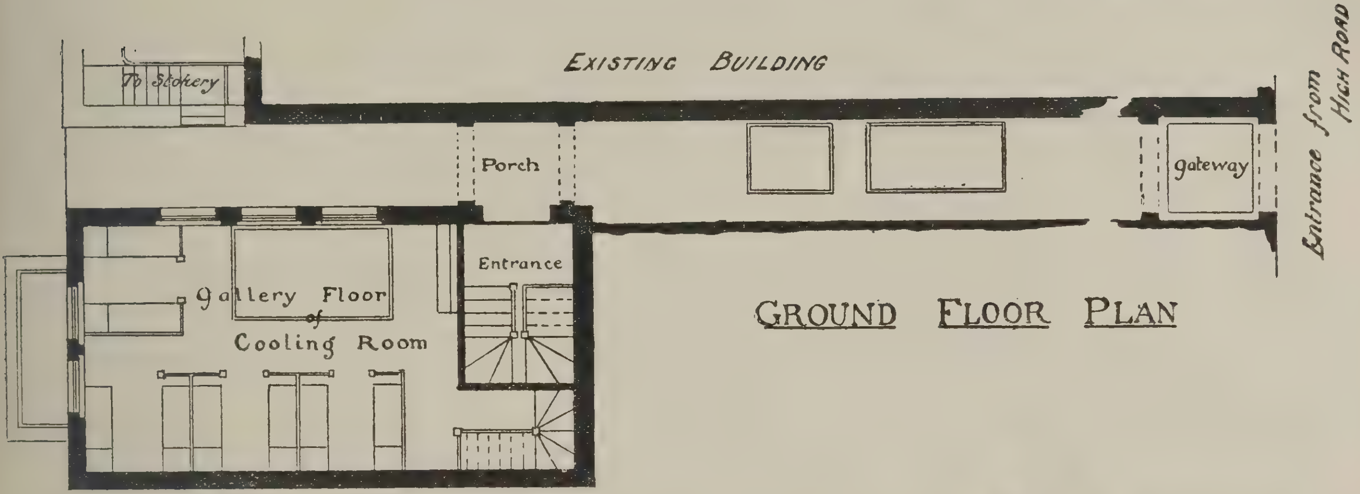
A paper on

BATHS AND BATH-HOUSES

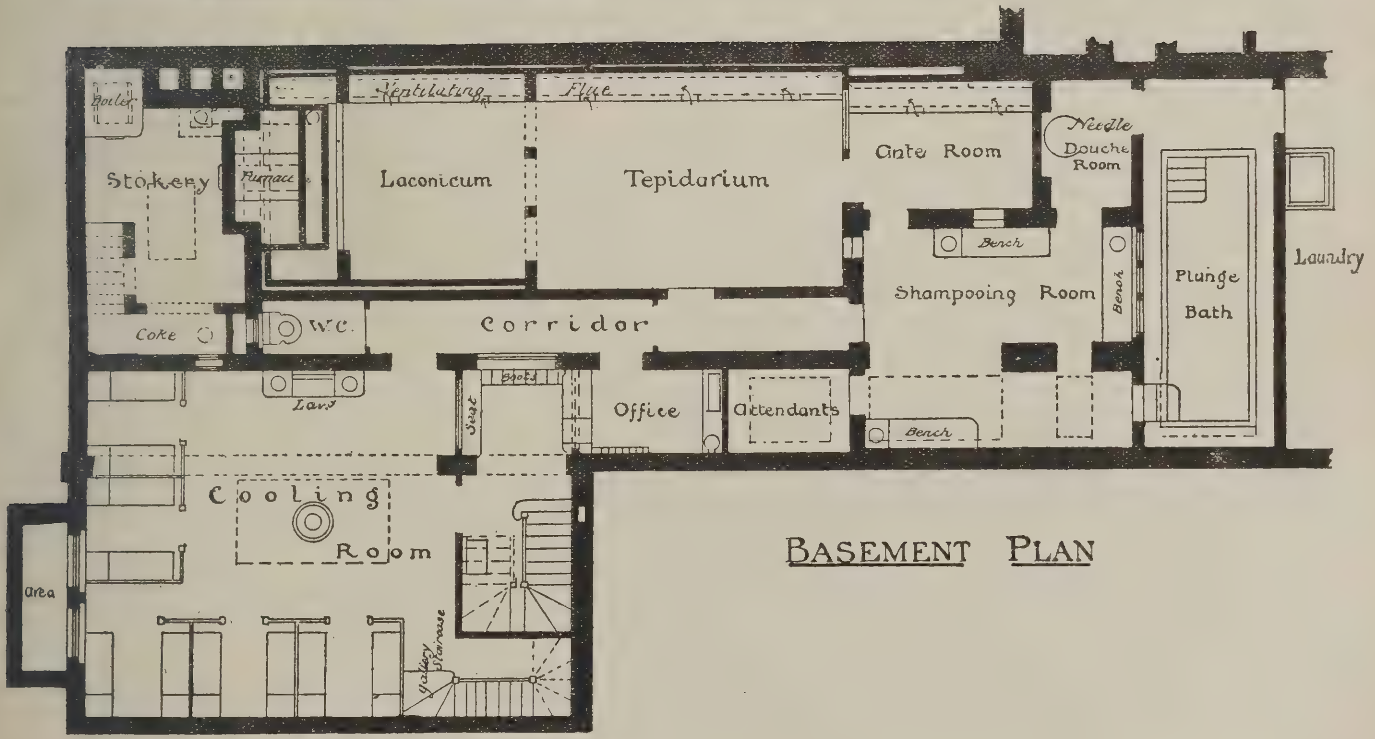
was read by Mr. R. OWEN ALLSOP, who exhibited on a screen numerous drawings, plans, and sections illustrating his own designs and those by Messrs. Spalding and Cross and Mr. T. W. Cutler. He remarked that a neglect of the study of the requirements of the day with respect to baths and bathing would ultimately throw much of the work of designing and arranging such institutions into other hands. Such a consummation would be regrettable, not merely on selfish, professional grounds, but because it is only when one's mind grasps a scheme in its entirety that complete unity is attained, with economy of construction and administration as its natural result. In a bath-house that has been the result of a division of labour between two persons—the one devising and supervising the shell of the building, and the other contriving and supplying every kind of appliance and fitting required, and arranging every detail of heating and ventilation, and neither party comprehending the ways and means of the other—in such a system of bath-building there can never be that true economy and convenience of plan and working which results when one mind grapples with the whole problem until every detail is mastered, and every part is brought into harmonious relation to the whole. It is possible for an unskilled planner to produce a fairly convenient church, a passable town hall, or a house, whose occupier shall not regard the evident discrepancies of plan as anything more than another of those ills to which the flesh is heir. It becomes, however, a matter of impossibility for anyone to plan a convenient bathing establishment, of any kind whatever, unless he has first mastered every detail of the several baths to be provided, their properties, modes of preparation, methods of administration, their heating, fitting, and accessory appliances. For, over and above the attributes of ordinary buildings, there is something in a bath-house to mark it as quite of its own kind—eminently *sui generis.* It has not merely to be built and occupied like the ordinary run of buildings. When all is complete it has to be found in working order. Unless the plan be such as will be suited to the convenience of the bathers, and adapted to the practical ends in view, it must be regarded as a complete failure; and unless the hundred and one minor details of an important bathing establishment have been foreseen and predetermined, the bath-house is a non-success. The machine—so to call it—does not work; or, if it does succeed in fulfilling its allotted task, it is at such cost as to prevent for all time the possibility of its proving a paying concern. Such being the disastrous result of bath-building without regard to ultimate working and without proper preliminary study of the subject, what are the objects to which an architect, intrusted with commissions for bath-building, should direct his study and research? Firstly, I should say, to the medical aspect of the subject. In any consideration of baths and bathing, it becomes of importance to distinguish between the merely cleansing and the curative or medico-therapeutic bath. Without a just perception of the value of each bath, whether cleansing or curative, it will be impossible to intelligently plan a bath-house of any kind. In the planning of ordinary public bathing establishments lack of medical knowledge may be of little importance; but where the architect has to deal with the Turkish bath, the bath-house of the hydropathic establishment, and public medical baths, such as those of health resorts and inland watering-places, a knowledge of baths as hygienic, remedial, and curative agents is indispensable. Let the bath architect then study the medical aspect of the subject, and acquire a correct knowledge of the therapeutic attributes of baths and the principles of scientific bathing, for which, it may be said, the term "hydropathy" is only another name. The solid fruits of such a study will be evident in the convenient disposition of the bath-rooms, the intelligent placing of the fittings, and the consequent saving of time and temper of the bath attendants. All baths may be classed under one of two heads—those having for their aim mere cleanliness of person, and those which are intended to effect some medical cure in the bather. Thus the ordinary warm-water bath is wholly referable to the former class, while the latter embraces all medical baths and hydropathic remedies, together with the miscellaneous "cures" of the different bathing resorts. A broader, and perhaps still better, distinction would be to distinguish between baths for the preservation of health and those for the cure of disease. Taking this system of classification we may include under the health-preserving bath all ordinary warm and cold baths, either in fresh or sea water, swimming-baths, shower-baths, and the Turkish bath. Under the heading of the cure of disease we shall find all medical and hydropathic paths such as douche baths, the Russian bath, electric, massage, and medicated baths, and the thermal cures with mineral waters and naturally-heated spring waters, besides all the miscellaneous baths and treatments devised by an ingenuity more or less misapplied. Baths, again, may be classified according to their respective qualities. Thus we may talk of tonic baths, sudorific baths, stimulating and sedative baths. The effects of baths upon the bather depend upon three things: firstly, the temperature of the water; secondly, the mode of application; and, thirdly, the duration of the application. A bath at a given temperature for, say, three minutes may be tonic; the same continued for fifteen minutes may be sedative. As a general rule cold baths are tonic, and hot baths sedative. Sudorific baths are hot air and vapour baths, and generally require a concluding cold, tonic bath. Hot water baths, if of considerable temperature, are also in many constitutions conductive to perspiration. They too, therefore, require a tonic application of cold water; and here we see the result of bath-building without regard to therapeutic effects; for not one out of a hundred public warm slipper baths is fitted with a shower or douche attachment, such as enables the bather to give tone to the skin after the enervating and relaxing effects of the hot water. Were there any true science in the arrangement of our public bath-houses, there would be, without exception, to every slipper bath a cold shower or douche. "I cannot think," said a friend, "why people staying at hydropathic establishments should have to do such a lot of washing. They surely cannot require so much cleansing that they must needs bath three times a day." Here we have an example of the popular delusion that all baths must necessarily be for the sake of cleanliness of person. To rid oneself of this notion is a great thing, and the first thing necessary to all who have to do with planning and arranging bath-houses. Public baths, as a present-day feature in the social arrangements of this country, are not worthy of the age. Contrasted with the institutions of ancient times they are insignificant, both in size, scope, and number. When we reflect that in old Rome at one time there were nearly nine hundred public baths, and that in our mammoth city, with its population of five millions of souls, we find only some twenty or thirty public bathing establishments, and these of a type wholly inferior to the palatial edifices of the days of the Roman Empire, we appreciate to the full the point and significance of the term, "the great unwashed." But although the present position of the question of public baths may leave so much to be desired, we cannot look round without noticing the progress made since the days preceding the passing of the Baths and Washhouses Act. That eminently humane and judicious measure has secured benefits to the poorer section of the inhabitants of large towns that have been appreciated to the full. A few moments' study of statistics showing the steady increase in the number of bathers—and washers—will show this. It is satisfactory and gratifying to find that the public baths movement has yet life and spirit, and that there is still enterprise and enthusiasm in our London vestries for the formation of schemes for bath-building. It is to be regretted that often the good intentions of the Metropolitan vestries to put the Act into operation have been frustrated by the difficulty—often the impossibility—of obtaining a site suitable for the erection of the requisite buildings. Many schemes that would prove boons to the poor in densely populated districts have thus been delayed, and some parishes, which have adopted the Act years ago, to this day remain unable to carry their intentions into practical effect. On the other hand, there are parishes in London where the neglect of the opportunities afforded by the Baths and Washhouses Act is most culpable. Of the parishes comprising London, not more than one-third—certainly not more than two fifths—have adopted the Act. It would be well, perhaps, if the Act, instead of being left to the tender mercies of vestrymen and others, were made compulsory—as compulsory as the Education Acts. Public baths and washhouses should be planned with strict regard to economy in every way that will give the institution a fair chance, not only of paying expenses, but of showing such a profit on the year's work that the balance may be placed towards the refunding of the original loans borrowed for the purposes of their erection. Many institutions have been erected, and—either on account of extravagant first cost, or by reason of their uneconomical working arrangements—are for ever prevented from paying their way. Hence they become a continual burden on the rates. And there is no valid reason why such establishments should not pay. Despite the low charges fixed by the Act for the various baths and for the use of the laundries, there are to be found existing buildings where a fair profit is shown at the end of the year's business. Such desirable results will be generally secured when those who are intrusted with the design of these establishments have given full study to every detail of arrangement and fitting required—when architects themselves ascertain and adopt the most effectual and economical means of heating, and water and steam supply, &c. We may go into public bathing establishments and see boilers of out-of-date, wasteful construction, burning twice as much fuel as necessary to effect the given purpose; engines large enough to drive twelve times the machinery with which they have to deal, their waste steam—truly such—being turned to no useful account, and wasteful irradiation from a quarter of a mile of unpacked pipings. Furthermore, bath-valves taking twice as much of the attendant's time to manipulate as they should do; and wastes emptying at a dribble while bathers are waiting in the ante-rooms for the baths they cannot get. What chance have such establishments of becoming paying concerns? In baths erected as commercial speculations this waste, through uneconomical arrangements, does not so frequently occur, for in such institutions there is the proprietor keenly alive to the various details and fittings. But in the public establishment it is apparently no one's business to see that economy is duly observed. The poor ratepayer suffers in the end, and has to "pay the piper" in the shape of lengthy lists of deficits in the yearly accounts of the establishments, or at least the interest on loans raised for their erection. Next, then, to an acquaintance with the medical aspect of baths, it would seem desirable that the bath architect should pay far more than ordinary attention to working details peculiar to the bath-house, and especially to the problems in the engineering department, not merely putting himself in the hands of this or that firm of manufacturers, but studying for himself the subject of steam and water, both for supply and heating purposes; the theory of bath heating; the various methods of maintaining the temperature of swimming-baths; the construction of furnaces and boilers, of water super-heaters, of pumps even. Learn to distinguish between the true and false in bathing appliances; between the useful and the useless in valves, cocks, and wastes. Be above, not under, the hot-water fitter: know when every pipe is in its right place, and of the proper diameter. Master the whole of the water supply from the main inlet-valve to the tanks and cisterns, and from the tanks and cisterns to the most insignificant draw-off tap. Be not deceived: a range of half a dozen long Lancashire boilers and an engine on the scale of a broad-gauge locomotive are a trifle out of proportion to the work of warming a couple of swimming-baths, heating a few washing-tubs, and driving three or four centrifugal wringing-machines. Such matters as these are "of the essence of" the



LONGITUDINAL SECTION



GROUND FLOOR PLAN



BASEMENT PLAN

success of public bathing establishments where the work must be accomplished at the smallest possible outlay. I therefore put it to the architectural profession—on the grounds before stated—whether, in such case, the study of the practical matters of baths and bathing are not of prime importance, and mere architectural questions of secondary consideration? For my own part, I would have the bath architect lay down, for the time being, the velvet coat of the dilettante, and, donning the blue blouse of the engineering mechanic, look the problem, "Architecture: a profession or an art?" squarely in the face, and find the solution that to him it shall be for the nonce an exact science. For attention to mere architectural display, where plan, arrangement, and equipment are a *sine quâ non*, is vanity and worse. The generally accepted arrangements of the public bath and washhouse have altered to a wonderfully small extent since the taking over of the Goulston-street baths at Whitechapel and the erection of the pioneer establishment in Marylebone. Practically the only change in the department of warm slipper-baths is the substitution in modern buildings of porcelain baths for the original unpleasant-looking zinc troughs, and the improvement of valves and wastes. The same white deal tops of exactly the same cut, the same deal seat, and the same cold slate slab divisions and slate doors, with the same prison-like effect about the passages, and all of the same size, and scantling to the sixteenth of an inch, showing conclusively either that unimprovable perfection has been attained, or that, ever since the inauguation of the Baths and Washhouses Act, architects have been copying one another with a touching fidelity, and exhibiting brotherly love of a degree of warmth not generally supposed to exist. In the swimming-bath department change, if not definite progress, is to be noted. The old Cornish boilers, through which at spasmodic intervals circulated the waters of the "swim"—as the bath attendants have it—are giving place to steam-heating, with beneficial results to the swimmer, the so-called "patchiness" of badly-warmed baths being reduced to a minimum by well-conceived systems of circulation. The bath itself is growing larger, every year something has been attempted in this way; and if this increase in length and water area is a true index of an increasing number of bathers, and not merely a bait to attract swimming clubs, it is a development to be welcomed. Increase of depth may also be noticed, and will delight the player at the fashionable game of "water polo," who, had he his way, would have no part of any London swimming-bath less than five feet deep. A point demanding attention and needing reform and improvement in public baths is the absence of any sudorific appliances. The Act provides for vapour baths, and some of the existing establishments possess these features in a more or less imperfect and incomplete form; in others we look in vain for even the antiquated vapour-box. On this point I make bold to suggest that the Baths and Washhouses Act is defective; and I believe that future years will see an amendment of the Act, permitting the incorporation of the hot-air bath in the public bathing establishments. The time is nearly ripe for this innovation, and the cause only requires a champion in Parliament. If the hot-air bath should be incorporated in such buildings, the innovation would do much towards maintaining a regular attendance of bathers all the year round, and prevent that lamentable falling off in the number of bathers that occurs every winter at all the establishments. Wherever the Turkish bath has been introduced into public bath-houses it has proved an unqualified success. If the Act could be amended, so as to do away with the vapour bath, which—contrasted with the hot-air bath—is worse than useless, and the Turkish bath substituted at, say, a maximum charge of from sixpence to one shilling, it would be well. After personal experiments and research, I am inclined to the belief that there is very little in the vapour baths as a sudorific appliance. Such baths act rather as depressants, and, indeed, are to the hot-air bath what the climate of a misty marsh is to the ozone-laden air of the dry breezy downs. Except in the hands of a physician, little faith must be placed in the vapour, or Russian bath, and it seems to me to be altogether out of place in the schedules of the Baths and Washhouses Act, and in the apartments of the establishments that this Act calls into existence. One other point in public baths I would mark for improvement, and that is the introduction of a cold shower bath over every warm bath—over the cheapest bath—and at no increased charge. At present we find in the slipper-bath department of public baths that one or two of the bath-rooms are fitted with the old-fashioned shower bath. Now, as before said, after a hot bath—unless the bather can step from the bath to his bed—the relaxed condition of the skin and perspiratory glands absolutely demand the application twice of cold water in order that the cuticle may be strengthened and hardened against cold. Every warm bath, therefore, should have its cold shower. The arrangement need not be anything but the simplest, and a system of waste-prevention would do away with any reckless use of water. The warm bath at present afforded by the Act, in public bath-houses, is a half measure. The whole would be complete if a cold shower were appended. If a thing is to be done, let it be done well; if the Legislature provides a cheap bath, let it, cheap or dear, be at least complete in itself. And here I am reminded of a letter I received from a "Working Man," who recently wrote to me as follows:—"I think it is of great importance if only every family could have the benefit of such arrangements (namely, Turkish baths in private houses), but I am inclined to think barely one family in a thousand could have the use of baths in their own homes, and to go from home takes time and money, and the 999 look three times at one penny when they spend it. I have thought someone might take more interest in general for the working men's benefit, and a quicker arrangement might be invented, so that in ten minutes a working man might walk into baths or a wash-house, drop a penny into a slot that would turn on a rain bath for the length of five minutes, take his soap and towel and have a good rub down in the five minutes, dress, and go on his way again." Now, at first sight, there is a spice of the humorous in the idea of a man dropping a penny into an automatic machine and receiving a shower bath for, and in consideration of, the said coin. So it struck me at first, but I have come to the conclusion that there is "something in it." A great item in the cost of baths of all kinds is always attendance; and to reduce attendance to a minimum is a great thing. The automatic shower-bath, therefore, if in any way feasible, would certainly do away with a considerable amount of attendance. The idea seems to deserve careful working out, if, as seems probable, the arrangement would still further cheapen baths for the poor. Next to the institutions of the Baths and Washhouses Act, the public baths erected by corporations for special curative purposes deserve notice. I refer to such establishments as the baths of Harrogate, Bath, Buxton, and other places possessing naturally medicated waters. Such bath-houses assume more of the Kursaal type, and indeed for fine examples of this kind of bathing establishment we must look to the Continent and bath-houses like the *Friedrichsbad* at Baden-Baden with its splendidly appointed baths. In this country, without doubt, the finest bathing establishment of this kind is the new—comparatively new—block of corporation baths at Bath, with their beautiful bathrooms, well equipped, dual dressing-rooms, and elaborate "full bath" with hydraulic cranes for lifting invalids in and out of the water. Shortly there will, I believe, be provided an elaborate bath-house of this description at Harrogate, and a few weeks ago the Corporation of Cheltenham decided upon a course of action that may ultimately lead to a similar enterprise. But the English seem to have neglected the development of this kind of bath building. As a direct consequence we have thousands of health seekers annually journeying to the Continent for a course of water drinking and bathing; whereas, there being plenty of fine inland watering-places in Great Britain, if the resources of their spring waters were properly developed, and fine, pleasant, and attractive bath-houses erected, with good promenading places, grounds, winter gardens, reading rooms, orchestras, &c.—as we find them abroad—I believe that in such a case a large percentage at least of the people now yearly flying out of the country would stay in their own land. Allied to the medical bath-house is that of the hydropathic establishment. This is a rapidly developing feature in the country, a really large section of the public being now its patrons. It therefore deserves the attention of the architect, who will find much room for improvement in the plan of most existing institutions, which, with their mean, cramped bath-houses and inconvenient residential blocks, are not calculated to forward the cause of hydropathy. We may pass over the subject of the arrangement of the residential portions of such institutions, which, in all their main features, must necessarily, more or less, resemble a well-designed, high-class residential hotel, and, as such, possess no peculiar features needing remark here. It is in the bath-houses that we find special attention and study necessary. The peculiar exigencies of the hydropathic establishment demand that careful economy of plan which I have before advocated. The great aim here, after providing for the practical requirements of each case, and the comfort of the patients and bathers, is to economise the labour of the bath-attendants. Compactness of plan, easy communication between the several rooms or departments, and a proper sequence of the bath-rooms are the chief desiderata. A great fault in most existing establishments is the want of a complete double set of baths, so that lady patients may have their bath ready at all hours of the day. The single Turkish bath is a great mistake. There should always be two. Another defect is the mean dressing-room accommodation. Connected with each bath-room for douches, massage, &c., should be two dressing-rooms. This is a point to be noted by all designers of high-class baths, whether hydropathic or not. If only one dressing-room is provided, the use of the bath-room is wasted during the time that the bather is dressing; whereas with two dressing-rooms time is economised, in that one bather may be bathing whilst the other is dressing or undressing. In these two points then, the provision of a second Turkish bath and the bettering of dressing-room accommodation, there is room for immediate improvement. The mean cramped dressing-boxes of the ordinary hydropathic bath-houses are behind the age, and detrimental to the interests of hydropathy, a fact that will be admitted by all who have spent any time in these institutions and heard the incidental complaints of visitors. If the hydropathic establishment is to flourish in the future, the bath-house must be improved with the age. The secret of success in future enterprise in the building of these institutions will surely be found in this improvement. For the public are ever appreciative of something better than anything heretofore provided. Be it a hydropathic establishment, theatre, or eating-house, the one thing needful to success in these days of refinement and luxury is to out-do all former efforts in the same direction. This may seem to some a platitude; but as one goes through the world it is impossible to help noticing that, platitude or not, the principle is constantly ignored. The Turkish bath well deserves the study of the architect. The great strides made since the Renaissance, so to speak, of this method of bathing, renders it of importance that those who have the charge of the erection of such buildings should endeavour to keep the standard of excellence of design on a par with the progress in point of numbers. I fear that this institution has suffered in the past not a little from the neglect or want of study on the part of architects, and, as a consequence, the arrangement of Turkish baths has devolved upon bath proprietors and managers, attendants and shampooers, who have been in receipt of *honoraria* from architects. As a rule, therefore, the architect has worked as a mere machine in the hands of such persons, merely drawing the plans in accordance with the advice received. The result of this has been that the design of the Turkish bath has become invested with an air of mysteriousness. Mr. So-and-so announces his patent system of heating, and a rival bath proprietor proclaims the special virtue of his method of ventilation, and so on, the outcome of which results in the curious, though illogical and paradoxical, fact that each bath in London is the "best ventilated" and has "the highest temperature." Further, such has been the jealousy with which bath proprietors have endeavoured to guard the secrets of their wonderful heating and ventilation appliances that I have heard of one who, well equipped with brush and broom, was wont to resort, in the dead of the night, to his furnace-chamber, and there, secure from the curious eyes of his own employés, unlock certain portions of the heating apparatus and proceed to sweep the flues! This is not as it should be, and in order that I may miss no opportunity of dispelling that air of mystery which yet hangs over the subject, I will now endeavour to explain in a few words the principles of heating and ventilation that should govern the designing of the Turkish bath. This class of bath may be said to consist of four parts or sections—1, the cooling and dressing rooms; 2, the hot rooms; 3, the shampooing and washing rooms; and, 4, the heating chamber and its accessories. The end and aim of the heating and ventilating devices are the maintenance of a regular temperature and pure atmosphere in the hot rooms. In the ordinary Turkish bath the heating is accomplished by means of iron stoves or arrangements of iron flue-pipes, supplying a constant stream of hot air, which, entering at an intake, passes by and over the stoves and flues into the hot rooms, and thence, having served its purpose, is extracted by one or another system of ventilation. This system of heating—though a great advance upon the methods employed in the first baths erected after the introduction of the Turkish bath into this country—has yet serious objections to its employment in a really hygienic bath. In the first place, the air is generally over-heated, and deprived thereby of more or less of its vitalising properties. Then it is a chemical fact that heated iron in a hot, dry atmosphere gives off a certain amount of metal in minute particles, which, flowing in with the rush of air, is detrimental to the occupants of the hot rooms. A third, and no less serious, objection is that, under this system, the heat is applied to the bathers by convection—that is to say, the bath is simply a hot-air bath, and not a heat-bath, as all physiologists who study the question will admit the so-called Turkish bath should be, and as the mighty *Thermæ* of ancient Rome certainly were. In order to obviate the disadvantages of the ordinary hot-air method of heating, we must employ a system of heating by direct radiation; and to avoid the over-heating of the air, and prevent its contamination with deleterious particles, we must employ in our furnaces a heating-surface of fire-brick or fire-clay. To attain an effective radiation, the heating apparatus must not be stowed away in a basement, but brought forward and exposed at the end of the suite of hot rooms, so that nothing may cut off the direct rays of heat. The heating apparatus must be of such design as, in addition to affording this radiant heat, to supply a constant stream of pure hot air. The principle of ventilation is then as follows:—The fresh air enters by way of a comparatively low-level intake, provided with an "air filter," an arrangement of glass louvres and fine cloths, to remove dust, &c., and is drawn towards the heating surfaces of the furnace. Thence it passes into the end of the suite of hot rooms, and therein follows the natural course of circulation. It flows along the upper levels of the hot rooms, and having reached the end of the suite, commences a return courses along the floor of the bath. Thus there is a constant aërial circulation in the hot rooms, and stagnation is avoided. But unless some of the air in the hot rooms is continually withdrawn, the atmosphere of the bath will become impure, and unless the vitiated air is taken out no fresh air can enter. We have, therefore, to provide for this extraction. Where, and at what level? In the ventilation of ordinary living rooms, the temperature of the apartments being lower than that of respired air, the expirations of its occupants ascend to the ceiling, and are there extracted. The temperature of the air in the hot rooms of a Turkish bath being much higher than that of respired air, and the exhaled carbonic acid gas being heavier than air, the respirations of the bathers do not rise as ordinarily, but descend, and in consequence they must be extracted at the lowest level of the bath. The ventilating openings must be placed at the floor level of the hot-rooms, and must be connected with an extraction-flue or flues, conducting to a ventilating shaft. These opening will drain away the lower stratum of air in the hot rooms, and as the exhaled carbonic acid gas will settle down to this level, the atmosphere of the bath will be kept pure, more or less so, according to the efficacy of the management of flues and shaft. So long as this ventilating shaft is kept well above the level of the cold air intake, ventilation must, in accordance with simple physical laws, be automatic and continuous. In concluding this necessarily hasty sketch of bath-houses, I would re-urge the desirability of architects devoting their attention to baths and bath-building on the practical, matter-of-fact lines I have advocated. Study the medical aspect of the subject, and we shall surely find that, in future, the deplorable errors in the misplacing of bath-rooms and the misapplying of fittings will become less frequent. Attack the engineering problems in the way indicated, and greater economies in the maintenance and working of establishments must surely result. Lastly, if you will, direct your energies to the beautifying of our streets and squares with noble-fronted bath-houses, and if you cannot equal, at least show a desire to emulate the examples of antiquity, endeavouring to raise buildings which, while blessings in the present day, shall, at the same time, be monuments to posterity.

Mr. E. Tidman, F.S.I., in proposing a vote of thanks to Mr. Allsop for his practical and interesting paper, advocated the compulsory provision of baths in all houses. Mr. Ellis Marsland seconded the motion, pointing out that, although it was usual to cover in baths with wooden roofs, the practice was a mistaken one, as timber was not a material that could withstand the variation of temperature, or the damp heat to which such a roof was subjected. He strongly supported the provision of many small instead of a few large bath-houses in a district. The motion was supported by Mr. A. W. S. Cross (Messrs. Spalding and Cross), Mr. B. Bell, who explained his system of ventilation, and advocated the employment of attractive power to draw off vitiated air at a low level, and by Messrs. J. R. Manning, John Laurie, Henry Adams, and the Chairman, and was carried by acclamation. Mr. Allsop briefly replied.

THE CRYSTAL PALACE ELECTRICAL EXHIBITION.

LAST SATURDAY an exceedingly interesting and comprehensive exhibition was inaugurated at the Crystal Palace, representing the various electric systems of lighting and electrical supply now in use, including all kinds of dynamos, accumulators, engines, lamps, and electroliers, as well as all that relates to electric telegraphy and telephony. The manager of the Crystal Palace Company, Captain Henshaw Russell, deserves no little credit for the manner in which he has brought so much really representative material together from all parts of the kingdom in illustration of the subject which he has so successfully endeavoured to elucidate. The first Electric Exhibition was held at the Crystal Palace ten years ago, but the considerable strides which have in the mean time been made in the development of all branches of electrical engineering render the previous show a very elementary affair as compared with the present excellent display. In so large an undertaking which had to be carried out in a building which has not been closed to the public for a single day, it is not surprising to find on the first day much remaining to be set in order and finished in detail.

The generating machinery shown represents every recognised type of important machine generally known, and many of these are now in every-day use in the central stations in the Metropolis and chief towns throughout the country. A powerful Kapp dynamo is to be driven by a 350H.P. Davey-Paxman engine, and a Crompton dynamo equal to about 1,000 8c.p. glow lamps is set in motion by another big engine by the same firm. Messrs. Siemens Bros. combine dynamos with Willans and Tangye engines used on P. and O. steamers; and Messrs. Crompton exhibit a machine equal to running 4,000 8c.p. incandescent lamps, the Willans engine used in this case being 200H.P. The gas-engines alone in this section form quite an exhibition of their own class, all more or less developed from the original Otto engine. The Postmaster-General shows the instruments used from the introduction of the telegraph in 1837 down to the present time, a most valuable collection displayed in the nave of the Palace. The National Telephone Company, too, have here an important exhibit in the form of a music room, where visitors, on paying a small entrance charge, may hear various entertainments and concerts at the London, Liverpool, or Manchester theatres transmitted by means of the telephone. Of course, only those performances which are in progress at the time the visit is made to the telephone room can be heard. Messrs. Croggon and Co. have erected a small tower to illustrate their tape form of lightning-conductors, and in this model building may be seen a peal of tubular bells rung by electricity from a keyboard below. The same enterprising firm have on view a good display of pendants, artistic lamps, and wall-brackets worth looking at. The Egyptian mosque hard by, arranged as the stand of Messrs. Rashleigh, Phipps, and Dawson, is introduced to illustrate the application of electric lighting in forms used by the Assyrians. The lights and poles, hand regulating holtophote city posts, iron brackets of all shapes, and samples of submarine cables shown by Messrs. Siemens Bros. constitute a large display of much utility; while of equal interest is the collection of show buoys and other marine apparatus on the large stand of Messrs. Johnson and Phillips. Messrs. Waygood's electric passenger lift, driven by a Siemens single magnetic circuit motor, is in use for elevating visitors to the galleries of the Palace, where the popular side of the Exhibition is more in evidence. Here are various rooms furnished in leading styles, such as the Jacobean and the Italian, to illustrate the application of electric light to bedrooms, boudoirs, dining and drawing rooms. Among the telephone exhibits we noticed all descriptions in operation by Messrs. F. C. Allsop and Co., of Clerkenwell, and the Blackman Ventilating Company show two Blackman fans driven by separate electric motors, illustrating the various and effective applications of these exhausts and blowing-in supplies. Messrs. Chubb and Sons Lock and Safe Company are exhibitors of the latest improvements in electrical alarms, and they also include in their collection several patent gunpowder-proof locks, wedge and drill-resisting plate doors and other appliances. Messrs. Dorman and Smith are makers of porcelain switches and cut-outs, carbon contact switches, switchboards, and general accessories for electric-lighting of the most recent shapes and patterns. Messrs. Easton and Anderson figure in the machine-room, and supply currents to various stands in the exhibition, besides illustrating the transmission of power. Here, too, are to be seen the exhibits of Messrs. Roberts, Adlard and Co., of Eastcheap, with their slate slab switchboards, and other electrical mounts, deserving of attention. In one of the galleries the Medical Battery Company are the exhibitors of various medical batteries and electrodes, ozone apparatus, chiropody and dental chairs, reversing statical current apparatus, and aural appliances.

NEW BUILDINGS IN BIRMINGHAM.

MR. F. W. LLOYD, the city building surveyor, has supplied us with the following return of new buildings, &c., for which plans were approved during the year 1891, together with a summary of the three previous years:—

	1891.	1890.	1889.	1888.
Houses and shops	966	1,061	938	2,034
Business premises	36	65	18	63
Manufactories, warehouses, and shopping	183	179	163	124
Churches	0	0	2	0
Chapels	0	2	0	3
Schools	3	3	3	3
Miscellaneous	214	185	211	182
Alterations and additions	139	213	195	178
Totals	1,541	1,708	1,530	2,587

About 1,000 houses are each year erected in the city. The great disparity between 1888 and the other years is due to the fact that plans were approved in that year for several large blocks, each containing upwards of 100 houses, some of which are not, even up to the present, entirely completed.

It will be seen that the purely manufacturing premises show a steady increase throughout the whole series of years, whilst, in addition to the actually new business premises, under which head are classed large retail establishments, hotels, suites of offices, &c., there are many included under the head of alterations and additions which almost amount to a reconstruction of existing business premises. Although there are no churches or chapels this year, there are several mission-rooms, notably St. Thomas's, Church of England, Ellis-street; Church of England (iron), Harrison-road; Methodist (iron), Dudley-road; a brick mission-room in Camp-hill, and a Congregational Mission in Waverley-road. The schools, three in number, are Roman Catholic Boys' School, Bartholomew-street; King Edward's Girls' School, Stratford-road; and Seventh-Standard Technical School, Waverley-road. The miscellaneous include—Birmingham General Dispensary, new branch, Burbury-street; New Pig Market, Bordesley-street, Allison-street, and Meriden-street; Hide and Skin Market, Bradford-street; Athletic Institute, John Bright-street; Assembly Rooms, Dudley-road; Salvation Army Barracks, Corporation-street; extension of School of Art, Cornwall-street: enlargement of Blind Institution, Church-road, Edgbaston; and new premises for Young Women's Christian Association, the Crescent. Amongst the additions and alterations are:—Additions to Roman Catholic Girls' and Infants' Schools, Bartholomew-street; enlargement of Church of England Schools, St. Barnabas, Ryland-street; new Cookery School, at Soho-road Board School; enlargement of superintendent's house, Winson Green Asylum; alterations and improvements at Town Hall; additions to Midland Institute; and to Lecture-hall, Severn-street. The houses include the 65 artisans' dwellings, built by the City Corporation in Ryder-street, Old Cross-street, and Lawrence-street.

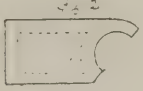
In order to give some idea as to the progress of buildings in the recently annexed districts, the following table is given, the numbers in which are not included in the preceding table:—

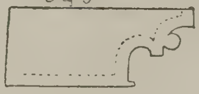
	Balsall Heath.	Saltley.	Harborne.
Houses and shops	674	233	11
Business premises	0	1	0
Manufactories, &c.	6	3	0
Miscellaneous	18	4	1
Alterations and additions	0	3	9
Total	698	244	21

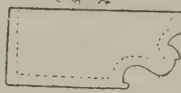
We are informed that the average rate of increase in Harborne is about 100 houses, &c., but the past twelve months have been exceptionally quiet.

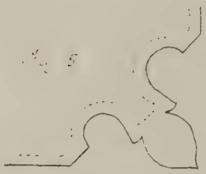
From the above return, taking into consideration the nature and size of many of the alterations and additions, it may safely be assumed that, so far as Birmingham and district is concerned, the building trades have had a busy year.

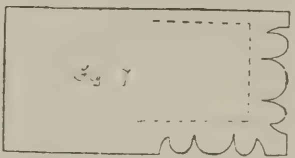
Six hundred and forty-five notices have been forwarded to property-owners and others as to dangerous buildings, projecting signs, emblems,

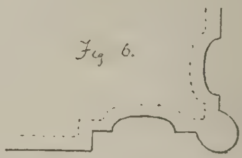


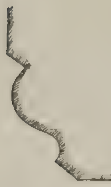


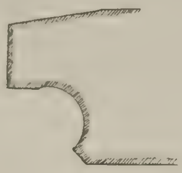


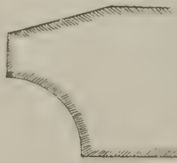


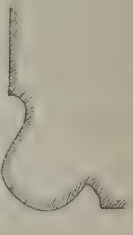


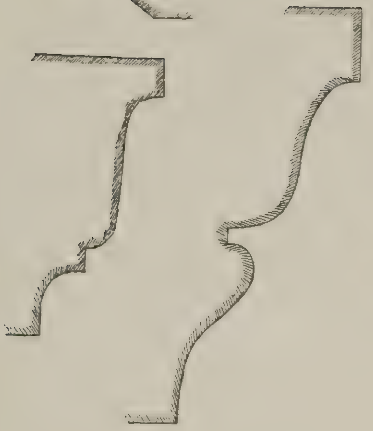


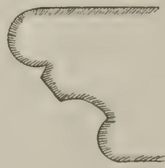


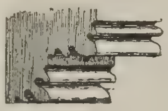


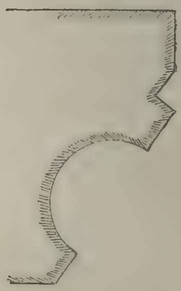












&c. During the year a quantity of land, amounting to 176½ yards superficial, has been conceded to the corporation by owners of property setting back projecting windows, steps, &c.

* * *

NOTES ON TERRACOTTA.*—VI.

SECTIONS.

In this article free use will be made of actual terracotta sections, to show either their fitness or unfitness, as the case may be, for reproduction in this material, with a view to arriving at a general principle to aid in the design and selection of mouldings suitable for a terracotta treatment. A principle well understood by manufacturers is that the blocks and their members throughout their entirety should be made up of a uniform thickness of clay, so as to obtain a uniform shrinkage in the process of drying and firing. This principle cannot be too strongly emphasised; and manufacturers who undertake the reproduction of sections in which this principle cannot be mainly adhered to are, in a measure, to blame for bringing discredit upon a material which should not attach to it. It is at least incumbent upon them to point out these things before putting the work in hand. Delicately and intricately-formed mouldings are always more expressive of a refinement of taste and feeling than those of a larger type. But it has been already shown that these are the less suitable for terracotta; and nothing will serve the purpose of illustrating this better than the arch-moulding of the 13th-century or Early English, Fig. 1, in which it is utterly impossible to get a uniform thickness of clay in the build of the block. Delicate and intricate mouldings are more successfully treated in solid prisms of brick sizes, or approximations to brick sizes; the greater number of joints thus obtained affording facilities for intersecting the various individual members. he profiles of mouldings of the most successful terracotta sections are of a large, bold type, partaking of the simple characteristics of the Classic orders, and of the Romanesque, the former "capable," says Professor T. Roger Smith, "of producing the most delicate changes of light and shade, and contours of the most subtle grace." The adjoining figures represent typically good and bad terracotta sections.

Fig 2. The incut of the hollow is so great that little attachment is left between the salient member and the body of the block. This is fit only for a brick size, and even at that the chances are that it would be but an abortion of the true shape.

Fig. 3. Here again the incutting and partial detachment of the hollow and the bead below the top fillet enhances the risk of a true section when fired. The bead would unavoidably be a solid piece of clay plus the thickness of the general build of the block (from 1¼in. to 1½in.), shown by dotted line. The shrinkage of the bead would, consequently, be greater than that of the other parts, resulting in an unsatisfactory section. Fig. 4 is an improvement of the previous sections, as will be seen by the dotted lines, showing the clay uniformly thick throughout the block. The very beautiful profiles, Figs. 5 and 6, though appearing as actual terracotta sections, are too detached and redundant of members in one block. This is even more so in Fig. 7. The remaining Figs. represent typically good sections, considered from the point of view as admitting a uniform thickness, and as not possessing too many members in each block. In Fig. 7 there are no less than eight members, and, apart from any other objection, it would be found impracticable, in fixing the work, to keep the true continuity of line of any one member, without, almost to a certainty, throwing out of intersection a greater or less number of the remaining seven members. When such sections have to be fixed, the salient members should be worked to, in preference to the retiring ones, and those which will be in shadow. But in spite of all the skill and patience that may be bestowed, unsatisfactory work will be the result of the employment of such contours.

All knees, returns, and arch or label springers, whether moulded or pressed, should be produced in one piece, not formed of two separate pieces, united by means of a "stuck joint," thus: In the case of label springers or returns, two pieces of the moulding are cut to the required length and angle—45° or otherwise—as a joiner would cut a mitre. The areas of the two sectional cuts are scored by a sharp-pointed knife and a mason's drag to form a key, and are then closely rubbed together with a medium of soft clay to unite the two pieces. This method, though saving the cost of making a mould, often proves dearer in the long run. It is "scamped" work, and should not be permitted. The greater proportion of such joints will not stand the crucial test of the kiln; and even those blocks which do, are easily reduced to their constituent pieces by a smart, jarring blow of the trowel of the fixer.

It is a practice of some architects, in the case of foliated capitals and other ornate features of a peculiar character, to have a model of the intended work executed in plaster of Paris under their own personal supervision, which, when approved, is sent to the manufacturer to be used as the "original" from which to take off the piece-moulds to be used in the reproduction of the work. This practice recommends itself as at least saving the architect a journey of, perhaps, a considerable distance, and the manufacturer the responsibility of a possible doubtful interpretation of the architect's ideas. Cellular or stone-like terracotta is produced in a manner somewhat similar to that described as pressed through the "die." This is used in the execution of Mr. Colcutt's design of the new bank at Ludgate-hill, now building. The advantage claimed for it is that it can be worked like stone—*i.e.*, in the case of arch blocks, for instance, cellular blocks of clay would be produced, rectangular in shape, and the radial or wedge-shape of the voussoirs afterwards brought about by the removal of the surplus clay. This could be done while the block is in the plastic state, or at any time between then and its going into kiln, by "wasting," or working it off with a mallet and chisel; but, preferably, while it is in the former condition. This mode of manufacture, if brought to a successful issue, would raise terracotta *par excellence* as an exterior building material. At present, it can be said to be only in the experimental stage. What has been accomplished in this direction is due to the enterprise of the firm of Sir Henry Doulton and Co, Lambeth. The great expense attaching hitherto to its production is, perhaps, the chief obstacle to its ultimate success; but, taking into account the ravages of time on our old stone-built structures—monuments of the deep-seated veneration and superstition of the Middle Ages, "when art was still religion," and Palissys and Dürers were found in every craft, stamping the work with the individuality of the workman—one cannot but regret that the consideration of cost should hamper us to-day in the choice of an enduring material which, properly employed, might enter into a rivalry with those grand old architectural piles, surrounded with the quickening atmosphere of inspiration, but built, alas, with such perishable material! Cellular terra-cotta will be further dealt with in the next article.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY. — A special meeting of the above society was held at their library on Monday last, under the presidency of Mr. T. Harnett Harrison, F.R.I.B.A., when a paper was read on "Cement and Cement Testing," by Mr. J. A. Berrington, A.R.I.B.A. fully illustrated by practical tests of specially prepared briquettes, by a Michele machine, also by the use of Vicat's needle, and the method of sifting, weighing, mixing, &c., in order to ascertain the quality of the cement, were fully gone into. All the briquettes tested yielded very good results, as much as 1,000lb. tensile stress being registered on the area of $2\frac{1}{4}$in., four days old, dry mixed. Special attention was directed to the method of mixing in favour with manufacturers—i.e., very dry mixing, some of the tests being with briquettes with 16oz. of water to 48 of cement, and others with 10oz. of water to 48 of cement, the latter giving much better results; but it was pointed out that cement mixed so dry as the latter could only be used for such purposes as foundations for roadways, carefully rammed and consolidated (and the same method had to be adopted to fill the moulds for the tests). If used as mortar or for any other purposes, 25 per cent. of water was as little as could practically be used, and this proportion was considered the legitimate test. The paper and the experiments were much appreciated by the members, as giving them a practical insight into the modes of testing and the best manner of judging of reliable cements, which are not always open to the investigation of architects. A hearty vote of thanks was accorded to Mr. Berrington, which was extended to Mr. A. Ellis, who assisted in the experiments.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of the Society was held at the School of Art on Tuesday, the 12th inst. Mr. F. R. Farrow, F.R.I.B.A., vice-president of the London Architectural Association, read an interesting and instructive paper on "The Ventilation of Public Buildings." He commenced by defining the principles on which ventilation depends, being the substitution of fresh air for foul air, which to be successful must be without draught. Foul air is air vitiated to a certain definite extent, fresh air, air in a normal state of purity. Draught is the unpleasant contact of moving air with the person, and air is a fluid and a gas, and, therefore, heated air is lighter than cold air of equal purity, and foul air is heavier than fresh air of equal temperature. In elaborating these points he gave figures as to, and formula for the calculations of proper temperatures, speed of incoming air, to avoid draught, size of flues, engines, &c., and described the proper means for effecting the purposes required, either by natural or artificial ventilation, showing the superiority of the latter over the former. He gave several examples of different forms of ventilating apparatus and their application to different classes of building, including some of the large public buildings of Vienna, the Rathhaus, University, Bourse, and Grand Opera House, which are ventilated on elaborate systems. He showed what to avoid in planning out systems, and the essential points to be provided.

◆

The new board schools for boys at Charlotteville, Guildford, were opened on Friday. They accommodate 400 scholars, and for the erection and furnishing, the tender of Messrs. Morgan, Isted, and Morgan, of Southampton, was accepted at £4,200. Mr. W. G. Lower was the architect, and Messrs. Hammer supplied the school desks and furniture.

Building Intelligence.

ALNWICK.—Felton Wesleyan Methodist chapel was opened last week. It is a Gothic structure, built of local stone. The size internally is 36ft. by 24ft., and the schoolroom at the western end is 30ft. by 15ft., a part being screened off by revolving shutters to form a sewing-room, or vestry. Advantage has been taken of the difference of level to get a heating place under the east end of chapel, in which is placed a Grundy hot-air stove. The roof has wrought-iron segmental principals, with wood boarded ceiling up sides of roof and carried across under collar-beams. The seats are open benches of pitch-pine. The pulpit-platform is raised five steps at the west end, and is on the same level as the schoolroom behind it, enabling the minister to see its occupants from the pulpit, through an open screen with tracery. The architect is Mr. F. R. N. Haswell, F.R.I.B.A., of North Shields.

CARNALWAY.—The parish church of Carnalway, which, with the exception of the tower and spire, has been rebuilt, has been consecrated by the Archbishop of Dublin. The new church was designed by Mr. J. F. Fuller, the dioscesan architect, in the Hiberno-Romanesque style, and his designs have been carried out by Mr. A. P. Sharp, of Brunswick-street, Dublin. The church consists of a chancel, choir, choir transepts, nave, vestry-room, and entrance-porch under the tower. The organ stands in the north transept. The transepts and choir are fitted with carved seats, and desks of solid oak. The inner roof is a perfect semicircle, sheeted with pitch-pine, and supported by carved pitch-pine ribs.

CORK.—A fresh block is being added to the district lunatic asylum, and is now approaching completion. It is 300ft. long, and will provide accommodation for 400 additional patients. It is four stories in height, and is divided into day-rooms and dormitories, with a considerable proportion of single rooms for patients and attendants. Three large annexes have been built to the rear, containing lavatories and sanitary accommodation for each floor. The upper stories are approached by three staircases with granite steps, and walls lined with white glazed bricks. Externally the building is lined with red brick. The heating apparatus is being erected by Mr. Grundy, of London. The building stands by itself at a distance of about 600ft. from the main building, and they will be connected by a covered passage. The plumbing and gas-fitting have yet to be done. The total cost will be about £26,000. The architect of the new buildings is Mr. W. H. Hill. The contractor is Mr. Samuel Hill.

ORPHAN WORKING SCHOOL, HAVERSTOCK HILL.—These schools, which usually have over 500 children in occupation, have had to be closed, and the children removed, owing to defects in the sanitary condition of the buildings, and the Estates Committee instructed their architect, Mr. Chas. Bell, to prepare plans and specifications for putting matters in order. Mr. Bell prepared two schemes, one for improving the existing sanitary arrangements in their present position, and another for building detached separate sanitary blocks. As either of the schemes were likely to entail considerable expense, it was decided to consult some eminent sanitary expert on the matter, and Mr. Edward Tidman, C.E., F.S.I., of Westminster, was instructed, and has just reported to the committee, advising the adoption of the separate detached blocks with certain modifications. Mr. Tidman's report was adopted, and the architect instructed to obtain estimates strictly on the lines of Mr. Tidman's report and recommendations, and it is proposed to carry out the work without delay.

◆

An inquest was held last week at Prittlewell, Essex, on the body of James Bragg, builder, who committed suicide on Saturday by cutting his throat with a carving knife. It was stated that deceased, who was 75 years of age, suffered from insomnia, and a verdict of unsound mind was returned.

New schools of science and art in Berkeley-square, Clifton, Bristol, were formerly opened on Friday. The premises include six studios, each 29ft. by 21ft., and other rooms. Messrs. Trew and Sons, of Broad-street, Bristol, were the architects, and Mr. G. Elmes, of Windmill-hill, Bedminster, was the contractor.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

TECHNICAL.—BOND. (The sketch you give does not show the mode generally used. The bricks are laid as stretchers on one side and headers on the other. There should be no straight joint through face, as you show; the third header from angle should break the joint by $2\frac{1}{2}$in., then the closer follows. Study the examples given in Rivington's "Building Construction," which is all you need to pass the Government exams.)

RECEIVED.—F. R. G. Co.—C. K. T.—Cambrian.—S. C.—A. N. and Co.—L. G. T.—R. M. S. Co.

Correspondence.

WHAT IS ARCHITECTURE?

To the Editor of the BUILDING NEWS.

SIR,—1. If a duly qualified person calling himself an architect, employ his vacant time in competitions; or in perspective views for exhibitions, or build for a client who liquidates, and so he loses money to which he is entitled; or if he revel in the study of sculpture, mosaic, decoration, and such-like productions that do not pay in the long run;—then architecture is a Profession.

2. If an architect be in sufficiently good practice to keep in his office an accountant who is artful enough to send his bills in the day the work is done, and can secure 5 per cent. upon the cost of the building, prompt cash, without discount; or if he become a shareholder, director, or designer in a retail concern, called "Æsthetic and Co., Limited," for the manufacture and sale of keramics, metal works, mural adornments, or woven fabrics in loud patterns and dubious tints, any of which can be specially, or indirectly, quoted in his building specifications, so that he can make good profit out of art productions—then architecture is an Art.

3. If an architect, in building speculative, bay-windowed Queen Anne houses, or bungalows, invest his money so that they meet with a ready sale, owing to the attraction of the band of music daily upon the pier at Mudford-on-Sea, and he clear 15 per cent. by the transaction—then architecture is a Trade.

4. If an architect design and superintend the erection of a building, but, under the advice of his solicitor, so arrange the conditions of contract that the settlement of the builder's bill of extras and deductions is relegated to a quantity surveyor as sole arbitrator, the final result being that the architect receives just payment for his honest services without a counterclaim deduction by the client, notwithstanding the judicial decision in the recent case "Rogers *v.* James,"—then architecture is a Science.—I am, &c.,

R. P.

Intercommunication.

QUESTIONS.

[10695.]—**Bricks and Brick Making.**—Could any reader of the Building News inform me whether there is such a thing as a small hand-machine for moulding bricks? Also where I could see a small kiln (on the Hoffman system) for burning bricks?—Currie.

[10696.]—**Paint.**—Will any reader kindly inform me how to find out how many coats of paint have been laid on woodwork when six coats have been specified? Some clerks have glasses. The paint is cut with a knife, and then a glass is held to it, which reflects the different layers of paint. Where can I get such a glass, and what name is it known by?—Inductus.

[10697.]—**Keeping Surface-Water out of Cesspool.**—Will some reader kindly inform me the best way of keeping the surface-water from percolating through brickwork of a cesspool? The cesspool, 7ft. square and 10ft. deep, is in 9in. brickwork, puddled with clay outside and cemented on inside when finished; but hitherto the incoming water prevents this being done.—H. L. H.

[10698.]—**Building Line.**—The by-laws of the corporation of the town in which the writer has some cottage houses to erect, contain nothing referring to the building line; and on submitting plans for approval of the borough surveyor, showing the cottages set back 9ft. from line of other buildings, with a low wall with palisade railing on top, in same line as other property, the building committee refuse to pass the same, unless the front of the cottages is lineable with others. Under the Public Health Act, 1875, I notice a clause to the effect that the urban authority have power to fix the building line of any property to be pulled down and re-erected, but it does not seem clear to me whether or not a person may set the front of any new building behind the fixed line on either side. Would any of your readers give an opinion on this matter?—Doubt.

[10699.]—**Safe Loads for Timbers.**—Will any reader say how the safe load for timbers of various sizes is arrived at, both for distributed loads and the reverse, and what is the best book on the subject?—S. T.

[10700.]—**Traps.**—Can any of your readers suggest a means of keeping an ordinary 4in. Buchan trap clear where the drain (which is 4in. diameter) has only a fall of 1½in. to 10ft. for 18yds.? Although the closet flushes four gallons at a time, the force of the water when it reaches the trap is not sufficient to clear paper and soil out, the result being that every fortnight it has to be cleaned out. Owing to the level of the main drain, I cannot get a greater declivity than stated above.—R. A.

[10701.]—**Ventilation.**—What would be the best method of ventilating a public hall 70ft. long by 38ft. wide, 16ft. from floor-line to eaves, and 34ft. from floor-line to ridge? The hall is lighted only by No. 6 skylights on either side of the span roof, each 8ft. square, and having in each alternate skylight a portion to open 3ft. 6in. square. The hall is approached by an entrance 20ft. in length leading from the street. It is surrounded by adjoining buildings on all sides, and but little open space is given at the sides by which to obtain inlet ventilators, such as Tobin's. Would any of your readers who may have used Boyle's ventilators favour me with their experience of them, and state if No. 4 of these were fixed at the top of roof, sufficient ventilation would be promoted, and would they act without causing any resonant sounds and dreadful noises? I wish to use blinds to the No. 6 skylights on the south side, and shall be obliged if some reader will inform me what description would be best, and most effectually block out the sun's rays without obstructing any light. Also, in their opinion, what kind of glass would answer best? It is necessary that the ventilation in this hall should be kept up most in the summer time.—C. W. S.

REPLIES.

[10691.]—**Fascia.**—One mode of fixing the stone fascia to iron girder would be to have copper cramps at intervals fixed to the upper flange of girder, with bent ends in the stone; but without further particulars as to the kind of girder, and how near the fascia is to be fixed to it, one cannot answer. The partition, if well braced or trussed, would do if the floor is not a heavy one.—G. H. G.

[10692.]—**Temple of Minerva at Priene.**—Consult Vitruvius i. 2 and vii. This temple was of the Ionic order, though many of the temples to Minerva were of the Doric order, and the plan would follow the general type of buildings. I think, if memory does not fail me, that the temple of Minerva Polias at Priene was hexastyle. A "Student" would do well to refer to Gwilt if he has not done so.—G. H. G.

◆

Mr. Fenwick, of Windermere, was appointed, on Friday, manager of the Retford gas and waterworks, at a salary of £200, with house, coal, water, and gas provided free.

In the bankruptcy case of William Bulcock, of Tue Brook, near Liverpool, builder, the order of discharge has been suspended for six months, ending May 20 next.

Legal.

CERTIFICATE AND ARBITRATION CLAUSES.

When a building contract contains, as it often does, a clause distinctly making the architect's certificate conclusive in all respects, and a concluding clause referring all disputes to the architect as sole arbitrator, questions of construction may arise that are not readily answered. The object of the certificate clause is to prevent disputes from occurring at all, by making the granting of this certificate by the architect a condition precedent to any enforcible claim by the contractor. It follows that when such a clause is clear and conclusive, it is binding on the parties in regard to all work coming within its scope, and that, therefore, as to such matters, there can be no dispute to submit to arbitration. Indeed, this clause making the architect's certificate conclusive may be described as a clause for the prevention of disputes; while the arbitration clause, if added, is for the settlement of disputes, if any, that may or can arise outside and beyond the scope of the certificate. As to whether or not the certificate is made so conclusive as to be a condition precedent, and thus preventing all disputes from arising, that must depend on the wording of the contract itself. Presuming that it is not so clear as to be legally conclusive of the right of the contractor to dispute the architect's decision as to work or measuring up, then these matters could be brought up for arbitration under the clause by which he is appointed sole arbitrator.

If, however, it is intended that all disputes, including those arising after the completion of the work, as well as those cropping up during its progress, are to be covered by the arbitration clause, this must be widely drawn. Such a clause will always be construed very strictly by the Court, and it has often happened that, though the arbitrator had the power of deciding all disputes arising during the progress of the works, he had no jurisdiction to deal with disputes occurring after their completion, and affecting the true measurement of the work or the price to be paid. It is clear, however, that an arbitration clause cannot apply until a dispute has arisen, and then only to such disputes as are within its scope. For these reasons the certificate clause is frequently so drawn as to make the granting or refusing a certificate by the architect conclusive between the parties, and thus entirely preventing disputes from arising; while, if any questions escape this clause, they are dealt with in a general arbitration clause by which the architect is made sole judge. But he must do so judicially, and he must exercise his office with firmness and discretion, after hearing both sides of the case.

Fred Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Boz.—Arbitrator.—Of course, you have a lien upon the award, and need not give it up until paid your fees. But although it is now generally thought that there is an implied promise to pay his fees, although an award is not taken up, it is better, in the agreement to refer, to get an express promise from the parties to that effect.

Builder.—Certificate.—If the architect does not certify to a sufficient amount, he will not be liable to you as the builder, even though negligence and want of skill are shown, unless you can go so far as to prove some fraud or *mala fides* on the part of the architect, of which there seems no sign in this case.

◆

Newmilne House, near Perth, at present tenanted by Sir John Millais, R.A., was almost entirely burned down on Monday, but the greater portion of its valuable contents was saved. The fire is attributed to the overheating of a flue.

A new church schoolroom was opened at Bagby' near Thirsk, on Tuesday, by Lady Payne Frankland. The building is capable of accommodating seventy scholars, and has been built by Mr. W. S. Kay, of Acomb, the architect being Mr. M. W. Lewis, of the firm of Lewis and Sons, York.

A public drinking fountain, surmounted by clock tower, &c., is about to be erected in the Market Place at Willenhall, to the memory of the late Dr. Tonks. The structure, which will be 26ft. high, and will cost about £250, has been intrusted for execution to Mr. J. Roddis, of Birmingham.

LEGAL INTELLIGENCE.

A District Surveyor's Slip.—Messrs. Ray, builders of the Sun Wharf, Wapping, were summoned for erecting that building not in conformance with the Building Act. It was stated the place had been let at £700 a year; and the district surveyor, Mr. Stock, admitted he had not served a notice concerning the defects. Owing to this neglect, Mr. Mead dismissed the summons and ordered Mr. Stock to pay the defendants' costs, £1 10s.

Breach of Building By-laws.—A builder, named John Lawrence, of Wigfall-road, Sheffield, was summoned before the magistrates of that town on the 5th inst. for breaches of the local by-laws. Defendant built six houses in Sharrow Vale, and, refusing to comply with the regulations in respect to his attics, was served with legal notices calling upon him to do so. He complied with the regulations, but afterwards altered the attics back to the former condition. He was summoned in July last for this offence, and was fined £10 and costs. Yesterday he was summoned again for continuing the former offence, and he was fined in all £35 16s., including costs.

Legal Ambiguity as to "New Streets."—Vestry of St. Giles, Camberwell, v. Crystal Palace Company.—In this case, heard by Mr. Justice Day without a jury, at Guildhall, on Monday, the plaintiffs claimed for part repairing a road the plaintiffs alleged the defendant company was liable for as adjoining owners. The Solicitor-General said the road, in respect of which the claim arose, was called the Crystal Palace Parade, and was 80ft. wide, being perfectly straight, and going from end to end of the Crystal Palace. In 1890 the plaintiffs resolved that this was a new street, and, not being paved to their satisfaction, they called upon the adjoining owners to pave the street. After due notice the work was done by the plaintiffs, and they claimed from the defendant company the sum of £2,926 as their share of the cost. These facts were not in dispute, nor was it disputed that the defendant company had, since the passing of their Act in 1883, up to 1884, repaired the road in question at a cost of from £258 to £300 a year. Mr. Reid, for the defence, contended that the road in question was an ancient highway, and not a new street within the meaning of the Metropolitan Local Management Acts, and that, though the defendants had repaired the road in ignorance of their rights, that did not deprive them of their rights in law. Mr. Justice Day said that considerable doubts and difficulties arose in his mind from the unhappy language the Legislature had thought fit to use with regard to the paving of new streets, and, as far as this case was concerned, the best construction he could put upon the statute was that this road in question was a new street, and that it had never been taken in charge and repaired by the local authorities. On this short ground he should give judgment for the plaintiffs, with costs. but directed a stay of execution, remarking that he considered such an application reasonable upon any question of a new street.

Cabinetmakers' Customs.—The hearing of the case against Mr. David Sandground, wholesale cabinetmaker, of Phipp-street, Shoreditch, who was summoned by two men for money due to them on work which they had not been allowed to finish, was resumed at Worship-street on Saturday. We gave some particulars of the case in our issue of Dec. 25, p. 925, last Vol. Evidence was now given as to the custom of the trade—whether the men on piecework were entitled, if they thought fit, to leave their work for a day or two, or longer, and be allowed to return to finish their work. Cabinetmakers, mainly journeymen, were called on behalf of the complainants, to prove that it was the practice for the worker to go off if he felt lazy or wanted a rest, and that, though he might be away any time from half a day to three consecutive days, he was still entitled to go in and finish his contract when he pleased. Many of the witnesses said they had not heard of any man being away four days at a time, but they considered that the master had no right to prevent a man returning if he stayed away so long. For the defendant fifteen or sixteen witnesses, many of them master cabinetmakers, employing 40, 50, or 80 men, were called to give contrary evidence as to custom. They agreed that, though there was no custom, there was a "pernicious habit." Mr. Rose said he had come to the conclusion that there was no custom, properly so called, to justify the claim of the workmen to be absent in the course of their contract work. As the men had had notice of their employer's intention, the defendant was justified in putting other men on to complainants' work. Judgment would, therefore, be for the defendant; but his counterclaim for 37s. 6d. for damages was also dismissed.

"New Streets" and Compensations to Frontagers.—Reason v. the Mayor and Corporation of Folkestone.—In the Queen's Bench on Wednesday, Justices Lawrence and Wright heard this special case, the question being whether the plaintiff was entitled to compensation for a strip of land which he said that defendants had taken from him to widen the public way. UNIVERSITY OF [illegible]

kestone there was an old thoroughfare called
ldy-lane, which was about 27ft. wide, and
which there were no houses previous to 1865.
ce then 22 houses had been built there, and
ently the plaintiff built two houses which were
:. from the road, and he began to put up a wall
oining the highway. The defendants, however,
med the right to make him put his wall 13ft.
k, so that the thoroughfare might be made 40ft.
le. This they did under the provisions of their
provement Act of 1855. The question in dis-
e between the parties was whether the thorough-
e in question was an existing street or a new
eet within the meaning of the statute. The
rt held that this was an existing street in 1855,
l though it might be now called a new street
l out, yet the plaintiff was entitled to compersa-
n for his land that had been taken.—Judgment
plaintiff.

VATER SUPPLY AND SANITARY MATTERS.

A Doctor's Defence of Back-to-Back Houses.
At the annual meeting of the Yorkshire Society
Medical Officers of Health, held at Bradford last
ek, Dr. J. F. Bell, of that borough, read a paper
"Artisans' Dwellings in Bradford," in which he
gued that careful examination of vital statistics
owed that in Bradford, at any rate, there was
marked excessive mortality in back-to-back
uses. At Ripleyville, containing 200 well-built
uses of this class, which had never paid 4 per
nt. on the cost, the death-rate was only 11·52
r 1,000, and other districts worked out almost
favourably. He took a census of three kinds
artisans' dwellings, including 2,129 houses, and
habited by 9,819 persons. These he divided
to three classes, and found that the death-
tes for the past five years were 15·8 per 1,000 for
ntinuous back-to-back houses, 16·6 for back-to-
ack houses in blocks of four, and 17·0 for through-
uses, mostly built from ten to twenty-five years
go. He admitted that on no subject was medical
pinion more unanimous than in condemning these
uses, but he pleaded for an impartial re-examina-
on of the facts. A discussion followed, in which
e opinion was expressed that while through-
ouses commanded a higher rental than back-to-
ack houses, the sanitary advantages of the former
ore than compensated for the increased cost. The
enefits of a through-draught and the better venti-
ation which it insured were such that only those
who had studied the subject carefully could appre-
iate them.

CHIPS.

The Newcastle-on-Tyne Corporation have decided
o offer £500 for the best design for a new Town
Hall.

A stained-glass window, having as its subject
he Ascension, has just been placed in St. John's
Church, Wednesbury. Messrs. Hardman, of Birmingham, were the artsts, and the cost was £300.

Col. Luard, R.E., conducted a local government board inquiry, at the Town Hall, Waterloo, Liverpool, on Friday, into the question of granting the Waterloo Local Board power to borrow £1,350 for street improvements in the district.

The town council of Cheltenham have resolved to offer the Montpellier Gardens Company £7,500 for the gardens on the understanding that it includes the whole of the rights relative to the mineral water wells and waters, with the sole right to make and sell the salts manufactured by the company.

At a meeting of the archdeacons and the rural deans at the Old Palace, Lincoln, the Lord Bishop of Lincoln presiding, on Thursday, the 12th, Mr. J. C. Traylen, architect, of Stamford, was elected as ecclesiastical surveyor to the diocese of Lincoln.

A meeting of the Art Workers Guild was held in Barnard's Inn Hall, Holborn, on Saturday evening, to discuss architects from the artists' point of view, where, we understand, some plain speaking was heard, and many humorous points were made.

On Tuesday week the new church of St. Margaret's, Brotton-in-Cleveland, recently erected at a cost of £5,000, was consecrated by the Archbishop of York. The building is in the Fourteenth-Century style, and will accommodate between 400 and 500 persons.

Plans have been prepared by Mr. Richard K. Freeman, Manchester, diocesan surveyor, for entirely rebuilding, at an estimated cost of £3,000 to £4,000, St. Anne's Church, Lancaster. The present structure was erected in 1796.

At the White Horse Inn, Park-street, near St. Alban's, last week, Mr. C. T. Part gave a supper to the employés of Messrs. Boff Bros., builders, of Park-street, in whose hands extensive additions and alterations have been in progress for some time past at Alderman Lodge, Radlett, the residence of Mr. Part, under the superintendence of Mr. C. J. Ferguson, architect, of Carlisle and Westminster.

Our Office Table.

The city council of Manchester have recently rejected two sets of plans submitted to them by firms of architects for new buildings in Albert-square on the ground of excessive height, and also, in one case, that the elevation is not suitable in style and character to the locality. Both buildings were to be 90ft. in height, the one being for the Scottish Provident Institution, designed by Messrs. George Wadsworth and Son, the other also offices and business premises, Messrs. E. and F. Hewitt being the architects. The latter firm have agreed to modify their designs; but Messrs. Wadsworth have argued the point in a remonstrance forwarded to the local press, and to each member of the city council. They point out that the height is within that prescribed by the City by-laws; that Albert-square is extremely open, being 474ft. wide opposite this site; that the building would not interfere with the view from, or the lights of, the town-hall; and that no neighbour's rights would be interfered with. They further remark that lofty buildings are becoming more and more necessary in these days of rapid communication. It will be remembered that 90ft. is the limit to height below cornice level under the Amended Metropolitan Building Act of last session, while in Chicago it is proposed to allow a maximum of 180ft. In the latter city the Underwriters' Fire Association have just vetoed the erection of property exceeding in height one and a half times the width of street, by demanding an extra special insurance on such property.

Reading in *The Globe* of the water in house-pipes freezing, causing explosions and much discomfort, "An Architect" explains how easily and cheaply it may all be avoided. A screw-down stopcock is, or should be, provided at the point where the service-pipe from the water company's mains to cisterns enters the premises; immediately adjoining same, but nearer house, put a screw-down bibcock; before sundown daily, screw up stopcock, then open bibcock, and draw off all water remaining in the pipes. They will then remain empty until next day. In the morning, screw up bibcock, and open stopcock, when the company's water will at once enter the empty pipes and fill the cistern. Again, to prevent the water pipes freezing that supply house from cistern, put a stopcock in the pipe, or pipes, immediately at the junction with cistern, before retiring at night. Screw up stopcock, and draw off all water from the cold-water pipes. They will consequently remain empty until next morning, when open stopcock to fill the pipes. If the cistern is likely to freeze, a small oil lamp left constantly suspended close to the water will prevent it so doing.

The death is announced from Chicago of Mr. John M. Van Osdel, a well-known and successful example of the architect and builder, who has died at the age of four-score years. His father, James H. Van Osdel, removed from New York to Baltimore, where he was for many years a prominent architect and builder, and here John M. was born, July 31, 1811. When he was fourteen years old his father moved back to New York, and the boy studied geometry and architectural drawing, while working as a carpenter on his father's buildings. In 1831 he married, and returned to Baltimore, where he spent a few years as a contractor on his own account. In 1836 he went back to New York, and there received a commission from Mr. William B. Ogden to build him a house in what was then the small town of Chicago. This done, young Van Osdel found congenial occupation in constructing steamboats, then just invented. After spending a short time in New York asassociate editor of a scientific journal, he returned to Chicago, and opened an office as a regular architect. He was the first to exercise that profession in Chicago, and found uninterrupted employment. Many of the finest buildings in that city, such as the Palmer House, the Tremont House, the Oriental Building, the Reaper and the McCormick blocks, and scores of others in the city, the University buildings at Champaign, Ill., and Little Rock, Ark., and many others outside, were designed and supervised by him. He retired some years ago from active practice, but the busiest period of his life was that between his sixtieth and seventieth birthdays.

On the 26th ult. a deputation from the firm of McDowall, Steven, and Co., Milton Iron Works, Glasgow, waited upon Mr. Thomas Ferguson (who for many years had been manager to the firm mentioned), for the purpose of offering suitable presentations on the occasion of his retirement into private life (owing to failing health) after a long and uninterrupted service of nearly half a century. The deputation represented the financial, business, and travelling departments of the firm, and consisted of Messrs. Bathgate, Kelly, and Grimmond. The presentation included a pair of gold spectacles, also an umbrella and walking-stick, both silver-mounted and suitably inscribed. A very handsome silver cigar-case, with suitable inscription, was sent as a token of esteem by Mr. Alexander Ritchie, C.C., of the London House, Steven Brothers and Co., 4, Upper Thames-street, E.C., whose personal and business acquaintance with Mr. Ferguson is of over thirty years' standing. A somewhat lengthy notice of this latter firm and their products will be found in our issue of Jan. 2nd last year. The presentation was made by Mr. Bathgate, who said that all the donors regretted the cause of Mr. Ferguson's forced retirement after so many years' faithful and efficient service, and under whose personal superintendence and from whose plans the "Milton" had been erected. He had had the satisfaction of seeing them gradually develop and added to till they had become what they were at the present day—the largest of their kind in Scotland. These works would be a standing monument to his persistent energy, as well as to the universality of his genuis. Messrs. Kelly and Grimmond paid great tribute to Mr. Ferguson's excellent business and personal qualities, and in the course of a very appropriate reply, the latter said he thanked the donors for their very handsome gifts, and accepted them as a token of the goodwill and friendly feelings cherished towards himself by his late colleagues. His motto, he said, had always been to carry out, in spirit and in practice, the words embodied in his engagement Indenture, "I shall do all that lies in my power to further the interests of my employers."

A Bill deposited in Parliament provides for the incorporation of a new company with powers to construct a line from Whitecross-street, in the City, to Waltham Abbey, passing through Tottenham and Walthamstow. The capital of the company is set at £3,600,000.

Nanhurst, near Cranleigh, Surrey, the residence of Mr. Carbutt, M.P., is now approaching completion. The house was designed by Messrs. Johnson and Gibson, of Newcastle, in a Domestic English style of Renaissance, and its completion and decoration has been superintended by Mr. A. O. Collard, A.R.I.B.A., of Craig's-court, W.C., who has also designed, and is now superintending, the erection of stabling, gardener's lodge, coachman's residence, &c. The house has been fitted, in the more important rooms, with the electric light by Messrs. Drake and Gorham, of Westminster.

The memorials of Sir Walter Scott, preserved in the Advocates' Library at Edinburgh, have just received a valuable accession in certain documents that have been presented by the Marquis of Huntly. These papers are forty-seven instruments of credit, drafts, and promissory notes, all bearing as the signature of the acceptor the clear, regular, and clerkly subscription of Walter Scott. They bear dates ranging from 1819 to 1825, the period during which he produced most of his best works.

Major-General C. Phipps Carey, R.E., one of the Local Government Board inspectors, held an inquiry on Monday at the Town Hall, St. Helen's, Lancs, into an application by the St. Helen's Corporation for sanction to borrow £2,100 for works of water supply and £1,700 for the lighting and ventilation of the town hall and municipal buildings. Mr. D. M. F. Gaskin, water engineer, explained the plans of the water scheme, and Mr. G. J. C. Broom, the borough surveyor, those for the municipal buildings improvements. No opposition was offered.

A limited number of free studentships have been provided for workmen and boys associated with crafts and trades, who by these means may have an opportunity of acquiring a knowledge of drawing and modelling at the Westminster School of Art, held in the Royal Architectural Museum, Tufton-street, S.W., without any charge whatever. Candidates are preferred between the ages of 15 and 25 years of age. Those intending to apply for this really valuable chance of acquiring useful training and knowledge should do so at once, and particulars are furnished in our advertisement columns to-day.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business meeting. 8 p.m.
Leeds and Yorkshire Architectural Society. "The English Renaissance," by J. M. Brydon, F.R.I.B.A. 8 p.m.
TUESDAY.—Institution of Civil Engineers. Discussion on "Weighing Machines." 8 p.m.
WEDNESDAY.—Civil and Mechanical Engineers' Society. "Forced Ventilation by Compressed Air," by H. Coward. 7 p.m.
Society of Arts. "Spontaneous Ignition of Coal and its Prevention," by Prof. Vivian B. Lewes. 8 p.m.
THURSDAY.—Royal Institution. "Greek Sculpture in Relief," No. 1, by Dr. A. S. Murray, of the British Museum.
FRIDAY.—Architectural Association, Lyric Club. Concert at Mona Hotel, Henrietta-street, W.C. 7.30 p.m.

CHIPS.

It has been decided that a recumbent effigy of Dr. Harvey Goodwin, the late Bishop of Carlisle, shall be placed in the cathedral of that diocese, and £1,200 has been allotted to that purpose by the committee.

The reopening of St. Chad's church, Cheetham, Manchester, took place last week. The building has been repainted and decorated, the system of drainage improved, the high altar restored, the side chapels re-embellished, and the organ transferred from the chancel to the Lady-chapel, the total cost being about £1,000.

The monument unanimously decreed by the citizens of Malta to commemorate the 50th anniversary of Queen Victoria's reign has just lately been erected at Valetta. It is a marble statue representing her Majesty seated on a throne. It is of white marble, and was designed and executed by Professor Valenti, of Palermo.

Out of a large number of candidates, Mr. D. H. Roberts, Portmadoc, has been elected deputy surveyor and sanitary inspector for the borough of Conway. The appointment was rendered necessary through the selection of the surveyor (Mr. Farrington, C.E.) as the engineer in charge of the important Cowlyd water scheme, for which he furnished the plans.

Alterations have been made to St. Joseph's Convent, Wolverhampton, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

In the case of Francis William Abbott, of Milltown, Norwood, late of Barnstaple, builder, the discharge for bankruptcy has been suspended for nine calendar months.

Mr. Hugh Munro, at present superintendent of work at Fife-Keith, and formerly of the Hong-Kong dock, was on Monday elected superintendent of harbour works to the Aberdeen Harbour Commissioners in succession to Mr. James Pirie, resigned. There were 41 candidates.

The city council of Oxford have unanimously decided to grant the premium asked for by the Duke of Norfolk, for the erection of a statue to Cardinal Newman, in the Broad-street of that city.

Mr. W. H. Webber died at his residence in Buckingham-place, Brighton, on Wednesday week. Mr. Webber, who was in his 64th year, went to Brighton to act as manager to Messrs. Patching and Son, builders, a firm in which he ultimately became a partner. The partnership was dissolved about fourteen years ago, since which time Mr. Webber had carried on business as an oven builder.

Archbishop Tenison's throne, in the restoration of which the late Right Hon. G. Cavendish Bentinck, M.P., evinced an active interest, has this week been re-erected in Canterbury Cathedral, the site chosen for it being the south-eastern transept.

The restoration of the ancient Parliament House in Edinburgh Castle, which has been effected at a cost of £15,000, entirely borne by the late William Nelson, the well-known Edinburgh publisher, is now completed, and the ceremony of handing over the key of the restored hall by Mrs. Nelson to the Crown is to take place during this month. The restoration has been carried out under the direction of Mr. Hippolyte J. Blanc, of Edinburgh, who was also the architect for the restoration of the Argyle Tower at the castle, carried out a few years since, also at Mr. Nelson's expense.

The work of decorating the chancel of All Saints' Church, Leek, has been recently carried out by Mr. Gerald C. Horsley. The work consists of three parts—a diaper below the stringcourse, the painting above it, and the roof. The panelling of the sanctuary has been stained and gilded, to bring the whole into harmony.

Colonel Ducat, Local Government Board inspector, held an inquiry at Nelson, on Tuesday, into an application by the corporation of that borough for sanction to borrow £6,000 for the erection of police-courts and cells, £1,400 for the purchase of property for the construction of a thoroughfare connecting two principal streets, and £25,000 for works of private street improvements. The application was unopposed.

A new stone and marble altar has been fixed in St. Mary's R.C. Church, Cresswell Park, Blackheath, from drawings prepared by Mr. A. E. Purdie, architect, of Crownhill-road, Willesden Junction. The work was carried out by Messrs. Boulton and Co., of Cheltenham.

Holloway's Pills correct bile, prevent flatulency, cleanse the liver, and purify the system, renovate the debilitated, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reinstate the weak to an ardour of feeling never before expected. They are indeed a blessing to those who suffer from disorder, internal or external.

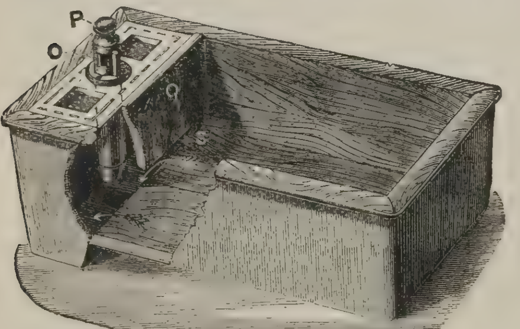
TIMBER MERCHANTS, IMPORTERS,
BROKERS,
TIMBER AUCTION MART,
44 TO 47, BISHOPSGATE STREET WITHOUT, E.C.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

JENNINGS' IMPROVED PATENT
COMBINED SINK and WASH-UP TUB.



THESE SINKS are specially adapted for Kitchens, Sculleries, Cottages, Artisans' Dwellings, &c., and are made of Galvanised or Enamelled Iron. Simply lowering the Standpipe P converts it into a Wash-up Tub, but in place of a Grating (so liable to become stopped) it is provided with a Slot S formed by the partition Q the whole width of the Sink, which allows waste water to flow freely away, but prevents small articles such as spoons, &c., from escaping into the drain. Lined with White Pine, it forms the best possible Sink for Butlers' Pantries, for washing China, Glass, and Plate, the breakage due to the employment of ordinary sinks being avoided. They are made of different sizes, and are clean, strong, and durable.

JENNINGS' PATENT HOUSEMAIDS' SLOP SINKS, in Plain or Enamelled Slate, to suit any position that may be required.

AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.
Illustrated Prices and Particulars Post Free on application to
GEORGE JENNINGS, SANITARY ENGINEER, STANGATE, LONDON.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXII.—No. 1933.

FRIDAY, JANUARY 22, 1892.

BRICK AND CONCRETE WORK.

THE rival claims of brick and concrete have to be regarded both from an artistic and a constructive point of view. We do not suppose that if all the restrictions and legal enactments bearing on concrete were removed, and if its manufacture and the facilities for using it were all that could be desired, it would ever supplant old-fashioned brickwork in the affections of the architect. The traditions of the past strongly cling to the older material. The idea of building with blocks of some form, of handling and disposing them, is so strongly engrafted in the mind of the architect with almost a kind of hereditary bias, that any plan of substituting another mode of erection for the traditionary handicraft is scarcely likely to be entertained. To the artistic mind, the instrumentality of the hand in giving form is more valued than a process which supersedes any manual skill. On this principle, all kinds of mechanical methods of performing handicrafts have been regarded with distaste if not with disgust, and among them is to be placed the mode of building by concrete on the frame or filling-in system. This system does not readily lend itself to architectural forms or details, such as those which can be formed in stone or brickwork. Projecting members and features having angles would necessitate moulds and frames of complicated structure, and these appliances would entail increased cost in labour. But there are conditions of employment which favour the use of concrete, and these are found in the construction of retaining walls, dock walls, breakwaters, storage reservoirs, and in the erection of buildings where continnous plain walling and apertures are required, as in warehouses and factories. We are speaking now more particularly of the "frame" method of construction, in which standards or patented appliances are used for incasing the concrete. For plain-sailing wall building, concrete is a material that must very soon take the place of brickwork as being more expeditious, and, where suitable ingredients can be found, more satisfactory and economical. One reason of the slow progress made in concrete construction is that architects have not yet fully mastered the subject, which has been too long in the hands of experts and patentees of appliances. In preparing plans for concrete buildings, it is absolutely necessary that the walls and cross walls with all the openings, windows, and doorways, chimney-jambs, &c., should be carefully figured by the dimensions; thus, the lengths of wall or piers between windows ought to be accurately stated, also the width of openings, so that the carpenter who fixes the frames and uprights may be able to place the standards and panels in the proper positions. These are technical details which are not required on brick buildings, but for the sake of economy, the plan of a concrete structure would be better arranged if it had some regard to the position of standards and the jambs of the openings. If piers at intervals are proposed, these should be spaced, and the wooden casings set out on the plan.

Other points have to be considered in the design and construction of concrete buildings: one is the expansion and contraction of concrete walls, which require that the frames or boards give sufficient room for play instead of being closely fixed to the standards. If we say the linear expansion of concrete is 1 in 2,365, or an eighth of an inch in 24ft.—as stated by Mr. Thos. Potter, a reliable authority—it is certainly proper to arrange that in long walls some means of compensation should be provided rather than that cracks or fissures make their appearance. One method suggests itself, and that is to have a few well-distributed external piers, and that at these, or a few of them, indents be formed, and a kind of vertical wood or iron tongue or "groove-and-tenon" arrangement, by which any contraction may be given freedom. The equal division of the wall by projecting piers—say every 10ft. or 12ft. apart—enables any contraction horizontally at least to be managed, and the number of vertical cracks to be reduced. These piers may be of brickwork, and a pleasing variety of colour thus be introduced. No doubt this drawback of contraction is one of the most serious; we think it is due as much to the matrix as the aggregate, though some authorities attribute the mischief to the latter component. Dycherhoff's experiments prove that expansion of cement takes place; we have also the practical evidence afforded by large pavings of concrete showing cracks, which proves that contraction follows the setting of the cement. With lime concrete, expansion and contraction take place in a much less degree, showing that the matrix is more yielding, for we have seen extensive retaining walls of this kind of concrete without fracture. Much of this cracking of concrete is due to the want of fine-grinding the cement, a quality necessary to the perfect surrounding of each particle of sand and aggregate, but which manufacturers are wont to undervalue, as finely-ground cement is less remunerative. Of course the aggregate should be clean, and of a kind not subject to undue expansion; hence furnace clinker or slag is probably the best.

These requirements, no doubt, have been found hard to fulfil; careful supervision of the cement and the mixing is required, and hence architects lean towards a mode of construction that is not so troublesome. Statutory provisions have also retarded the development of concrete construction in the Metropolis. The rules in force are those referring first to foundation and sites, where the aggregate is required to be of clean gravel, broken hard brick, burnt ballast, or other hard material to be approved by the surveyor, and to be used with fresh burnt lime or cement in the proportion of 1 lime to 6, and 1 of cement to 8 of the other material. A recent by-law makes it imperative that for walls the concrete is to be composed of Portland cement, and clean Thames or pit ballast, or gravel, or broken brick or stone or furnace clinkers with clean sand in the proportion of 1 part of cement, 2 parts of clean sand, and 3 parts of the coarse material, which is to be broken to pass through a 2in. ring. The thickness of walls to be equal to that of brick walls prescribed by the 12th section of the 1st Schedule for brickwork. These by-laws are obviously necessary to insure uniformity, and to promote good construction, but builders and architects who have methods of their own have felt them to be irksome. The by-laws in force in the provinces appear also to have rather favoured other materials. As regards cost, opinions differ. Comparing it with brickwork, it may be said to be cheaper when it is used in bulk, and for great masses like quay walls, warehouses, and foundations, and it may not be far wrong to say that, for large mass work, the cost is 50 per cent. less. Of course, every kind of skilled labour, in casing, frames, standards, or in cores, reduces this percentage, till in ordinary buildings, like cottages, the difference is problematical. Architects often ask the question, but the answers they get are various, and depend on conditions. Generally it may be safely stated that unless a large number of houses of plain character, and being a repetition of the same design or details, is to be erected, the cost of concrete would be rather more than less that of brickwork, especially if cheap and suitable material for an aggregate is not at hand. This last condition is as important as repetition and quantity.

As an example of the engineering value of concrete in large masses, we may mention the fact that the engineer of the new drainage scheme of Melbourne has given his opinion of the advantages of concrete. The question whether they shall be of brickwork or concrete has been the subject of a long report, which has been submitted to the Board of Works of Melbourne by Mr. W. Thwaites, the engineer-in-chief of the Board, in which the relative merits of each material are discussed. When we consider that the total length of the main sewers of that city will be 200 miles, the importance of the material becomes evident. Mr. Thwaites enters into this question by comparing the strength and stability, and the relative cost of these rival materials. He refers to Mr. Grant's series of experiments on Portland cement for the Metropolitan Board of Works in 1858, and the specification for the southern high-level outfall sewers. The resistance to crushing of the superior bricks of Melbourne when laid in neat current is shown to be 133 tons to the square foot. Professor Unwin's experiments on London stock bricks and neat cement give 103 to 177 tons; gault wire-cut bricks and cement, 181 to 237 tons. But these figures are for bricks laid in neat cement. In mortar of three of sand to one of cement, experiments on stock bricks show an average strength of 160 tons per square foot. To prove that mortar made of these proportions has a greater crushing resistance than ordinary stock brick, it is found that a brick made of mortar of one of cement to four or five of sand is equal in strength to the best stock brick. These results are corroborated by tests made on Portland cement concrete for the embankment works on the Watts River, Victoria.

The artistic aspect of the question may be quickly dismissed. When concrete can be used in mass or in bulk in foundations, walling, piers, or for filling-in to walls and floors, there is a strong claim to be made for its use. The construction of vaults and roofs is one of the many ways, we think, in which concrete may be employed with decided advantage, as it can be easily lifted and filled in on light centring or ribs. Brick vaults are costly in cutting and working the groins, and in forming templates and bevels, and even then they exercise a more destructive thrust than a concrete vault. Mr. Gribble adopted concrete in the great domical vaulting at the Church of the Oratory at Brompton with successful results, and for mosaic or decorative treatment it has many decided merits of its own. There is one other direction in which concrete may be employed for plain buildings, and that is in the form of facing blocks, to make an outer casing for filling in, and in these two directions we think architects have possibilities before them.

THE SOANE MEDALLION AND OTHER PRIZE DRAWINGS.

THE subject proposed for competition for the Soane Medallion and £100 was a chapter-house, to be placed on the east side of the cloisters of a cathedral, and approached from them. No style was given. One of the best set of drawings is that of a "Cherub" in a shield, accompanied by a well-drawn India-ink perspective, for which a medal of merit is given. The author is J. Begg, A.R.I.B.A., Bloomsbury. The author shows an hexagonal chapter-house, surrounded by an ambulatory, obtained within the depth of the angle buttresses. There is a cloister approach and vestibule. The style is Gothic, of a Late French or Burgundian type, and in the contruction the author introduces the traditional central shaft, with radiating ribbed, groined roof, the ribs of stone, with red-brick web vaulting. Some very nice detail is shown, and the drawings are cleverly executed. The same shape of plan is adopted by "Plume," the author of which has ingeniously made his angle buttresses triangular in plan, the external angle projecting beyond the face of upper masonry, and terminated by weatherings below the window-level. The moulded members of the arched windows die away against the splayed sides of buttresses. On the upper level of chapter-house they assume the hexagonal form. Careful plans at pendentive, groining, crypt, and roof levels are sent; the style is Late Gothic, with crocketed arches. The hexagonal pinnacles are more ingenious than beautiful.

"Abbotsbury," an able set of designs, shows an octagon chapter-house surrounded by a low aisle-like cloister walk, with apsidal recesses to the sides. A cleverly drawn pencil and shaded Indian-ink perspective is sent. The style is of Late Decorated character, with central pendant to vault. The author, Mr. Heber Rimmer, Chester, takes the Soane Medallion.

"Anno 1891" is the motto of a design which, but for its affected display of archaic Mediævalism in the ink perspective, has talent. The plan chosen is circular, with eight apsidal recesses between the piers, which are strengthened by flying buttresses some distance from the wall. Circular angular piers with conical spirelets accent the external angles of chapter-house, and some clever Early English detail is shown.

"Byzantium" is also an elaborate and richly-coloured mosaic encrusted design, based on Byzantine types, a Greek cross, with domical centre and semi-dome apses. A rather clever design in the Italian style is that with "Griffin" in square, an octagonal structure covered by a dome and internal cupola, the sides pierced by narrow windows, and having a deep carved frieze under cornice. The decoration internally is by frescoes and mosaics. The drawings are slightly tinted. "Sun" and "Ex-Cathedra" are of more commonplace design, the latter very heavy and without a visible roof.

The Tite Prize designs for church steeple, 35ft. square and 250ft. high, are four in number, and show a dearth of ideas. One of these is "Design in Circle," which takes a medal of merit—a massive and well-proportioned tower, surmounted by a square clock or belfry stage, with pyramidal obelisk or spire termination. We do not like the window treatment of the lower part of tower, and the perspective gives the effect of an oblong, rather than a square. "Ashlar" is an attenuated version of Bow steeple, and "Red Lion," to which is awarded the Tite prize, by Mr. G. R. Kitsell, A.R.I.B.A., has a broken octagonal belfry, with spire springing from corner consoles on a rusticated square tower, while "Quis" is below par. Why is it that this yearly competition has so fallen, or that more talent could not have been enlisted? The principles of Bramante, Palladio, or Sir W. Chambers have scarcely been followed, and even Wren has been travestied.

The Measured Drawings Medal and £10 10s. has been responded to by only three candidates. "Nito" is the motto of a carefully-drawn and measured set illustrating George Heriot's Hospital, and is by Mr. R. J. Balfour, Gower-street, who receives a medal. "Pollux" is a set of drawings and details of Castor Church, Peterborough, an interesting structure with Early Norman tower over the crossing, and with Early English and Late Gothic features. "Black Spot" is the motto of a set of drawings of St. Mary's Hospital, Chichester. These subjects are, however, scarcely equal to the expectations. One of the Colleges of Oxford or Cambridge, or some of the monasteries and churches suggested in the list to competitors—such, for example, as the Lady-chapel, Wells Cathedral, or St. Cuthbert's Parish Church, Wells, would have had greater architectural value. The Pugin studentship also, from the conditions of the competition, might have been better represented. We see many drawings and sketches that have before been exhibited, those of Detmar J. Blow, who wins the Studentship, comprising many beautiful coloured and plain sketches from Troyes, Abbeville, Allonne, Dijon, and Beauvais Cathedral, possess considerable merit and interest. Many of them have a Ruskin-like character and feeling, and the huge scale drawings of plan and section of the chapel of St. Joseph, Beauvais Cathedral, have a value of their own. Erskine S. Cummings sends a splendid collection of pencil drawing of sharp accentuated touch, including studies of Dryburgh Abbey, interior of Beverley Minster, Lincoln, Peterboro, Ely, and Durham cathedrals, and of Skelton church. Chas. R. McIntosh sends some colour sketches of doorway at the Certosa, Pavia; and from Santa Croce, Florence; Palermo, Venice, &c., and pencil sketches from Elgin, Glasgow, and Linlithgow. Chas. A. Nicholson's pencil drawings (which take a medal of merit) and coloured sketches of Long Melford and Wisbech churches, Lincoln Cathedral, and the roofs of St. Stephen's, Norwich, and St. Margaret's, King's Lynn, and Wymondham, and the pencil sketches of Percy D. Smith are to be noticed.

The Grissell Gold Medal is represented by only three competitors, for a design for a stone railway bridge, of one span of not less than 150ft., across a river between deep banks. The design, "Jacta est alea," awarded the medal, is accompanied by diagrams showing method of finding centre of gravity of half-arch and surcharge, line of pressure, &c. "Equilibrium" shows vaulted cells constructed above the arch, filling up the spandrelling. Another design, "Fundamentum forte opus sustinet," is also illustrated by diagrams. The drawings for the Scientific Masonry Prizes only comprise two sets, "Saxum" and "Voussoir," for an octagonal turret stone vaulted. The vaulting rests on the exterior walls and a central newel of stairs. A model accompanies the former motto. Drawings are also sent by C. K. Greenslade, of St. Peter Mancroft, Norwich, and Lincoln Presbytery, &c.

The following are the names and addresses of the winners of the Soane Medallion and Institute Silver Medal and other prizes:—

Soane Medallion, design "Abbotsbury," to Mr. Heber Rimmer, Chester. Medal of Merit to "Red Cherub," by Mr. J. Begg, A.R.I.B.A., Bloomsbury.

Pugin Studentship awarded to Mr. Detmar J. Blow. Medal of Merit to Mr. Chas. A. Nicholson.

Tite Prize awarded to "Red Lion," by Mr. G. R. Kitsell, A.R.I.B.A., Bloomsbury. Medal of Merit to "Design in a Circle."

Institute Silver Medal to drawings of Heriot's Hospital, by Mr. R. J. Balfour, Gower-street. Medal of Merit to Mr. Percy D. Smith.

Grissell Gold Medal ("Jacta est alea") to Mr. H. Harland, Brighton. Masonry Prize, £6 6s. to ("Saxum"), Mr. H. S. Wood, A.R.I.B.A., Beckenham. Prize of £4 4s. to ("Voussoir"), Mr. E. S. Cummings, Battersea.

The Godwin Bursary: Locke Worthington, A.R.I.B.A., of Queen Anne's Gate, Westminster, for his drawings, books, and particulars for the study of Model Dwellings of Paris.

Institute Silver Medal Essay on Fireplaces: Chas. E. Sayer, A.R.I.B.A., Soho-square. Medal of Merit to Richard Glazier, A.R.I.B.A., Manchester.

THE ACTION OF HEAT FROM OPEN FIREGRATES, STOVES, AND HOT-WATER PIPES.—II.

By F. Dye.

In the last paper it was explained that an open fire heated the objects near it by radiant rays of heat, and this heat was re-radiated about, and also transferred to the air by contact with the warmed objects. The re-radiation and the convective action of the air ultimately distributing the heat about the room where the first direct rays did not reach. It will be seen from this that the greatest source of heat is the primary radiant rays from the glowing fuel, next the secondary rays (re-radiated from warmed objects), and next and least, warmth imparted to the air by contact with warmed objects. Now, this order of precedence is the great feature of the open grate, it heating a room chiefly by radiant heat, and least by warming the air.

All authorities agree that the plan of heating most conducive to health is to provide a fully sufficient heat to the body, but at the same time to have a cold or cool air to breathe. This can be proved in many ways; for instance, by the ease or actual pleasure with which we can breathe the wintry air, provided the body is warmly clothed (and in health). It might have been more plainly stated earlier that radiant heat possesses the peculiar property of passing through air without increasing its temperature, and only heats objects that it strikes or comes in contact with. It is sometimes a little difficult to grasp this, but the common instance adopted by writers to prove its accuracy is to refer to the atmosphere at some distance from the earth; the atmosphere in high regions is always exceedingly cold (as snow-capped mountains prove), yet these high regions are nearer the sun, the source of heat, than the general surface of the earth is. The sun's rays have no warming effect upon the ai however hot they may strike persons or object upon the ordinary surface of the earth.

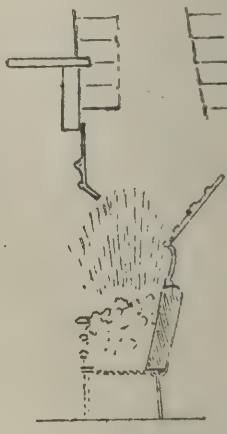

FIG.3

Now, in addition to the fact that the ope grate contributes heat to a room by the mos natural way possible, it has two other good features: first, the cheerful appearance of its fir cannot be overvalued. This one feature is sufficient cause for its still being in favour, without the other advantage just given. In fact amongst the general users of the open grate it hygienic value is not known, and the pleasure tha the sight of the fire incites gives it preference ove other methods of heating. Secondly, there is n more effective (non-mechanical) ventilator tha the open fire-grate. The chimney, with its wid opening into the room, is a most effective fou air extractor, and cause of fresh air inlet. Thi can be instantly proved by holding the hand t the crevice of a door or any point where air ca find an entrance, and a keen inrush of air wi be instantly detected. This inflow of air wholly due to the up-draught in the chimney Let the fire go out, and then close the chimne opening (the register flap), and the draug through the crevices will disappear.

There is no denying that the average grate not capable of giving the effective results th other methods of heating can, and neither do w under any circumstances get such a regular controllable temperature, but, notwithstandin this, the open grate exists, and its existence bea no signs of being terminated, for the improvements introduced of late years have as nearly as possible quite obliterated some of its ill features.

The first attempts in this direction were made with the view of checking the speed at which the fire burnt, and the outcome of this is the many forms of open fire "slow combustion" grates now to be obtained. This is a most desirable improvement, for with the old pattern grates the fire burnt unnecessarily fast when it had once become bright, and the great heat evolved went partly up the chimney, and partly to make the heat of the room too great. This was the usual result. With the modern grates the speed of combustion is greatly reduced, and when the fire is bright it remains so for a longer period, giving out a regular heat and other satisfactory results, with a lessened quantity of coal.

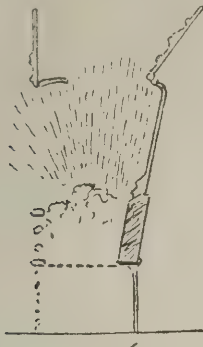

FIG 4.

This is excellent as far as it goes, but some of these grates have the disadvantage of being slow burning at all times, and a slow rate of combustion is a positive source of annoyance when the fire is first lighted, or at any of the times that it may be required to burn up quickly. The fire should, to secure the most agreeable results, be convertible from slow to fast burning, or the reverse, as required. Most grate makers now provide for this in some way or the other, more or less effective.

The next chief improvement effected with the open grate to render it more capable was to prevent such a lavish proportion of the heat passing up the chimney. With the old and common forms of grates there appears to have been an effort made in design to permit of the freest possible escape of smoke and products of combustion into the chimney without regard to the free escape that was thus afforded for heat and such valuable effects. The form known as the "register" grate, with semi-circular flap at back just over the fire, is in section like Fig. 3. Another pattern, usually with hobs, is as Fig. 4 (also in section). In these it will be seen that the castings forming the backs are intentionally made at an angle to give the easiest passage for the products from the fire to the chimney, and the small lines show what a great proportion of the radiant heat is projected into space where it has no useful effect. In quite the majority of open grates the backs, whether iron or firebrick, are made to slope away back from the fire, and this has been found to be totally opposed to good results so far as heat distribution into the room is concerned.

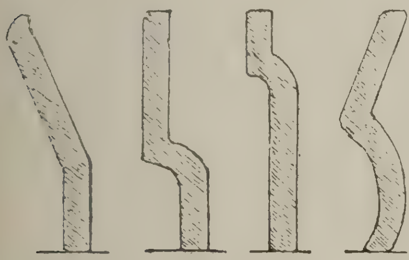

FIG. 5. 6. 7. 8

All modern pattern grates are now furnished with the firebox wholly composed of firebrick (excepting the grating bottom and front bars), and in practically every case the back brick is made to overhang the fire in some way or other. It may be that it gradually slopes forward, or it may project over abruptly at some point. Figs. 5, 6, 7, 8 show some of the forms given these bricks, but hardly two makers have their bricks alike, and each, of course, claims some effective superiority over the other. If we take a brick, as Fig. 5, for example (it is an effective brick, and one that an explanation can be given to simply), the more satisfactory heat in the room is brought about as follows: It must first be explained that radiant heat can be deflected, *i.e.*, turned from the direction it was pursuing, by encountering an object placed at a not too abrupt angle, even if this surface that it encounters be the reverse of polished. It acts in the same way as a beam of light would if it was directed against a mirror placed at an obtuse angle. The light would be caused to take a different direction or line to that which it pursued previous to its reaching the glass. The result of the overhanging brick is, therefore, first, the prevention of heat rays passing into the chimney; secondly, the projection of these particular rays into the room, as Fig. 9.

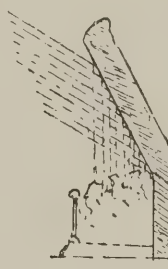

FIG. 9.

The next and as great a gain effected by the brick overhanging the fire is the utilisation of flame heat, a valuable source of heat wholly and utterly wasted otherwise. Flame, for all practical purposes, may be said to heat by contact only. Everyone knows what a little heat is radiated or dispersed from a flame. The hand may be held quite close to it without great inconvenience, but let the hand be just put into the flame (the flame have contact with the hand) its effectiveness is then manifested most obviously. If flame has contact with anything it will contribute heat to it unsparingly (as in a reverbatory furnace), but without contact it will do but very little work.

We have an excellent example of this with the modern forms of gas fires, the source of heat with these being flame pure and simple, and the flame by itself would be very ineffective, but it is made to impinge upon and to heat a firebrick and some hollow balls of an asbestos composition, and by making these of a bright red heat the stove is rendered a success. If we suddenly turn off the gas when one of these stoves is at a bright red heat we shall find that for a moment there is about as much heat radiated from the red-hot materials as when the gas was alight, showing that the gas flame itself contributed but little to the radiant rays of heat which are the cause of the room being heated.

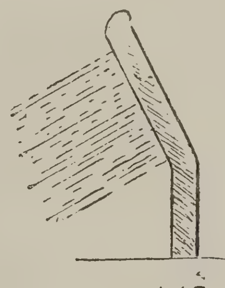

FIG. 10.

From this it will be seen what a valuable use can be made of the flame from a coal fire by causing it to impinge upon the back brick, this being effected by the brick overhanging the fire. We do not get the brick at a bright red heat, as in a gas stove, but it gets most intensely hot when the fire has been alight a little time, and then it sends its rays of heat into the room most freely and successfully, for the rays are projected in a downward direction towards the floor, as Fig. 10.

It is peculiar to note what a number of advantages are gained by having the back brick leaning over the fire. This projection of heat rays towards the floor is a really valuable one. If we succeed in furnishing sufficient heat to the floor of a room, the air which becomes heated by contact, and rises by its convective action, quickly makes the upper part of the room warm. Grates are now made with the fires as near the hearth as possible, chiefly with this object in view. It is easy to imagine what a difference there would be in heating a place with hot-water pipes if we put the pipes up near the ceiling instead of at or beneath the floor. It is doubtful if the place would ever get warm under these circumstances if any effective means of ventilation existed.

The overhanging brick thus sends out heat in two directions at once, that by deflection as Fig. 9, and that by radiation as Fig. 10, both these effects being of a pronounced successful character, and both being results not attainable with the ordinary or old pattern grate already referred to. It may be added that the overhanging brick assists materially in reducing the volume of smoke that would otherwise pass directly into the chimney, and smoke is nothing more or less than unconsumed fuel.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meetings of the Association were resumed on Friday evening. There was an unusually small attendance, and in the absence of the President, who was out of town, and of the Vice-Presidents, both of whom were laid up by the prevalent epidemic, Mr. LEONARD STOKES, Past President, was called to the chair. Donations to the general fund were announced of five guineas for five years from Mr. T. M. Rickman, and of £100 a year for three years from the R.I.B.A., the latter gift being acknowledged by a special vote of thanks from the Chair. Messrs. J. Aldridge and J. E. Van Abbott were elected as members. A vote of condolence with the Prince and Princess of Wales in their bereavement was proposed from the Chair and agreed to, the members silently rising from their seats to testify their acquiescence.

THE DESIGN AND EQUIPMENT OF TECHNICAL SCHOOLS AND COLLEGES.

Professor GARNETT, of Newcastle-on-Tyne, read a paper on this subject, illustrated by plans, sections, and elevations of the Durham College of Science, at Newcastle, now in course of erection in instalments from designs prepared by Messrs. Johnson and Rich of that city. In his preliminary observations the lecturer suggested that it is desirable that the chief technical teacher, and sometimes two or three other members of the staff, should be appointed at the same time as the architect for a proposed technical college. It should be the duty of the teacher, as soon as he is appointed, to advise the governing body with respect to the accommodation required in the several departments, the relations of these departments to one another, and the special appliances required in each. Attention should be specially directed to the relative positions of the rooms devoted to the several departments, so that while each department forms by itself a compact whole, it should be contiguous to other departments to which it is, in the character of its work, most nearly akin; that the appliances of each department may be available to those students and teachers in other departments who are most likely to require their use. For example, a photographic laboratory should be situated as near as possible to the chemical laboratory on one side and the art studios on the other. For similar reasons the metallurgical laboratory should, if possible, be placed between the departments of chemistry and of mechanical engineering, so that all facilities for chemical analysis may be readily accessible on the one side, and testing machines for the systematic examination of the mechanical properties of the metals and alloys may be equally available on the other. On the same principle, the department of electrical engineering should adjoin the engineering laboratory and workshops, for the double reason that steam-power may be available, and because every electrical engineer must be at the same time a mechanical engineer. Students of electrical engineering must also have ready access to the physical laboratory; but it is not desirable that the engine and dynamo-room should be geographically near to the physical laboratory. But while it is desirable that the relative positions of the several departments should be carefully chosen, it is of paramount importance that each department should be compact in itself, so that its work may be conducted by the smallest number of superintendents. The private room of the Professor of Chemistry should be as near as possible to his students' laboratory; if it communicates directly therewith a further advantage will be gained, and his preparation-room should adjoin the laboratory on one side, and his lecture theatre on the other. It very frequently happens that it is not possible to erect at first the whole of the buildings which it is intended ultimately to provide, and the question then arises whether a school or college complete in all its departments should be erected on a small scale, or whether plans should be made for the whole building, as though it were intended to erect the whole at once, and a selected position, representing certain departments only, should be built at first. There is, of course, some inconvenience attending the latter course, pending the erection of the remaining portions of the building, but this inconvenience may be made comparatively small by a careful selection of the departments for which provision is at first to be made. If the former method is adopted, the institution will be complete in itself during the early years of its existence; but when the enlargement is carried out several departments will be partly located in the old and partly in the new buildings, and the conduct of the work of each department will be rendered difficult and expensive. In selecting the departments for which provision should be made at first, it is best to commence with the departments of chemistry, physics, applied mechanics, engineering, and fine art, erecting these departments as completely as the character of the plan for the whole building necessitates. As regards the position of the several departments, it is desirable that in any institution in which popular lectures or any large evening classes form an important feature, there should be a large lecture theatre, as near as possible to the public entrance, and that it should be on the ground floor. This lecture-theatre may be common to several departments, but should be readily accessible from the physical department, as physical apparatus is likely to be very largely used in the theatre, and such apparatus is often very ponderous or very delicate. In this theatre as much length as possible should be given to the lecture-table. For a theatre capable of holding two or three hundred persons a lecture-table 30ft. by 3ft. is not too large, and 3ft. is a convenient height. The table should be carried on its own foundations, the supports being entirely distinct from those which carry the floor, so that any movement of the audience may not disturb the most delicate apparatus on the table. It is generally best to carry brickwork for the support of the table up to within two or three inches of the floor level. The space beneath the table and within the brick wall should be accessible from the lecturer's side, as it may be usefully employed to accommodate resistance-coils and other accessories of the lecture-table. The floor should be carried on walls built a foot or more away from the wall which carries the lecture-table. In the Cavendish Laboratory at Cambridge the lecture-theatre is on the first floor, and the lecture-table is an oak slab carried on an 18in. wall, which forms one wall of the gateway, the floor being carried on brick piers erected for the purpose, a few inches away from this wall, and this arrangement may be desirable when it is impossible to find accommodation for the lecture-theatre on the ground floor. As much space as possible should be left behind the lecture-table for such apparatus as cannot conveniently be placed upon the lecture-table itself, as well as to give a reasonable length for a beam of light reflected from the mirror of a galvanometer or other instrument on the lecture-table, and observed by the audience as it traverses a graduated scale on the wall behind the lecturer. 8ft. is not too much space to leave between the lecture-table and the wall. The gas or other lights in the room should be controlled by a valve or switch fixed underneath the lecturer's table, and readily accessible to the lecturer. Another important adjunct to a lecture-theatre is a platform for the magic-lantern, which, like the lecture-table, is entirely independent of the floor of the room or of the gallery supports. A hollow brick pier standing on its own foundation, and carried up through the gallery without coming in contact with the seats or floor, forms a very convenient support for the lantern. Gas, bottles, and other appliances may conveniently be stored within the pier, and, if an electric lantern be used, the conductors may be brought up from the basement and through the pier, and regulating resistance fixed within the space inclosed by the brick walls, which form an almost fire-proof structure. The windows should be arranged in order to throw the greatest possible amount of light upon the lecture-table, but the room should be capable of being darkened completely. If possible, openings should be made in the ceiling directly over the lecture-table, through which apparatus may be suspended at any height above the table from the floor above. A water-supply and sink should be within easy reach of the lecturer, and a large fume-closet with glass front should be fixed in a position in which the audience can readily see its interior. A chamber heated by a steam-jacket, and provided with a glass front, is a very valuable accessory to a lecture theatre, as it enables electrical and other apparatus to be kept warm and dry and in working order, whatever may be the state of the weather or the hygroscopic condition of the overcoats of the audience. In the Physical Lecture Theatre, at Newcastle, the seats have been so arranged that any person can see the front edge, and therefore the whole top of the lecture-table over the head of a person who, when sitting down, is $2\frac{1}{2}$in. taller than himself. This condition gives a slightly concaved profile to the seats; but the steepness of the gallery is rapidly reduced if the distance between the lecture-table and the first row of seats is increased. It is only when the length available for the theatre is so small that the seats have to be brought very near to the lecture-table that the gallery becomes inconveniently steep. It is imperative that the principal laboratories in the physical department should be upon the ground floor, and that there should be no basement story below them. At least one room should be set apart for exact measurements in electricity and magnetism. The chief tables in this room should be of slate, carried on brick piers, which are built from their own foundations independently of the floor. Professor Ayrton has found it convenient to place slag wool between the brick piers and slate slabs, instead of fixing the slate to the piers by cement, but the risk of vibration being communicated to the instruments depends greatly on the nature of the soil in which the foundations are placed, and on the character of the traffic in the neighbourhood. Other things being equal, that side of the site which is most remote from the public thoroughfares, or traffic of any description, should be selected for the physical laboratory. The side tables throughout the physical department may be conveniently suspended from the walls. A plate of pine 6ft. or 7ft. in height, 6in. wide, and 2in. thick, is fastened to the walls by ordinary engineers' bolts, made of Muntz metal, which screw into sockets made of brass or Muntz metal, and built into the walls. Except in the neighbourhood of the electrical room, iron screws may be employed instead of brass, provided they are carefully protected from rust during the erection of the building by tar, or white lead and tallow. The plates of pine terminate a little above the floor, and to them are mortised brackets suitable for carrying the slab of teak or ash which is to form the table. By this means we not only secure a table with supports independent of the floor, but for a height of 3ft. or 4ft. above the table we have wooden plates, to which shelves or instruments can be attached without interfering with the walls, which in a physical laboratory may with advantage be of bare brick, provided its surface is smooth and hard. With the supports described, and with socket-screws built into the walls in positions suitably chosen, it will generally be found unnecessary to make any other attachments to the walls whatever. In the general physical laboratory gas and water should be provided, and, if possible, a fume-closet. If the building is heated by steam, a few T-pieces, by which flexible tubing can be connected to the heating-pipes, will enable steam at a pressure of 3lb. or 4lb. per square inch to be available for experiments in calorimetry and other branches of physics. When the physical laboratory is on the ground-floor, ordinary wooden tables may be conveniently carried on brick piers, 9in. or 14in. square, carrying stone caps only 6in. square, which project through the floor without touching it, and form supports for the table-legs. The brick piers carrying the tables should stand on foundations independent of those of the dwarf walls which carry the floor joists. When the physical laboratory is on one of the upper floors, the table may be rendered to a certain extent independent of the floors by the contrivance adopted at the Cavendish Laboratory. Here corbels are fixed in the walls 1ft. below the ceiling, and on these rest beams, upon which are fastened blocks, which project through the ceiling and floor to the floor-level of the room above. These blocks support the table-legs, which are thus carried from the walls of the building; but as the floors are carried from the same walls, it is obvious that the tables will not be free from vibration which can be transmitted through a short length of wall. Tables mounted in this way are, however, immeasurably superior to tables simply resting on a wooden floor, and are sufficiently good for nearly all purposes, provided that the blocks on which the table-legs stand remain clear of the floor; but there is a great tendency for these blocks to twist and come in contact with the floor on one side, in which case the whole arrangement becomes practically worthless. In the physical laboratory there should be at least one stone slab, about 3ft. square, placed at the floor-level, but resting on a foundation of its own, so that a kathometer or other instrument may be placed upon it and may be unaffected even by the movements of the observer himself. If it is possible to arrange trapdoors in the floors above the physical laboratory, so that wires or threads may be suspended freely from the roof of the building, such contrivances will frequently be found useful; but where this is not possible, supports should be arranged in accessible positions as high above the floor as may be, either by means of cantilevers fixed to the walls by socket-screws or otherwise, or else by beams carried across from wall to wall. It is generally best to place the chemical laboratory on the uppermost floor, constructing it with an open roof, so as to give as much air as possible. Full descriptions of many forms of benches have been published, notably by Mr. Robins, in his work on "Technical Schools and Colleges," which is unique and invaluable. There are, however, a few points in connection with the fittings of the chemical laboratory to which attention may be directed, and in the first place it is desirable that the use of lead should be avoided as far as possible in the drainage of the benches. The benches themselves are best constructed about 5ft. wide, and of length determined by the dimensions of the laboratory, but so arranged as to give not more than 3ft. 6in. to a junior student, and not more than 4ft. 6in. to a senior student. The depth of the cupboards and drawers from back to front is such as to leave a space in the centre of the bench running throughout its whole length of sufficient width for a man to pass through. This space serves to carry the gas and water pipes and the drainage trough. The latter may be made of 1in. or $1\frac{1}{4}$in. red deal boards, jointed so as to form a V-trough about 6in. in depth. The trough is thoroughly caulked with a mixture of pitch and tar, put on hot, and this trough serves to collect the drainage from the sinks and deliver it into a sludge-box or small settling-tank, through an overflow on one side. The overflow from the sludge-box is delivered into a similar trough laid in a chase in the floor, which conveys it to the down-comer outside the wall. In place of V-troughs, semicircular troughs cut from the solid in red deal may be employed. These semicircular troughs are largely used in chemical works, and avoid the joint of the V-trough. For the down-comer best stoneware pipes, salt glazed, may be employed, but cast-iron pipes coated with preservative compound will last a very long time, and some experiments will probably be made shortly upon the stability of enamelled cast-iron pipes for this purpose. Rectangular troughs have no advantage over V-troughs, and only offer a much larger surface for the acid liquids to act upon. The chases in the floor, which may carry gas-pipes, water-pipes, pipes for distilled water, compressed air for the blowpipe, and vacuum for filtration purposes, in addition to the drainage troughs, should admit of being opened throughout their whole length for the purpose of inspection. Fume-closets are generally more conveniently placed upon the walls than upon the working benches, and this arrangement simplifies the removal of the fumes without incommoding the laboratory with exhaust pipes to the ventilating shafts. Special fume-closets should be provided in the walls for the conduct of evaporations which occupy much time, and in these closets both gas and steam should be available for heating purposes. The water-supply to the benches should be at a low pressure. Ten pounds on the square inch is more than sufficient, and ⅜in. taps are quite large enough. In many laboratories it is necessary that the same benches should be used by two different students at two different times. In such cases the bottle-racks should be sufficiently large to accommodate two sets of re-agents, and each set should be provided with a locking-bar or frame, so as to be available to only one student, who will then be solely responsible for their purity. The balance-room is an essential appendage to the chemical laboratory, and, while readily accessible therefrom, care should be taken that it does not communicate directly therewith. The chemical laboratory and the balance-room will generally be on the first or second floor, and in that case the balances should be carried on the walls by brackets. If a separate sulphuretted hydrogen chamber is provided, it should be as far as possible from the balance-room. A separate room should, if practicable, be set apart for gas analysis and for other operations which require the use of considerable quantities of mercury. The floor of this room should be of asphalte, in which a shallow channel of circular or other convenient form is made for the purpose of collecting any mercury which may be spilled, and conveying it to an iron receptacle, whence it is collected and redistilled for future use. When mercury is spilled on a wooden floor, unless the joints are exceptionally close, a very large portion is lost, and accumulates between floors and ceilings. It will generally happen that the same lecture-room will have to be used by several departments; but it is very desirable that separate lecture-rooms should be provided for the departments of physics and chemistry, though each of these rooms may be used for lectures on any other subjects. For lectures on chemistry and physics a large amount of apparatus is frequently required, and sometimes it is desirable that the same apparatus should remain properly adjusted on the lecture table for several lectures in succession. This is notably the case with galvanometers and electrometers, some of which require much time for their adjustment. The engineering laboratory and the principal workshops must be on the ground, and, when land is available, they are best placed in a one-story building, with a "ridge and furrow" roof, separate from the main structure, but communicating directly with it. When it is necessary to place the engineering laboratory and workshops on the ground-floor of the principal building, the floor above should be of concrete, and the principal shafting should be carried on A frames, or other supports independent of the structure of the building. The engineers' drawing-office should be readily accessible from the workshops, so that the superintendent of the department may supervise both, as it will not generally be possible, or even desirable, to employ separate staffs of teachers for the drawing-office and workshops, though in commercial works the drawing-office staff is clearly differentiated from the shop foremen and managers. The biological department may with advantage be located on the highest floor, so as to command the best possible light and ventilation. A good range of windows on the north side coming within 3ft. of the ground is, perhaps, the chief desideratum in a biological laboratory. Sinks, a good water-supply, and tables which are strong enough not to yield to the pressure of the hand, because perfect steadiness is required for microscope work, with gas connections for table-lamps on every table, are also important desiderata. The uppermost story is specially fitted to meet the requirements of the department of fine art. An open Mansard roof constructed with steel principals, which are stiffened by gusset stays so as to avoid the necessity for tie bars, which might throw a shadow on a chart, seem most suitable for roof construction in this department. Lastly, with regard to the general arrangements of the building, a corridor of ample width should be carried on the ground floor throughout the whole length of the building, but in many cases through corridors will not be necessary on all the floors, provided that there are sufficient staircases to allow ready access to each department. It is difficult to carry corridors through a building on every floor without interfering with the access of light to the rooms, and in order to permit of the lighting of the rooms from both sides it is sometimes worth while to dispense with the through communication. In the college at Newcastle the first and second floor corridors extend for only one-quarter of the length of the building, so that the chemical laboratory and adjoining rooms, the physical lecture theatre, the apparatus rooms, the first-floor physical laboratory, and the optical laboratory occupy the whole width of the building, while the through corridor on the ground floor is built like the side aisle of a church as an annexe to the main building, but the roof being a lead flat and the corridor only 9ft. high, while the ground-floor rooms are 16ft. 6in. high, it has been possible to construct windows above the roof of the corridor to afford a cross light to the ground-floor rooms. When steam-power is required in the workshops or laboratories, it is most economical to employ low-pressure steam for the heating of the building, and to adopt engines which admit of efficient working with a back pressure of 4lb. or 5lb. per square inch on the exhaust, so as to enable the heating-pipes of the building to be employed as a surface condenser. If the building is lighted by electricity, the utilisation of the exhaust steam becomes an important consideration, as when the whole of the building is lighted, the exhaust steam from the electric-light engines is about sufficient for the heating on a very cold day. For example, a room of a floor area of 1,200sq.ft., and 16ft. in height, may be brilliantly lighted with high efficiency lamps, by the expenditure of two electrical horse-power. To develop this amount of power by non-condensing engines of 20 or 30 horse-power, and of moderate efficiency, will require about 75lb. of steam per hour. A much greater efficiency may, of course, be obtained with larger engines, or with high-speed engines coupled directly to the dynamos, and specially constructed for electric lighting. Seventy-five pounds of exhaust steam in condensing and cooling in the pipes will give about 40,000lb.-centigrade units of heat, and this will raise about 10,000lb. of air through 16° C. This quantity of air is equivalent to 130,000c.ft., and the capacity of the room being only 19,200c.ft., the air might be changed about seven times in an hour, which is more than twice the frequency required for class purposes. The ordinary allowance of electric light is one 60-watt lamp for 64sq.ft. of floor, reducing the quantity of steam for such a room to rather less than 60lb. per hour. As the corridors and some other parts of the building do not require to be illuminated as brilliantly as the classrooms, and as the ventilation will be continued in many of the rooms when the lights are not burning, it will be found that if boilers are laid down for the supply of the electric-lighting engines they will suffice, and not be much too large for the heating of the building in cold weather. When the engines are not running, the heating coils will, of course, be supplied directly from the boilers through a reducing valve. It it is necessary that any section of the building should be heated by a low pressure hot-water system, and if steam boilers are provided for the electric lighting and steam-heating of the remainder of the building, it seems undesirable that a special boiler fire should be kept up for the one section, especially if that section of the building to be heated by hot water is remote from the boiler room. In this case the hot-water circulation may be maintained by a coil of steam-pipe carried through a tank to which the hot-water circulating pipes are connected, the tank being placed, like a circulating boiler, at the lowest level available, and the steam supplied from the main boilers and drained back to the hot well. For the conduct of steam-pipes, return hot-water pipes, gas-pipes, cold-water pipes, electrical conductors, and, with some systems of ventilation, of the exhaust air-shaft, it is desirable that a subway, or basement corridor, should be constructed throughout the length of the building. From this corridor access may be obtained to the space beneath the floors of all ground-floor rooms whose floors are boarded in the ordinary way. As to ventilation, it has been pointed out by Prof. O. J. Lodge that when the air is warmer than the walls or other objects in the room there is a tendency for the dust in the air to be deposited on the colder surfaces, and this is generally associated with an unpleasant feeling of "stuffiness." Hence, heating by heated air is a dirty method, unless steps are taken to cleanse the air before it enters the rooms. This may be done to some extent by causing it to pass through a sheet of water produced by a "spreader," but the method is somewhat expensive. Any attempt at filtering the air through wool or other material introduces an amount of resistance to the current which is practically fatal. On the other hand, if the incoming air is cold, and the room heated only by radiation from the steam pipes, it is very difficult to avoid currents of cold air, with the practical certainty that the inlets will be closed by the persons occupying the rooms. A compromise between the two methods leads in some cases to satisfactory results. By boxing-in one half of the steam pipes with wooden casing, and allowing air to enter through the walls beneath the windows, and to pass over the hot pipes, and thence diffuse through the room, the whole of the entering air may be suitably warmed, while one half of the steam pipes remains for the heating of the walls and furniture by radiation. If radiators instead of steam-pipes are used in the best rooms, care should be taken in selecting the type of radiator to see that the castings, if such be employed, are so designed that it is impossible for unequal heating to cause strains of such a nature as to produce fracture of the casting. If two terminals are connected by three or more tubes forming one casting, it is possible to arrange such a distribution of temperature as to necessitate the fracture of at least one of the tubes. If the castings are held together by light wrought-iron ties which are external to the steam-tubes, so that their temperature is raised very slowly, the ties are liable to be strained beyond their elastic limits during the rapid heating of the castings, and to require frequent screwing up in order to keep the radiators steam-tight. There are types of radiators in the market which avoid all these difficulties. With regard to the removal of the exhaust air, there is little doubt that mechanical ventilation is most effective, and air propellers of the Blackman type, driven by a gas-engine or electric-motor, have proved very successful, even when the air has had to be drawn through a couple of hundred feet of tubes. The propeller may be inserted in a wall at the top of the principal staircase, or in some other convenient position, and the corridors may be used as air-ways, the air entering the rooms as above described, and passing through the opposite walls into the corridor. The system, perhaps, offers the least resistance to the air-currents, and a large propeller, driven at a comparatively slow speed, will do its work without noise or vibration. An electric motor may be directly coupled with the fan, whatever its position, or the fan may itself be wound as a motor; but if a gas-engine is employed, the power should be transmitted by a belt outside the building. It is clear, however, that the chemical laboratory, or any other rooms in which the noxious fumes are produced, must be cut off from this general system of ventilation, and be treated specially. If it can be arranged to erect the boiler chimney-shaft within a few feet of the chemical laboratory, the exhaust from the fume-closets, as well as the general ventilation of the laboratory, may be carried into the shaft, at the cost of somewhat reducing the steaming power of the boiler. It is very undesirable that any attempt should be made to carry the whole exhaust from the building into the boiler-shaft. If the chimney-shaft is not available for the chemical laboratory, it is best to provide a special fan for the exhaust of the fume-closets and the laboratory generally, conducting the air to the fan along a system of carefully-constructed tubes. In small laboratories the general ventilation may be effected by ventilators in the roof, and the exhaust of the fume-closets may be carried out by ordinary chimney-flues, in which an upward current is maintained by a gas-burner, but when it can be employed the fan gives by much the best results. It should be borne in mind that any system of air-conduits will serve also as tubes for the transmission of sound, so that rooms, like workshops, in which noisy operations are carried on, should be provided with separate ventilation. It must also be noticed that when a fan is driven at sufficient speed to exhaust through a great length of narrow tubes, it will necessarily be noisy, and the sound will be carried to every room which communicates with the ventilating system. Where rooms of different capacity communicate through independent tubes of different lengths, with the same exhaust chamber, the diameter of the tubes should be proportional to the fifth root of the square of the quantity of air to be removed per hour, and to the fifth root of the length of the tube. The great expense incident to efficient ventilation lies in the heat required to raise the temperature of the entering air in very cold weather. For example, suppose a building to contain 1,000,000c.ft. of air, and this is to be renewed only once an hour on the average of the whole building, and that the entering air must be heated through 27° F., or 15° C. The weight of 1,000,000c.ft. of air will be about 77,000lb., and its specific heat being ·24, the number of heat units required to raise this quantity of air through 15° C. is 277,200lb.-centigrade units. This will involve the condensation of 504lb. of dry steam, and the combustion of about 60lb. of coal; but this allows nothing for the cooling of the air within the building, which, in a brick or stone building, takes place mainly through the windows. If we adopt the usually-accepted principle that the amount of carbon dioxide in the air should not be allowed to exceed ·06 per cent., and that the supply of fresh air should, therefore, be at the rate of about 3,000c.ft. per hour for each individual, and three times that amount for each ordinary gas-burner (but nothing for electric lights), we find that for 1,000 persons in a building lighted by 333 gas-burners 6,000,000c.ft. of air per hour will be required, necessitating the combustion of 360lb. of coal per hour on an exceptionally cold day. If, however, electric light were substituted, current for 333 sixteen-candle lamps would require only 120lb. of coal per hour for its production; but if the gas-burners are so arranged that the products of combustion escape immediately, there can be no need for the double supply of air, and if the products of combustion mix with the air they will supply more than half the heat required to warm it. In the above sketch, arrangements have been suggested suitable for a building of considerable size, possessing, for instance, a capacity of 1,000,000c.ft. In the case of small schools, the same guiding principles may be adopted, though it will be impossible to obtain the same degree of specialisation in the appropriation of the rooms. Where the teaching of special local industries is necessary, the first thing to be done is to acquaint oneself with the machinery and methods employed in the factories or workshops where the particular trade is practised, and then to learn precisely the extent to which these appliances should be introduced into the technical school. In teaching purely technological subjects, the classes for which consist wholly of members of one particular trade, it is most important that the instruction should be under the general direction of a committee consisting wholly of members of the trade —masters, foremen, and operatives being all duly represented. Such a committee will do more to inspire confidence among apprentices and workmen in the practical character of the teaching than the most distinguished governing body; and there is no danger that under such direction the teaching will sink to pure empiricism if the teachers on the permanent staff of the institution are men of the right stamp.

Mr. Paul Waterhouse, in proposing a vote of thanks to Professor Garnett, remarked that it was not easy to give suggestions to architects proposing to build technical schools, because very much depended on the individual views of the staff of professors who would be engaged in the building. Mr. Garnett had, therefore, done well to lay stress at the outset of his paper on the advisability of a consultation between the architect and the head of the college before the plans were determined upon. The lecturer had given them some sound general principles to work upon in designing buildings of this class. In schools on a small scale, the preparation-room might very well serve also as a small lecture theatre, or might also be usefully fitted up as a laboratory. As it was desirable to keep the walls of a lecture room as low as possible, he should like to know of the relative position recommended for the lecturer's platform, and the lowest tier of benches. The drains under the desks of a chemical laboratory could very well be constructed in wood, but the larger ones would have to be formed in channels in the floor, and he had been informed by lecturers that stoneware was not always to be depended upon as a material for drains where chemicals were used. He should like to know what material the lecturer recommended for the top of a table in the chemical theatre—slate, hard teak, or lead.

Mr. C. H Brodie seconded the motion. He agreed with the lecturer that where funds did not admit of completing the entire scheme at once a technical college should, like a church, be designed on a comprehensive basis, and built in sections. He had found the Blackman propeller an excellent apparatus for removing fumes from chemical laboratories. Had the plenum system of ventilation been abandoned of late years, as he had not heard so much of it?

Mr. W. J. H. Leverton inquired what was the best form for a lecture theatre. A practical difficulty in the way of building the platform and magic-lantern supports in a lecture theatre on isolated piers was the risk of dust, rubbish, or small articles falling into the space between these piers and the general flooring.

Messrs. W. H. White and E. Sizer having spoken, the vote of thanks was carried by acclamation.

Professor Garnett, in acknowledging it, explained that the problem of preventing small articles and dust getting down the space between isolating piers and the general flooring was solved by slightly raising the general level of floor close up to the pier, so as to form a hood all round which nearly touched the brickwork; the pier itself was corbelled out at the floor level so as to overhang. By adopting this plan, screws and bolts would roll away from, and not down, the space next the pier, and little dust would find entrance into the space. For tables where great steadiness was required, and which had to sustain great weights, a slate top on a solid brick foundation was best, but for other purposes the lecturers' tables should be of teak, occasionally oiled, and provided with supports devised by Professor James Thompson. There was, of course, no difference between a plenum and an exhaust system of ventilation; the one was a pumping in of air, the other a drawing out by fan; the former system was intended to prevent draughts of cold air, but if rational inlets were provided there need be no draughts. The semicircular and horseshoe, were very convenient forms for lecture theatres; but in most architects' plans the space allotted to the lecturer was too limited.

THE SURVEYORS' INSTITUTION.

THIS society is one whose membership covers such a wide range, including as it does every class from the land agent to the quantity surveyor, that it is not surprising if sometimes papers are read at its meetings which, while they are no doubt of very great interest to the country members, are too purely bucolic in character to concern our readers. That read by Mr. Morris, of Chirbury, Salop, last Monday, treated of the "Four Course System of Cultivation," and, so far as it is possible for a purely non-agricultural mind to judge, dealt ably with the very important question to tenant farmers of the terms under which they hold their land from the owners. It seems that in many parts of the country a system of cultivation—*i.e.*, a certain rotation of crops—is insisted on in the farm leases. The object is to prevent impoverishment of the soil by the too-frequent repetition of certain crops, which, at the end of a tenancy, might leave the land unproductive; but, as Mr. Morris pointed out, any hard and fast rule of the kind, in every district or on any soil, is an injustice to the tenant, and a positive cause of depreciation in some cases of the value of the land. He quoted the opinion of Mr. Clare Sewell Read that the cost of agricultural labour had risen, from increased wages and decreased efficiency, 50 per cent. during the last fifty years, and said that the statistics from many parts of the kingdom corroborated this statement. The whole question of the present unprofitableness of agriculture seems to have a more distinct bearing than would at first sight appear on the interests with which our readers are concerned. Labour is, in rural districts and for purely farming purposes, so badly paid, and the profits of the farmer show so very little hope of a rise in wages, that the ranks of the ordinary labourer in towns (in the building and other trades) are swelled by a number of candidates, who, even if they are ready to take very low wages, are totally unskilled, and therefore probably unprofitable at any price. The whole question is one of the deepest concern to us all as a nation, to every particular trade as a craft, and to the great bulk of the inhabitants of our towns and rural districts, as seriously affecting the prices of necessaries and the general welfare of the entire population.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A PRIVATE business meeting of the Institute was held last Monday to make the annual award of prizes for essays and drawings, a list of which we give elsewhere. Mr. James Brooks occupied the chair, and proposed letters of condolence to be sent to the Queen and Prince of Wales in respect to the death of the Duke of Clarence. This was seconded by Messrs. Alfred Waterhouse, R.A., and J. J. Stevenson, F.S.A. The following gentlemen were elected members:

As Fellows: Oliver Caldwell, Victoria-square, Penzance; George Baines, 4, Great Winchester-street, E.C.; Robert Cochrane, Office of Public Works, Dublin; Charles William Lovett (Associate), 20, King William-street, Strand, W.C.; William Bakewell, 38, Park-square, Leeds; Robert Alexander Briggs (Associate), 2, Devonshire-square, E.C.; John Hatchard Smith (Associate), 41, Moorgate Station Buildings, E.C.; John William Taylor, 33, Westgate-road, Newcastle-upon-Tyne, James Thoburn Cackett, 24, Grainger-street West, Newcastle-upon-Tyne; Charles Stanley Peach, 8, John-street, Adelphi, W.C.; William Howard Seth-Smith, 46, Lincoln's Inn-fields, E.C.; Eustace James Anthony Balfour, M.A., Cantab, 10, Buckingham-street, Strand, W.C.; William Alfred Pite (Associate), 5, Bloomsbury-square, W.C. (Mr. Horace Field withdrew his name from the list of candidates.)

As Associates: Arthur Henry Moore, 25, Avenue Villas, Cricklewood, N.W.; Alfred Hayles Clark, 28, Paddington-green, W.

As Hon. Associate: Henry Trelawny Boodle, 53, Davies-street, Berkeley-square, W.

As Hon. Corr. Members: Carl König, architect, professor of architecture at the Imp. and Roy. Polytechnic High School of Vienna, Vienna; Otto Wagner, architect and "K. K. Baurat," Rennweg 3, Vienna, III.; Max, Baron von Ferstel, architect, Ungargasse 12, Vienna, III.

The discussion on the paper of "Amended Suggestions for the Conduct of Architectural Competitions," adopted by the Council, was postponed "on account of the death of the Duke of Clarence." The declaration of the poll for the election of Mr. Seth-Smith, the President of the Society of Architects, as a Fellow was received with much applause.

SHADOWS IN PERSPECTIVE.*—I.

By Arthur Vye Parminter.

THE science of putting in shadows in perspective drawings, or rendering the effect, as it is called, may well be studied after that of geometrical shadows. The student who has followed the recent articles on the latter subject will find the former study all the more interesting as combining the rules of geometry with those of perspective.

On the Continent, "Shadows" form an important subject of study in the science and art schools. In England, unfortunately, little importance is attached to this subject, and the ordinary draughtsman puts in any necessary shadows at his own sweet will and taste, with very little regard for rules or fitness. How often may we see a well-drawn elevation or perspective completely spoiled by an unscientific attempt to draw in the shadows! Observe a geometrical drawing, got up by a French student, and notice how well "the effect" of the building or object is arrived at; the projecting portions seem to stand out from the paper, and the receding portions to fall back into the distance in due proportion to the scale. Each shadow is first carefully drawn in, then neatly coloured, the greatest care being given to the proper gradations in the scale of light and shade and distance. For this reason a Continental architectural drawing is always clear and correct in tone; the tints and washes always clean and fluid; in this manner the details stand well out, and the general effect is neat and artistic.

Shadows in perspective follow to a degree the same rules as for geometrical shadows, combined with the rules of perspective.

In geometrical shadows, we have always taken the sun as being the source of light, the rays of light parallel to each other, and arriving at a fixed angle of 45° with the horizontal and vertical planes.

In perspective shadows, however, the case is

---

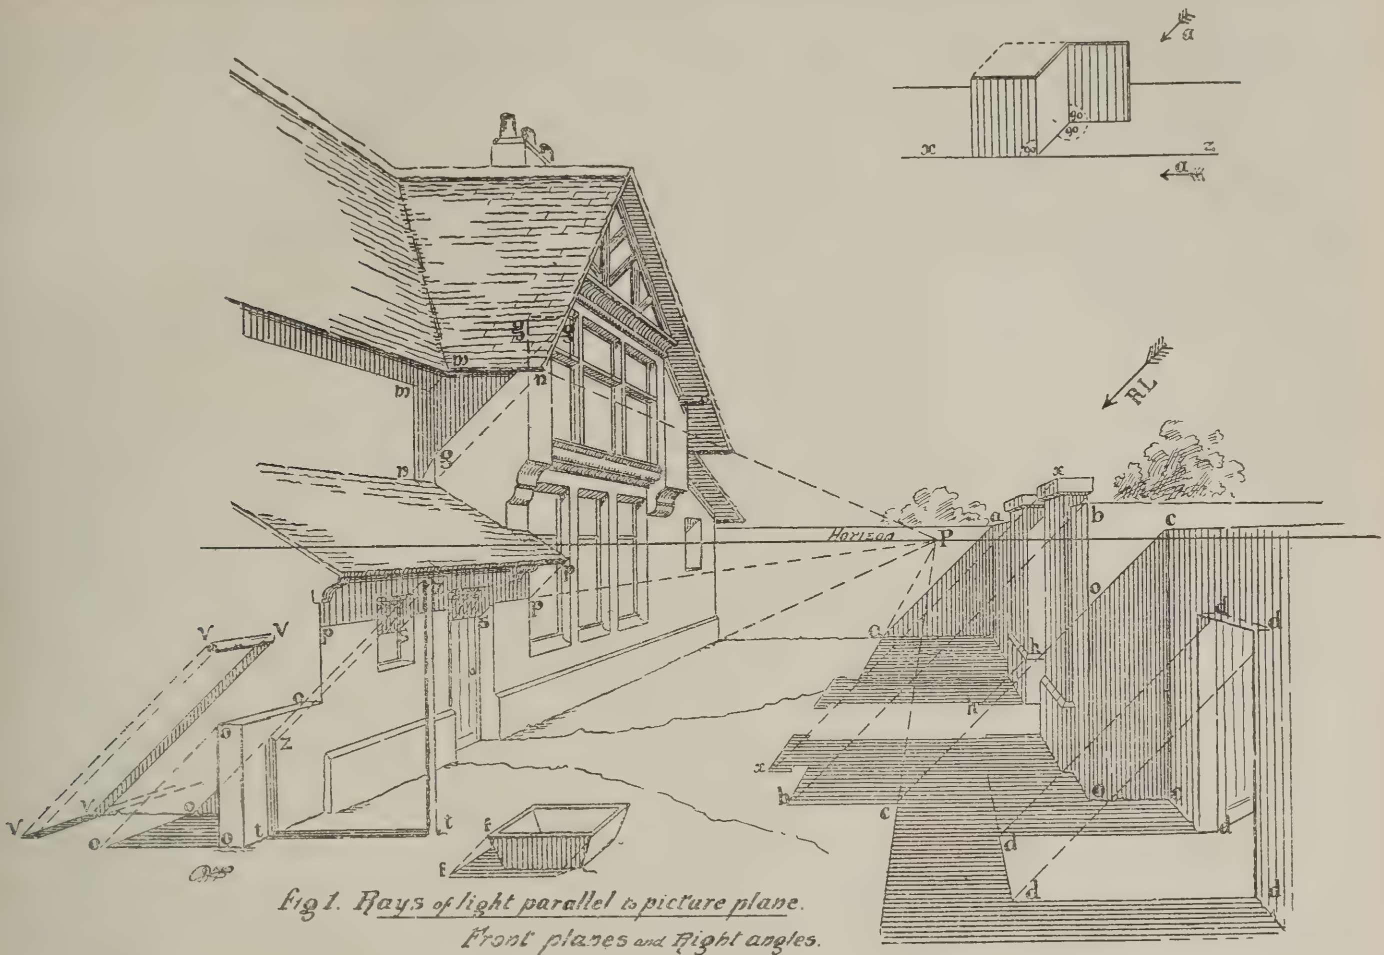

Fig 1. Rays of light parallel to picture plane.
Front planes and Right angles.

different. We will still take the sun as the source of light, but the direction of the rays may be varied according to the nature of the perspective and the taste of the draughtsman. We will take three cases for the direction of the rays of light: 1. The rays of light arriving parallel to the picture plane. 2. The source of light being before the observer. 3. The rays coming from behind the observer.

For each of these three cases we have to study the portion of the objects on which the rays of light fall. 1. On front planes and right angles. 2. On oblique planes and vertical lines. 3. On oblique planes and oblique lines. 4. On inclined planes.

We will take the case in which the rays of light arrive *parallel to the picture plane*, as indicated in elevation and plan by the arrows *a a* parallel to *x z*. Also the case of *front surfaces and right angles*, as indicated by the figure.

We wish to put in the shadow of Fig. 1. It is drawn in parallel perspective, with one vanishing point at P; the planes before the observer are parallel to the plane of the picture, and the general angles are right angles. The rays of light arrive at any angles we may desire to the horizontal plane, but they are at the same time parallel to the picture plane and front planes of the drawing—let us say the direction R L. The planes directly facing the source of light are, of course, brilliantly lighted; for instance, the gable of the house, the surfaces turned against the source of light, as the walls of the courtyard, are in natural shadow. The planes facing the spectator and parallel to the picture planes receive the ray of light, but are less brilliantly lighted.

From the angle *a* of the wall of the courtyard we draw the shadow line *a a* parallel to the direction of the rays of light R L. This shadow is intercepted by the ground line at the point *a*. From the point *a* we draw indefinitely a line *a b* from the vanishing point P. The shadow line from the angle *b* and its intersection with the line *a b* gives us the point *b*, where the shadow *a b* of the crest of the wall *a b* terminates. A horizontal parallel to the horizon line from the ground point *o* of the angle *b* should also meet the line *a b* at *b*, thus further assuring us of the correctness of this point. From the angle *c* we draw the shadow line *c c*. The shadow is cast on the front surface of the wall as far as the point *o* on the angle *b o*, the point of the intersection *c* with the line *c b* parallel to the picture plane gives us the shadow of the point *c* on the ground; a continuous line from the vanishing point though *c* determines the shadow of the crest of the wall. The opening or doorway *d d* allows the light to pass; from the points *d d* on the outer portion of the soffit of the doorway where the light strikes, the parallels to the direction of light, and the points of intersection with the ground line from *d d*, determine the surface of light, *d d d d*, allowed to pass through the open doorway.

For the shadows of the building, parallel to the direction R L, from the points *m*, *p*, *s*, *g*, &c., will determine the shadows thrown against the walls by the projecting eaves. From these points obtained lines must be drawn to the vanishing point. For the shadow of the projecting portion of wall *o o*, we draw the shadow line *o o*, the intersection with the ground lines, and the line drawn from the vanishing point determines the shadow. From the base of the post *z t* we draw parallels to the picture plane *t t*, meeting the wall ground line at *t*; the intersection of the vertical raised from *t* with the shadow lines from the summit of the post at *z* will give us the shadow on the ground and wall. Similarly for the projecting beam *v v*, the rays of light from *v* on the wall meet the ground line at *v*, the intersection of the line drawn from *v* to the vanishing point, and the shadow lines from the projecting end of the beam determines the shadow of *v v* on the ground and wall planes. The remaining shadows, as the opening and capping of the gateway at *x* and *h*: the box *f f*, &c., are left for the ingenuity of the student. It will be noticed that the shadows follow the same laws of perspective as the building, the shadows always converging to the vanishing point P. The student should, for practice' sake, vary the angle and direction of the rays of light R L, as far as regards the horizontal plane, respecting, however, for the present, the parallelism to the picture plane.

Palais des Beaux-Arts, Lille.

STREET CABLES.

CABLE railways are multiplying fast in America, and the cable-rope is now a large industry, generally $1\frac{1}{4}$in. in diameter, made of six strands of wire round a hempen core, which latter increases the flexibility of the rope. In Chicago, one grip is used to drag a train of cars, and the wear of the cable is very great. The cable in winter time often breaks, and has to be spliced to present a smooth surface to the gripping apparatus. The life of cables varies; in one case—the Temple-street cable road at Los Angelos, Cal.—the record shows for a cable 12,380ft. long a period of 3 years and 2 months; in San Francisco it shows 1 year 8 months for 106,225 miles, and 2 years for 119,153 miles run; and this latter record has been about the life of cables in Kansas City and Denver. The average is about 14 months, with from 70,000 to 80,000 miles of service. The longest rope in London is that just laid between Kennington-gate to Telford Park, Streatham, the company desiring to obtain powers to carry their cable system to Streatham Common, in which case it would be the longest single rope in the world, for from Kennington to Streatham Common is about $5\frac{1}{2}$ miles. The track has been laid by Messrs. Dick Kerr and Co., and the tunnel or channel is made of concrete and cast-iron tube frames, to which frames the slot-rails are bolted. The tube is 19in. deep from road-level, and $9\frac{1}{2}$in. wide. The tubes or channels are formed between the frames with boards, and then the concrete is thrown in outside. Under the bottom of the channel is laid a 6in. clay pipe, which will drain the tube. There are recesses which receive the pulleys for supporting the cable. At Birmingham four systems are in use, and the working expense of the cable system compares favourably with other modes of traction, or about 50 per cent. of the gross receipts.

* * *

A new coach factory in St. George's-road, Bristol, has been opened this week. It was illustrated in our issue of the 4th ult., and has been built from the designs of Mr. Edward Gabriel, architect, of Bristol, Mr. August Krauss, of the ame city, being the contractor.

THE SECOND PREMIATED DESIGN FOR THE NEW MUNICIPAL BUILDINGS AT BATH.—HOUSE FOR PROFESSOR HUXLEY AT EASTBOURNE. — HOUSE FOR SIR JOSEPH HOOKER AT SUNNINGDALE.—WOOD CARVINGS FROM THE NEW FOREST, LENT BY DR. ALLINSON. — WESLEYAN CHURCH, ST. LEONARD'S-ON-SEA.—A LONG OAK SETTLE, FROM LEEDS. —DESIGNS FOR A SMALL HOUSE FOR AN ARTIST.

Our Illustrations.

BATH MUNICIPAL BUILDINGS.

We published the plans, view, and elevations of the selected design for these buildings in our issue for January 8, and to-day we give similar illustrations of the second premiated design by Messrs. Burgess and Oliver, architects, of Gray's Inn. The plans show how skilfully the problem of working-in the existing central portion has been managed, and the view exhibits a clever treatment of the façade. The second pediment at a lower level in the return front seems open to objection architecturally. We have now published all three of the prize designs in this competition, as we gave drawings of the third premiated composition in the Building News for December 18th last.

HOUSE FOR PROFESSOR HUXLEY, F.R.S., AT EASTBOURNE.

This house has been lately erected at the junction of Staveley and Buxton-roads at Eastbourne. It is heated by Norwegian hot-air stoves, and lighted throughout by electricity. The walls are of red brick, and the roof is covered with Broseley tiles. The contractor for the work was Mr. J. Harding, of Eastbourne. The architect was Mr. Fredk. W. Waller, 17, College-green, Gloucester, and 8, John-street, Adelphi, W.C.

HOUSE FOR SIR JOSEPH HOOKER, C.B., F.R.S., AT SUNNINGDALE.

This house is situated on rising ground, above a mile and a half from Sunningdale station. It is built of red brick, with Bath-stone dressings, and the roof is covered with Broseley tiles. The contractor for the work was Mr. A. Estcourt, of Gloucester. The architect is Mr. Fredk. W. Waller, 17, College-green, Gloucester, and 8, John-street, Adelphi, W.C.

WOOD CARVINGS OF THE PASSION.

These curious wood carvings are from the well-known church of Stalshund in the Black Forest. They were shown last at the Crystal Palace Photographic Exhibition by Dr. T. R. Allinson, L.R.C.P., to whom we are indebted for the loan of the originals, as also for that of the altar piece we illustrated a few weeks since.

WESLEYAN CHURCH, NEW PARK-ROAD, ST. LEONARD'S-ON-SEA.

This church is at present being built by Mr. H. E. Cruttenden, the contractor, and will be finished and opened during Easter of 1892. The materials used for the exterior are Bath-stone dressings and local blue facings, and green slates for the roof. Bath stone has also been freely used in the interior for nave columns, &c. The building is being carried out from the designs and under the superintendence of Mr. P. H. Tree, F.R.I.B.A., St. Leonard's-on-Sea.

OAK SETTLES FROM THE OLD ARCHERY CLUB, LEEDS.

These two interesting long settles, forming part of the club's furniture, were recently sold by auction. The upper one on our illustrated sheet sold for £6 15s., and the lower one for £9 9s. They measure about 6ft. in length, and both are nearly the same height—viz., 3ft. 9in. from floor to top of back. The seat of the upper one is provided with a long flap, which lifts to admit to a locker. The carving in both is of an unusual and interesting character. We are indebted to Mr. F. Mitchell, of Leeds, for the loan of his measured drawings from which the perspective sketches were made. On May 7, 1886, we published a drawing by the same contributor of a chair which formed part of the same club's furniture.

"BUILDING NEWS" DESIGNING CLUB: A SMALL HOUSE FOR AN ARTIST.

(See description on p. 150.)

WEST HARTLEPOOL.

This town is rapidly coming to the front, as from the minutes of the recent Council meetings it would appear that it is making very rapid strides in its population, and that the Council is fully alive to this, and is making improvements and extensions in every direction, A large outfall sewer for the northern district has recently been completed. A new cemetery, twenty acres in extent, with boundary wall and specially designed drainage, is now in progress, and is expected to be completed shortly. New abattoirs are to be erected immediately a suitable site can be obtained. A large central depot and stable yard has been completed, with stabling for all the Corporation horses, cart sheds for forty carts, steam-roller house, special machinery for cutting chaff and grinding corn for the horses, also a station for the Fire Brigade, with special drying tower for the hose pipes. A new façade to the public market, composed of six large three-story shops and offices, is to be built at once, designs and plans for which were approved at the last Council meeting. Two new intercepting sewers of large dimensions are to be proceeded with at an early date, one along the Burn Valley, as an outlet for the Park district, which is rapidly developing, and the other as an outlet for the entire western section of the borough. New streets at an estimated cost of many thousands of pounds are also in hand. A large scale plan of the borough has been made, and a survey of the whole of the sewers in the borough is in progress, which will give the position, direction of flow, size, kind, depth, and condition, together with the manholes, ventilators, and gullies.

Mr. I. W. Brown, A.M.I.C.E., F.G.S., the borough engineer, who has designed and is carrying out the whole of the above works, would appear to have his hands full at present.

◆

The death occurred, last week, of Mr. A. W. Blacker, proprietor of the Royal Marble Works, St. Mary's Church, Torquay.

Mr. Alfred Porter, F.R.I.B.A., of Grange-road, Bermondsey, and formerly of Norwood, died on Thursday in last week, aged 55 years. Mr. Porter was a life member of the Institute of British Architects, which he joined as an Associate in 1856, becoming a Fellow four years later.

New public offices are about to be erected at Merthyr Tydfil. Mr. E. A. Johnson, of Abergavenny (whose design was selected in competition for a much more extensive scheme some time ago), has been instructed to prepare the necessary plans. The revised scheme will embrace a vestry hall and county court, together with accommodation for the various local governing bodies and public officials.

The river Teign divides Teignmouth and the pretty villages of Shaldon and Ringmore, the latter place having one of the most interesting and complete 13th-century little churches that the large county of Devon can boast of, with an east window that commands the admiration of all who see it. It has been found necessary to build a separate church for the larger place, Shaldon, for which Mr. Edmund Sedding, of Plymouth, has been asked to prepare plans.

COMPETITIONS.

Manchester.—The Council of the Whitworth Institute received 23 complete sets of drawings in reply to their advertisements. After examination of these drawings, the Council invited Mr. Alfred Waterhouse, R.A., to act as their professional referee and adviser. His award as to the three designs to be selected for distinction has now been made. Mr. Waterhouse has certified that, in his opinion, the drawings of "Terra-cotta (No. 2)," by Messrs. J. W. and R. F. Beaumont, Manchester; "Floreat Mancunium," by Mr. Archibald Neill, Leeds; and "Three Sisters," by Mr. Geo. Freeth Roper, Manchester, should be so distinguished, and in this order of merit. The council will arrange for the exhibition, to any competitors who care to inspect them, of the whole series, and will announce the time shortly.

Shrewsbury.—At the last meeting of the town council of Shrewsbury a long and animated discussion took place as to a report from the watch committee as to the designs received for the new police-station. The committee stated that, in conjunction with the assessor, Mr. R. Knill Freeman, of Bolton, they had most carefully considered the competitive plans sent in, and had no hesitation in recommending that the first premium of £24 be awarded to the author of the design sent in under motto "Well Considered," and that the second premium of £15 be awarded to "Nota Bene," providing "Well Considered" and "Nota Bene" undertook that, if required, the whole of the work could be carried out for a sum not exceeding £3,000. Several members of the council demurred to the acceptance of this report on the ground that the assessor had originally placed the design under motto "Night Watchman" first, but disqualified it, as the author estimated the cost at £3,100. An amendment having been moved that the recommendation be referred back, Mr. Knill Freeman's report was read, and stated that, while in order of merit he placed the designs thus: "Night Watchman," "Well Considered," and "Nota Bene," he had no alternative but to make his award thus: 1st, "Well Considered"; 2nd, "Night Watchman"; and 3rd, "Nota Bene." The amendment was rejected by a large majority, and the committee's recommendation adopted; and it was further decided to appoint the author of "Well Considered" architect for the building, the premium to merge in the usual commission. The sealed envelopes containing the name and address of each competitor were then opened. "Well Considered" turned out to be Mr. John Johnson, Queen Victoria-street, E.C. (the architect for the new baths at Shrewsbury); "Night Watchman" was the *nom de plume* of Mr. A. E. Lloyd Oswell, Shrewsbury; and "Nota Bene" that of Messrs. Grundy and Son, Ulverston.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Leeds and Yorkshire Architectural Society (Incorporated).—A general meeting of this society was held at their rooms, Albion-place, Leeds, on Monday last. The president, Mr. W. H. Thorpe, F.R.I.B.A., in the chair. Mr. J. M. Brydon, F.R.I.B.A., read a paper entitled "The English Renaissance."

Manchester Society of Architects.—One of the leading objects of the reconstruction of this Society was to afford facilities for the study of architecture, other than such as are found in ordinary office routine. This has now been to some extent accomplished by the formation of two classes for instruction in (1) History and Development of Architecture, and (2) Materials and Construction, which will be open to students whether members of the society or not. Mr. H. E. Stelfox, A.R.I.B.A. (Ashpitel Prizeman, 1888), has been appointed lecturer. They will be held weekly, having been commenced on Monday last. In addition to the above, classes of Design (senior and junior), and for Sketching and Measuring have been arranged for members only.

York Architectural Association.—A meeting of the members of this Association was held at the Church Institute on the 14st inst., when Mr. George Benson read a paper, entitled "Wanderings in Paris." A number of illustrations were shown by means of lantern-slides. The chair was occupied by Mr. W. G. Penty.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations*, and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances*, under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance*, as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names. We cannot keep the list open long, so those desirous of being included should *send in their instructions at once*, as when the allotted space is full no more names will be received this year.

ARCHITECTURAL DESIGNERS—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

ARCHITECTURAL PHOTOGRAPHERS—
Bedford, Lemere, and Co., 147, Strand, London, W.C.

ARCHITECTURAL TERRACOTTA—
Gibbs and Canning, Ltd., Tamworth.

ARTISTS IN STAINED GLASS—
Bourne Swaine, 61, King Edward-road, Birmingham.

ASPHALTE—
Avelines Sicilian Asphalte. Joseph Bernays, 96, Newgate-street, E.C.

BATH STONE—
Bath Stone Firms, Limited, Bath.

BLINDS—
Williams, G. A., and Son, Queen's-road, Bayswater.

BOOKS—
B. T. Batsford (Professional), 52, High Holborn, London, W.C.

BRICKS—
Accrington Brick and Tile Co. (Facing Bricks, Plastic and Semi-Plastic), 8, St. James-street, Accrington.
Gibbs and Canning, Ltd. (White Glazed), Tamworth.
Heather Brick and Terracotta Co., near Ashby-de-la-Zouch.

BRICK AND TILE MACHINERY—
Clayton Howlett Co., Woodfield-road, Harrow-road, W.

BUILDING & QUANTITY SURVEYORS—
Anderson, A. E., 36, Victoria-road, Northampton.
Flew, J., 11, Popplewell Chambers, Bradford.

BUILDING COMPOSITION—
White, W., Great Western Works, Abergavenny.

CASEMENTS AND WINDOWS—
Burt and Potts, 38 and 65, York-street, Westminster, S.W.
Wragge, Geo. (Wrought Iron, Steel, and Gunmetal), Wardry Works, Chapel-street, Salford.

CEMENT MANUFACTURERS—
Rugby Portland Cement Co., Rugby.

CEILING DECORATIONS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

CONCRETE—
Fambrini and Daniels, Excelsior Art Concrete Works, Lincoln.

CURTAIN BLINDS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

DECORATORS—
Campbell, Smith, and Co., 75 and 78, Newman-street, London, W.
Lamb, J. (Specialist), 14, Marlbro'-road, Turnham Green.

DEVONSHIRE MARBLE—
Goad, J. and E., Phœnix Steam Marble Works, Plymouth. (See Brompton Oratory.)

ELECTRIC BELLS—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.
Teale and Somers, Electricians, Leeds.
Wright, Archibald J., 7, Beaumont-road, Hornsey-rise, London, N.

ELECTRIC LIGHT APPLIANCES—
Macfarlane, Walter, and Co., Saracen Foundry, Glasgow.

FANLIGHT OPENERS—
Osborn, David, High-street, Berkhamsted.

FIBROUS PLASTER—
Plastic Decoration and Papier Mache Co., Ltd., 21, Wellington-street, Strand, London, W.C.

FIREPLACES—
Edwards, F., and Son, 54, Great Marlborough-street, W. (see advt. p. V.)
Teale Fireplace Co. (Teale and Somers), Leeds.

FIREPROOF FLOORS—
Lindsay Neal, W. H., and Co., 15, North Wharf, Paddington.
Phœnix Fireproof Flooring Co., 9, Oxford-street, Manchester.

FIREWOOD SPLITTING & BUNDLING MACHINERY—
Glover, M., and Co., Patentees and Saw Mill Engineers, Leeds.

FURNITURE—
Foster and Cooper, 63, Long-row West, Nottingham.

GASFITTERS—
Beaven and Sons, 38, Eastgate-street, Gloucester.

GRANITE MERCHANTS—
Webb, Percy C., 41, Eastcheap, London, E.C.

GRATES—
Edwards, F., and Son, 54, Great Marlborough-street, W. (see advt. p. V.)

HEATING APPARATUS—
Boyd, Jas., and Sons, Paisley.
Edwards, F., and Son, 54, Great Marlborough-street, W. (see advt. p. V.)
Grundy, J., 30, Duncan-terrace, City-road, London, N.
Teale Fireplace Co. (Teale and Somers), Leeds.

HORTICULTURAL BUILDINGS—
Boyd, Jas., and Sons, Paisley.
Gloucester Railway and Carriage and Wagon Co., Gloucester.
Macfarlane, Walter, and Co., Saracen Foundry, Glasgow.

HYDRAULIC RAMS—
Blake, John, Oxford-street Works, Accrington, Lancashire.

INTERIOR WOODWORK—
Foster and Cooper, 63, Long-row, Nottingham.

IRON AND STEEL GIRDERS—
Walmsley, B., 15, Mawdsley-street, Bolton.

JOINERY—
Brock, W., and Sons (and Woodwork of all Descriptions), Albert-road, Bristol.
Elliott, Saml., Albert Joinery Mills, Newbury.
Gloucester Railway and Carriage and Wagon Co., Gloucester.

JOINER'S OILSTONES—
Whittle Hill Hone Co., Charley Forest, near Loughboro'.

LIGHTNING CONDUCTORS—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.
Morris & Gold, Wardrobe Chambers, Queen Victoria-st., E.C.
Teale and Somers, Leeds.

LIFTS AND CRANES—
Waygood, R., and Co., Falmouth-road, Gt. Dover-street, S.E.

LIME BURNERS—
Rugby Portland Cement Co., Rugby.

LOCKS—
Colledge and Bridgen, Wolverhampton.

MARBLE WORKERS—
Emley and Sons, Ltd., Marble Works, Newcastle-on-Tyne.
Patteson, J. and H., 36 and 38, Oxford-street, Manchester.

MOSAIC WORKERS—
Patteson, J. and H., 36 and 38, Oxford-street, Manchester.

PAINTS—
Torbay and Dart Paint Co., Ltd., Dartmouth.

WAYSIDE NOTES.

AT last we are to have what has been all along wanted in connection with a great question of the day—the London water supply. This is to be a royal commission, whose business it will be to deal with the matter in a broad aspect. We have had enough of the pettinesses relating to the *control* of the supply. It is more than probable that the present London companies know their own business in this way, and that we should not benefit by any mere transference from private hands to public corporations. There may be persons anxious to get the control of the water in certain quarters, but the public do not care—at the present juncture—two straws about this matter. So much of the B.P. as is informed on the subject know that the important problem requiring solution is the *supply itself*. Is it sufficient, and will it be so in the near future? Is it pure and wholesome, and likely to remain so? These are the drastic points in the matter; and if, as we imagine, they cannot be satisfactorily answered, there then presents itself the question of a new and copious supply of undeniable purity.

I think, considering our manners and customs, we should be thankful that no worse epidemic than the present prevalent one fastens upon London. Not to refer again to the extraordinary system of allowing crude sewer-gas to escape into the streets night and day, without ceasing, at innumerable points, it is sufficient to reflect how we turn our sewage into our once noble river and draw our drinking-water from the same stream! Let us thank a long-suffering Providence that we only get influenza; and if we have an opportunity at hand for remedying the evils of a contaminated water-supply, let us grasp it while we may.

Mr. Ritchie's letter to the Chairman of the County Council points to exactly the sort of information required respecting this question, and I look hopefully to the appointment and labours of the commission. An exhaustive inquiry into the nature and scope of the present supplies in the two watersheds of the Thames and Lea, and an investigation of future prospects, will give the statistical information required. We know that a general impression has gained ground that the sources of supply are yearly becoming more taxed, and the contamination of many of the metropolitan waters is annually demonstrated by analysis. It is, moreover, a necessary result that overdrawn supplies must mean increase of contamination in those reservoirs supplied from the Thames and Lea. Even if it were only with a view of obtaining a purified supply, the appointment of the commission is most desirable; but over and above this would be the blessing of an *increased volume* of water if the commission should find a new source of supply necessary.

In March, 1874, in *Good Words*, Charles Kingsley wrote a most interesting article on a new water supply. In it he drew a pen-picture of an old Roman emperor rising from his grave and visiting the site of London under the guidance of a minister of state, and among the comments of the august shade was the following:—"But if you wish me to consider you a civilised nation, let me hear that you have brought a great river from the depths of the earth, be they a thousand fathoms deep, or from your nearest mountains, be they five hundred miles away, and washed out London's dirt—and your own shame." And, further, Kingsley's own expressed sentiments:—". . . . I think we, the people, will have our fountain, if it be but to make our governments, and corporations, and all public bodies and offices, remember that they all —save her Majesty the Queen—are all our servants, and not we theirs; and that we choose to have water, not only to wash with, but to play with, if we like. And I believe—for the world, as you will find, is full, not only of just, but of generous, souls—that if the water supply were set really right, there would be found in many a city many a generous man who, over and above his compulsory water rate, would give his poor fellow-townsmen such a real fountain as those which ennoble the great square at Carcasonne and the great square at Nismes, to be 'a thing of beauty and a joy for ever.'"

I was much interested in your very sensible leader on "Competitions with the Latest Improvements." All you say will be seconded and acknowledged as substantially correct by competing architects of experience. The dual system is certainly delusive in many respects, particularly as to the saving of labour. The 1-16 scale drawings of the preliminary competition are merely reproductions by one-half of 1-8 scale drawings. Competitors know that this will be so, and in consequence draw their plans like a steel engraver; and I expect many a piece of work of this kind has been executed magnifying-glass in hand. Practically, it therefore amounts to a photo-reproduction of a larger drawing; and indeed, I recollect that some years ago a friend suggested to me the idea of drawing competition plans to one-eighth scale, and having them reduced by process or photo-lithography to one-sixteenth, and then sending in these reproductions to the competition. I don't see why this should not be done if the competitor thinks he will gain thereby, and does not mind the expense and trouble. An assessor could hardly put the exhibit out of court for the act. Personally, I should prefer drawing to one-sixteenth, as, having been brought up in a fine-line school of draughtsmanship, it is no trouble to me. To some persons, unfortunately, small drawing is found impossible on account of weakness of eyesight, and such persons are at a great disadvantage where a small scale is enforced.

The remedy for the waste of time by laborious preparations of small-scale drawings is undoubtedly to be found in the direction you suggest—viz., that sketch-plans be made really so. Unfortunately, as in many other things in life, it is not so much the finding of the remedy as its application, that baffles reform. How can one compel competitors to prepare a sketchy set of plans, even if he knows all others will do the same? It may be that the media employed for the drawings will help us a little. If *pencil sketches* only were asked for, and other media rigorously forbidden by the rules of the competition, much might be done. With the pencil so much might be effected in such a short time that, in point of speed, it is not to be compared with pen-work, and, moreover, excessively fine work is useless, it not being effective with pencil. Such a course would absolutely necessitate the employment of a competent assessor, for the reason that with the benefits come drawbacks, chief of which is the ease with which ordinary people may be deceived by showy pencil drawings, particularly if cunningly tinted. I think I would have *colour* excluded altogether in such preliminary sketches, but on this point there is something to say on both sides. With the assessor, perhaps, it might safely be allowed.

If it be impossible to make reforms in this or any way, then one might urge that if architects trained up their pupils in the way they should go, they would the easier be able to cope with fine pen drawings. Education in fine line drawing would enable them in after life to draw finely; but so often young men are taught—or teach themselves—to draw in a coarse manner, under the delusion that thereby they are gaining the much-coveted "artistic touch," that fine work is impossible to them. Fine lines and accuracy are at the bottom of all good draughtsmanship. It may be irksome, when a pupil, to be told of every minute inaccuracy of line and tint in one's work; but it is such training that alone forms a sure foundation for after-life. It is true that if the young apprentice has not in him the stuff to make an artistic draughtsman, he will never be able to get rid of an engineering method of drawing; but I submit that he will be infinitely better off with his neat work than with an affectation of broken lines, dots, dashes, and twirligigs, and the generally coarse, rough method acquired in endeavours to gain an artistic touch. On the other hand, if he has the makings of a good architectural draughtsman, the "touch" will come of its own accord. As well put the infant to copy the handwriting of the grown man as the architectural pupil to imitate his master's idiosyncrasies of drawing. The copper-plate pot-hooks must come first. All this must be taken *à général*; for I do not want to be thought to advocate eye-straining drawing in any way, and particularly in competitions. I only say that it is as well for all to be properly prepared for possibilities, and able to draw finely as coarsely. It is much to be hoped that the reforms you advocate can be brought about, to the relief of the already much-tried eye of the architect.

I am glad to see that the President of the Society of Architects, Mr. Seth-Smith, who consented to allow himself to be nominated a second time as a Fellow of the Institute, after the not very creditable tactics of some of the members of that body which some time back resulted in his rejection, was elected last Monday amid hearty signs of satisfaction on the part of all present. Fellowship of the Institute can add very little to the well-deserved esteem in which Mr. Seth-Smith is held by the profession, and more especially at the Society of Architects, where his courtesy and high character have so often, advantageously, but not noisily, manifested themselves; for Mr. Seth-Smith is as modest as he is energetic, but it can and does mark the willingness of the official head of the newer body to work in all unity with the Institute in all matters which affect the general welfare of the Profession. Mr. MacVicar Anderson ought to return the compliment by putting himself in nomination for the Society now, and if he and Mr. Seth-Smith could change presidential chairs when their respective terms of office expire, I am sure no sensible member of either body would be aught but pleased.

By the way, I expect a very few days—perhaps hours—will elapse before you will make an announcement of the highest importance with regard to the position of the Society of Architects. If I am rightly informed, something is taking place which will almost certainly double the membership of the Society as soon as it is made known, and not the less speedily because it is more than possible that the official recognition of the high status the Society has won, after an existence of little more than seven years, may be shortly followed by the right to prefix the word "Royal," as well as something else. I am not a great stickler for "Royal" societies myself; but just as we have a Royal Academy and a Royal Institute of Painters, so it will be only fair and fitting that there should be a Royal Society as well as a Royal Institute of Architects. The abbreviation "M.R.S.A.," moreover, will avoid any possible confusion with the "M.S.A." of the gentlemen who join the Society of Arts—of course, with nothing but the most laudable desire to encourage the praiseworthy, if somewhat comprehensive, efforts of that body to help on the interests it has at heart.

GOTH.

CHIPS.

The town council of Heywood, near Rochdale, decided at their last meeting to invite competitive plans for a proposed technical school, and to offer premiums of £20, £10, and £5 for the designs placed first, second, and third.

The town council of Guildford have decided to adopt a sewerage scheme prepared by Mr. Lailey, C.E., and to invite tenders for its execution. The estimated cost is £35,000.

The Bishop of Peterborough has issued an appeal for £4,000 for the completion of the restoration of the cathedral, by the repair of the transepts and eastern chapel.

M. Ernest Christophe, the well-known Parisian sculptor, died on Sunday last. A pupil of Rude, his chief works are the bronze figure of "Fatality" in the Luxembourg, executed in 1885, the "Comedie Humaine" in the Tuileries Gardens, and "l'Eternelle Enigme," exhibited in the Salon of 1889.

The Bristol City Council have been anxious for some time past to develop the corporation estate at Portishead, and the question of the manorial rights having been satisfactorily settled, application has been made to the Local Government Board to enable the committee to grant leases of building land in perpetuity instead of for 75 years, as at present. About twelve acres have been released, and applications from builders for plots of land in this area have been considered.

An unpleasant incident is reported from the Nottinghamshire County Council. At the last meeting of the council a report was brought up from the highways committee pointing out that a certain firm of contractors for the supply of road material had had some of their supplies condemned by the county surveyor, whereupon they had sent the surveyor a letter of explanation, and inclosed for his acceptance, in accordance with what they termed their "usual custom," a postal order for £1 5s. As a matter of course, the matter was laid before the highways committee, and the contract was cancelled.

"BUILDING NEWS" DESIGNING CLUB.

AN ARTIST'S HOUSE AND STUDIO.

SMALL houses furnish always exceedingly popular subjects for essays in design, and we are not surprised at the large number of drawings sent in response to our invitation for plans. Two things we regret—first, that the designs are not, as a whole, better in style and planning; and, secondly, that we are unable to specially describe every design for the benefit of the authors. We have made our choice, and publish the two first selected plans. "Vulcan" ranks first, "Smilash the Goth" comes second, and "Cotonopolitan" may take the third position, though "McGinty" runs him rather close.

The conditions for the contest were as follows:—A small house for an artist, with a spacious studio, having a large window facing the north. Cost of building to be about £800. Accommodation to comprise a good living room, measuring somewhere about 18ft. by 14ft., a small square-shaped hall, and staircase 3ft. 6in. wide. Kitchen and offices. Four bedrooms, bathroom, and w.c. on first floor, and the studio on the top floor, with a small property or box-room leading out of it. The upper flight of stairs may be 3ft. wide, and it is to be remembered that pictures have to be brought down from the painting-room. Site to be a suburban one, 35ft. wide and 110ft. deep, one of a row. Frontage line 12ft. from fence line. Style suitable for cement-faced walls, with stone dressings to the front and side windows. Scale 8ft. to the inch. Three elevations, one section, and three plans with sketch.

"Vulcan" hardly makes his treatment for plasterwork sufficiently characteristic; so far as the general façades go, they might equally well be done in brick or stone. The quietness displayed is good, and the building is fairly representative of its purpose. The hall and staircase would be dark; but the removal of the inner door and screen at the entry would modify this objection. In so limited a hall such a lobby is undesirable, and may well be left out. Two doors to a small living room are not an advantage; see how the sideboard has to be thrust up in the corner. If the pantry had been made a service lobby with a hatchway over the buffet, and the coal-place converted into a pantry, the arrangement might have been improved. The absence of a way into the garden save past the scullery window is an objection, and the way in which the house is shown set down in the middle of the width of the site furnishes no satisfactory explanation, because with no windows in it the right-hand wall had far better come on the boundary line, and give more space to the other side. The tradesmen would have to go right round to the back of the kitchen overlooking the garden patch, and spoil its enjoyment by the family. The plan shows care and ingenuity: the rooms are square and the administration is concentrated. There is no waste of expense on fussy features. "Smilash the Goth" draws a little carelessly, which is no gain. His design is more ambitious, but his plan is distinctly clever. In so small a house the porch, lobby, and hall, when put together as so many feet super., make up a considerable area, which is a trifle expensive way of making the most of the available space. It is, however, a great merit to have the staircase out of sight of the front door, and a roomy hall is always an advantage. We do not call the kitchen well arranged with the door next the fireplace, and the copper should be in the scullery. The coal-place is in a very awkward position, while the scullery would be all the better for an outer door. The kitchen window, if not immediately overlooked by that of the next house, should have had its window in the right return wall, and not so placed as to command the garden. An inclosed space here would have got over nearly all these objections. The elevations are made to recognise the use of cement facings in the treatment, but for £800 are much too cut up and elaborated. The idea is original and rather striking, but the perspective does not help to realise it to advantage. "Cotonopolitan," the third man, sends a design which would look nearly all roof, and be better adapted in general lines to a lodge in some gentleman's country park than an ordinary suburban site. Questions of head room and the proportions of the rooms are matters which seldom trouble the aspirant for artistic honours; they belong to the mere constructional architect, the professional man, not to the "pilgrim of art." As, however, we are building houses for people to live in, do let us try and be practical, and plan bedrooms with spaces for beds out of the draught and not so that the beds will block up the fireplaces. There is much in this design which is meritorious and full of simple, well-restrained fancy. The studio is a big one, but the author gives all the other elevations except the one showing how the big window would be managed outside. The section and plan hardly help one, and raise doubts as to good construction. "M'Ginty" spoils his otherwise skilful plan by the muddle he has made of the staircase coming over the hall fireplace. The plans do not show really the whole truth about this muddle; but it is evident enough on closer inspection that it must be so, and if the contributor has deceived himself he has not misled us. The plan in other respects is good enough, though the elevations are overdone rather, and not cheaply contrived. "Jean" gives us a house with not a few points of merit in it. He devotes too much room, however, to the hall and landing over it in such a dwelling, and, effective as the angle turret window bay is, £800 would not nearly allow of its being included in the contract. The conservatory at the rear of the hall leading to the garden would form a useful purpose better if we did not have to pass the kitchen door so closely on our way. "Q. E. F." puts his kitchen in the front; but as the house faces the north, there is something to urge for this arrangement, as the living-room by this means leads out into the garden and obtains the southern aspect. It is a mistake, however, to locate the scullery in the middle of the house, and to make it necessary to pass through the scullery to reach the kitchen. Upstairs the rooms are nice enough, and the studio is L-shaped, with two windows instead of one big one. We place this design in this place chiefly by reason of its elevations, which are really very good, and suitable for a plaster treatment. "Symbol" is one of the best for his capital living-room, spacious kitchen, well-lighted staircase, and big studio. The elevations are passingly good, but overwindowed in the upper part to the detriment of artistic effectiveness. Light, however, in this country is always valuable. "Red Lion" makes his house one of a terrace, and his front elevation looks well in the geometrical drawing. The perspective spoils it. The plan has been carefully worked out, and there is a good, well-lighted, square hall. The staircase is too much in evidence. "Ayrshire's" design has a Scotch flavour about it, designed with dignity and reserve. The studio window would never do: there is far too much masonry about it, excluding the light where it is most wanted. The plan is well arranged, and would be practical if walls came over walls instead of mid-air in some cases. "Black Prince" believes in half-timber work, and has sent a fairly pretty design a little high-shouldered looking in the view. The plan is better than some, and shows that H.R.H. is on the right track. Pray let him give up scribbled ornamentations such as figure in these gables. "Orient" has an ingenious hall, and keeps a way into the garden, which shows thought, and so does the way in which he keeps the kitchen and scullery in subordinate positions. The front would look better in execution with the ornament here indicated left out. The studio window looks like business. "Nil Nisi Bonum" sacrifices everything in the upper stage of his façade to this latter idea, and there is no actual reason why a studio window should be made repulsively ugly. The lower part of this design is not half bad, so that the falling-off displayed above is all the greater pity. The hall would be very dark, and three doors into the living room spoil it. The plan otherwise has merit about it. "Spider" fancies cusped Gothic windows favour studios, but this is not so. He has put a row of top lights, which a painter would find very difficult to control, especially when there are six of them lighting three flat ceiling lights stuck in at the collar level. The plan has had considerable care expended on it evidently, but the people using the w.c. under the stairs would have sparse head room, and the back stairs is hardly necessary. The plan, broadly speaking, is too cut up. "Firefly" gives us a pretty façade, and he has good taste, but divides his studio into two comparatively small rooms, which might do for "black and white" work, but not for painting. This contributor should do better than this, and we shall expect him to do so. "Sweet Auburn" is another man of whom the same may be said. The heavy console at the entrance verandah shows his want of skill in matters of detail, and the superficial area of his house would make it come out, if cubed up at about 2½d. or 3d. per foot, speaking off-hand. It is too big for the money. The south elevation is very ugly. "An Old Hand" has boldly endeavoured to let us see that he knows how to use plaster, and he does so in a plain, straightforward manner—we fear a trifle commonplace, and not in a telling way. His plan corresponds in merit, but his third and fourth bedrooms are exceedingly inconvenient, as would be the iron ties in the studio, the window of which is badly managed. The skylight is not always wanted, and would make the room fearfully cold. "Pen" gives us a pleasing, well-balanced elevation, which would have been improved had the lower pediment been left out. It competes now with that over the dormer to the studio. The plan pleases us, and no doubt "Pen" will do good work if he keeps on as he has commenced. "Black and White," careful to a fault, has improved since we last saw his handiwork under another motto. We do not like the servants' w.c. under the stairs; the larder is too small, and the bath-room combined with the w.c. is not a good arrangement. The living-room is too cut up, but probably it would be a pretty room with the side windows dodged up high. Jointing up the cement work to imitate ashlar work is not the best style to adopt with scratched lines; rusticated work, as in old examples, is different, and seems to suit plaster. "Norman" gives us too big a house, which, however, he has planned well, but spoilt its effect externally by a very poor perspective. "B" in a circle gives us a stone-fronted house, with stepped gables and an embattled porch—a villa type of house of not the best kind. It would cost quite twice the sum we stated. "Cyclist" is much more within reason and our means. The studio is badly lighted, however. The elevation in the lower part is pretty, and the plan shows attention to our comfort—that is, it would do so if we contemplated living in the house. The entry is poor. "Pastime" cubes his plan up at 5½d., like the design placed first, and brings the cost out at £794. The lead-covered shaped bay could not be taken at such a price, neither could the roofing, hipped and gabled as it is. The author seems to spare no pains, and has given the artist a very good house for convenience, though possibly not for artistic merit. "Unitate Fortior" goes in for thick walls needlessly, and his plan is crude, but we like the simplicity of his elevation. It does not in the least indicate a painter's studio, however. "Forward" looks as if he had gained inspiration from a "model vicarage house in the Tudor mode" done in cement about forty years ago. This is not going "Forward." The studio appears an after-thought stuck up in the roof. "Hales" is simple enough, and puts his kitchen in front and a good square living-room behind. It would be rather dark with the verandah, and so would the cramped landing upstairs, else the plan is worthy of commendation. "Red Brick" is neat, but his façade looks high-shouldered at the summit and top-heavy. How the main outside wall to the studio is to be carried over nothing is beyond our powers of conception as here limited. "Sphinx" has lost nothing by having finished his design before he understood what was intended. We put him in this place just the same on his merits, which are not in this case very considerable. "Nimrod" is poor, with good parts and very bad ones, such as the trunk shaft to light the bath-room, which would get clogged up with snow! "The Useless One" is not altogether so, but he has much to learn before he changes his name. One thing to begin with is that 18in. walls are not necessary for the internal walls of a small house costing £800. The remaining designs are thus grouped in merit:—"Mica," "Tyro," "Ilex," "Ray," "Albyn," "Plan," "Hilarius," "Pendragon," "Goblin Grey," "Gradatim" (Stockport), "Western," "Sanitas," "La Cigale," "Hut," "The Idler," "Grandison," "Nodrah," "Mars," "Sector," "Love's Labour," "Forward" (Ipswich), "Kentish Rag," "Koko," "Sunset," "Jamrach," "Gobo," "J." in a circle, "Yorkshire Tradition," "Hubby," "Tempus Fugit," "Punch,' "John Jones," "Filiolus," "Old Postage Stamp," "Hardwick," "Gradatim" (Ipswich), "Sniktaw," "Wit," "Herbert,' "Progress C" (drawn on too big a sheet, see rules), "Terra Cotta" (no name or address), "Ich Dien" (ditto), "Peterborough," and "Devil's Chimney."

NOTES ON BUILDING PRICES.—XX.

By JOHN LEANING.

MARBLE MASON.

THE marble used in a building, if in large quantity, is nearly always the subject of a separate contract, and if not so treated by the architect, the builder sublets it.

Its use for such purposes as counter tops, steps, and wall linings is extending; but for chimneypieces, except in the form of slips in combination with other materials, is decreasing.

Chimneypieces should be selected by the architect from a manufacturer's stock, and if not, the surveyor should see the invoice at the settlement of accounts.

The independent valuation of marble is rarely required on the part of the surveyor, except for steps, lavatory tops, or counter tops.

Lavatory tops always cost more when supplied by the sanitary specialist, and some surveyors, when preparing quantities, make a point of separating them from the basins and inclosures. Sometimes the specialist, when his particular apparatus is prescribed, refuses to supply it without the top, in which case the builder is involved in a larger expense than he estimated for, and will claim the extra amount.

The following are a few of the current rates for Sicilian veined marble of the best quality at the merchant's yard, to which must be added the cost of delivery and fixing:—

Unpolished Slabs Sawn to Sizes:—

		s.	d.
1in. lavatory or counter tops....	per ft. sup.	1	9
1¼in. " "	"	2	3
1½in. " "	"	3	0
1in. by 7in. plain skirting	per ft. run	1	1
Mitres to ditto	each	0	6
Moulded ends....................	"	0	8
2in. by 12in. step, square edges, rubbed, but unpolished, not exceeding 6ft. long	per ft. run	4	0
2in. by 12in. ditto, exceeding 6ft. long	"	4	6
Polishing	per ft. sup.	0	9
Polishing edges of 1in.	per ft. run	0	2
" " 1¼in.	"	0	2¼
" " 1½in.	"	0	2½
" " 2in.	"	0	2¾
Polished rounded nosing to 1in.	"	0	5
" " 1¼in.	"	0	6¼
" " 1½in.	"	0	7½
" " 2in.	"	0	10
Polished moulded edge to 1in.	"	0	7
" " 1¼in.	"	0	8
" " 1½in.	"	0	9
" " 2in.	"	1	0
" " 3in.	"	1	2

	Rounded edge.			Moulded edge.

Spandrel steps with moulded nosings, and rebated and splay-rebated joints rubbed but not polished, cost 10s. per foot cube at yard.

The valuation of the fixing will be conducted on the principles of the other masonry, if pinned into walls; but this is rarely the case except for steps. A slab is generally laid on a rough deal top prepared to receive it. Skirtings are fixed with copper screws, or brass cups and screws, to plugs in walls.

As polished marble has always to be packed in a case, the expense of it must be allowed for.

The manufacturer's charge for a case is always exorbitant, but as two-thirds of the original charge is allowed if returned, this does not so much matter. The railway companies make a very small charge for their carriage; but this and conveyance to the railway-station must be allowed for.

Comparative Values of Marble.—Next to Silician marble, St. Anne's is most frequently used. The labour and material may be taken as equal.

For Sienna marble the labour may be taken as equal to, the material about three times the price of, Sicilian.

The weight of marble is generally 160lb. to 170lb. per foot cube.

SLATER.

The work of the slater is frequently sublet by the contractor, though more often in London than in the country. But whether in town or country, it is rarely the case that work is done by the builder's men so cheaply as by subletting. The allowances made for cutting are a compromise between the waste of slates and the extra labour; they usually more than cover the waste of slates. The practice of deducting nothing under 5ft. superficial in area is another small advantage.

The practice of allowing superficial quantity for extra labour is the survival of an old custom, which is inexact and inconsistent with the modern surveyor's methods in other trades.

In London, Welsh slates are those generally used, and are sold by the thousand of 1,200 when bought of local dealers, when purchased by the truck load at the quarry 1,260, the 60 (5 per cent.) being an allowance for those likely to be broken.

Most of the slates of the common designations are supplied of a first and second quality, and the very large ones, as Queens and Rags, are sold by the ton.

The Westmoreland slates are occasionally used in London, and are sold by the ton. They are prepared in promiscuous sizes which the slater sorts when laying, using the largest at the eaves and the smallest at the ridge, the gauge and width of slate consequently gradually diminishing from the starting point. A larger allowance for cutting and eaves is often claimed than that on Welsh slating, and it is necessary to state in a bill of quantities what allowance has been made when ton slating is measured. The sorting in sizes to regulate the diminution also slightly increases the cost.

Stone slates are commonly used in various parts of the country. Some of the oolitic limestones are stratified in very thin layers, and are used under this name. They are found among other places in Northamptonshire, Staffordshire, Oxfordshire, and Gloucestershire. Similar roof coverings are found in Sussex in the neighbourhood of Horsham.

The cartage of slates from local quarries is generally done cheaper by the quarry owner than the builder can do it, and the price agreed should include delivery.

The local allowances for cutting on stone slates is commonly 2ft. for Valleys and 1ft. for Eaves.

Stone slates at Horsham cost delivered 30s. per square; Ditto at Cheltenham cost delivered 25s. per square (about one thousand).

A constant for their laying may be calculated from that for countesses after averaging the sizes of the slates. To this should be added per square slater and boy ·075 for the extra trouble of sorting to diminishing sizes.

Waste.—When the slates are bought by the truck-load, the 5 per cent. allowed at the quarry is sufficient for waste caused by breaking. If bought of the merchant, a further allowance of 5 per cent. should be made. All the other waste is allowed for by the recognised modes of measurement. The waste of nails will vary with the quality of the supervision, but 5 per cent. is a reasonable average. The following table shows the number of slates and nails required for a square of each kind of slating. The existing tables vary, but when the lap is known, the calculation is easy enough, and any doubt can be readily solved.

Taking Countesses, 20in. × 10in. with 3in. lap, as an example, we have 8½in. gauge, then 8½in. gauge × 10in. wide = 85in. surface; then 100 feet × 144 inches ÷ 85 inches = 170, nearly, to each square. The number of nails is two to each slate, and consequently 340. A simple calculation will show the number of squares which 1,200 of the same slates will cover: 85in. × 1,200in. ÷ 14,400in. = 7·08 squares. The designation of the slate is not enough to define its size; it varies with different quarries. The size should always be stated in dealing with slates.

The weights are close approximations, but will vary; they are, however, quite near enough to calculate the cost of carriage and cartage.

Nails—These are commonly of zinc or copper, and are sold by weight. The prices of both vary slightly with the prices of spelter and copper; some of the trade lists quote a price per cwt. beyond the current price of zinc or copper sheet. The price of nails decreases with the increase of length. Sometimes in specifications the nails for slating are described both by their length and their weight per thousand, as "1¼in. copper nails, weight 7lb. per thousand." The following is the weight per thousand of the nails commonly used:

	1¼in.	1½in.	2in.	
Zinc	3½lb.	4½lb.	7¼lb.	per thousand.
Copper	5¼lb.	9½lb.	11¼lb.	" "

The present net price in London for slating nails is as follows:—

	1¼in.	1½in.	2in.	
Zinc	26s.	24s.	23s.	per cwt.
"	2¾d.	2½d.	2½d.	per lb.
Copper	87s.	84s.	84s.	per cwt.
"	9¼d.	9d.	9d.	per lb.

The current prices of first quality Port Madoc slates delivered in London, are as follows:—

	£	s.	d.
24in. by 12in. per thousand of 1,200......	14	17	0
22in. by 12in. " "	13	0	0
22in. by 11in. " "	11	14	6
20in. by 10in. " "	9	8	6
18in. by 10in. " "	7	13	6
18in. by 9in. " "	6	17	6
16in. by 10in. " "	6	10	6
16in. by 8in. " "	5	2	6
14in. by 12in. " "	6	6	6
14in. by 7in. " "	3	12	0
12in. by 8in. " "	3	2	6
12in. by 6in. " "	2	4	6

First quality Bangor slates cost about 10 per cent. more; second quality slates cost about 20 per cent. less than first quality, and are frequently used. It is rarely the case that the specification "best Bangor Countess slating" is carried out.

Delivery.—The prices of slate merchants are usually quoted exclusive of delivery. The weights of roofing slates are to be found in the table relating to the various sizes. The weight of slate slab is easily remembered, as 150ft. supl. of inch thick weighs a ton, and the other thicknesses are in regular proportion,—for instance, 50ft. of 3in. weighs a ton. (The weight will be necessary for the calculation of cost of cartage; see also section Cartage). When there is a load, the slate merchant can generally deliver it as cheaply as the builder can do it himself, and can often be induced to do so free of charge.

Cost per square.—The cost of slating, if sub-let, will vary with the quantity, the larger quantities being done at a less rate per square than the smaller ones.

Labour.—

Slater, per hour..............................	9d.
Boy, ditto	3d.

The cost of a square of Port Madoc Countess slating, laid to a 2½in. lap, with two 1¼in. copper nails to each slate, would be as follows, assuming that the slates were purchased at the current rate in London, allowing 5 per cent. for waste on slates and nails.

	£	s.	d.
165 + 8 = 173 slates at £9 8s. 6d. per 1,000 of 1,200	1	7	2
330 + 17 = 347 copper nails, 1⅝lb. at 9¼d.	0	1	5¼
Slater and boy, preparing and laying, ·200 days at 10s.	0	2	0
Cost per square	£1	10	7¼

With slates smaller or larger than Countesses, the constant may be increased or decreased by a simple proportion, which gives a result very near the truth. Taking slates 12in. by 8in. as an example, the calculation would be 165 : 379 : : ·200 to the constant required, ·459.

For slates larger than Countesses, add ·050 to the constant for Countesses, for extra trouble of handling.

For slating to steep roofs, like Mansard or curb roofs, add to the constant ·050. Sub-contractors charge 6d. to 9d. per square extra.

The same method of proportion may be adopted to apportion the labour of preparing slates for laying,—that is, sorting them for thickness, marking them, and making the holes for nails, constant for Countesses, ·095 days slater and boy.

The calculation for a square of slating, similar to the last, but laid to a 3in. lap, would be as follows. The slate merchant increases his price by about 1s. per square.

	£	s.	d.
170 + 9 = 179 slates at £9 8s. 6d.	1	8	1¼
358 copper nails, 2lb. at 9¼lb.	0	1	6½
Slater and boy (constant increased by proportion) ·206 days at 10s.	0	2	0¾
	£1	11	8½

Spaced Slating.—In open or spaced slating, the spaces vary from 2 to 4in. The difference in quantity of slates may be calculated in the same manner as before. The saving of slates is commonly reckoned as one-third.

Taking as an example Countess slates 20in. by 10in., with 2½ lap and 4in. spaces, we have for the surface covered by a slate 10in. + 4in. × 8¾in. = 122½in.; then 100ft. × 144in. ÷ 122½in. = 118 slates nearly. This, compared with the calculation for continuous slating, is $\frac{118}{165}$, about ¾, a saving of one-quarter. The value of a square would be calculated as follows:—

	£	s.	d.
118 + 6 = 124 slates at £9 8s. 6d. per thousand of 1,200	0	19	5¾
248 nails, weight 1¼lb., at 9¼d.	0	0	11½
Slater and boy preparing and laying, ·193 at 10s.	0	1	11
Cost per square	1	2	4¼

The last constant is arrived at by the proportion 165 : 118 : : ·200 to the constant required—i.e., ·143, and we add ·050 = ·193. It is a common assumption that spaced slating is worth about four-fifths of the price of continuous, and circular one-third to a half more.

Circular slating is valued by the application of the foregoing methods. It is always necessary to use smaller slates, and their size must be regulated by the radius of the curve; and this radius should be stated in the bill of quantities. Much of the circular slating is ill done in a circular roof to a spire or an apse. The perpends should radiate regularly from the apex, and this involves the maximum of cutting. This is frequently avoided by the introduction of slates here and there as closers, and the slating is as a consequence more cheaply done. As circular slating most frequently runs up to a point, the best work is that in which several sizes of slates are used, diminishing from eaves to top, and their selection involves increased labour. The following may illustrate the mode of treatment, assuming a third of the space covered with each of the following sizes, and laid to a 2½in. lap.

Per thousand of 1,200	£	s.	d.
Ladies...... 214 at £6 10s. 6d.	1	3	3¼
Small Ladies 209 at 6 6 6	1	2	0¼
Doubles .... 379 at 3 2 6	0	19	9
3)802	3	5	0½
268	£	s.	d.
268 + 27 = 295 slates at £3 5s. for 802	1	3	11
(In the foregoing has been added a further 5 per cent. for waste in cutting to graduated sizes).			
590 nails, weight 3lb., at 9¼d.	0	2	3¾
Slater and boy preparing ·170, and laying and cutting 281 = ·451 at 10s.	0	4	6
Cost per square	1	10	8¾

All the preceding examples are for slating, exclusive of cutting, and, as before mentioned, these, by custom, are paid for by an allowance of superficial quantity. For valleys the allowance is, for each lineal foot, 6in. on each side, or 12in. in all. The valuation of this may be illustrated by Countess slating laid to a 2½in. lap.

Adopting our calculation for Countess slating, 30s. 7d., the allowance would amount to 3¾d. per foot run. Adopting the market price, 25s. 6d., the allowance would amount to 3d. per foot run.

In slating with a 2½in. lap, the length of cut edge of slates of a single thickness on each lineal foot of raking-line of roof is 3¼in. + 12in. + 11¼ + 2½ = 30in. The slate may be taken as half the width of a Countess slate, 5in.:—

30in. + 5in. ÷ 200in. = ·75 of a slate at £9 8s. 6d. per thousand	1¼d.
Constant for cutting, per foot: 2½ft., slater and boy, ·002 at 10s.	¾d.
Per foot run	2d.

To a valley or hip this calculation would be doubled, and, consequently, 4d. per foot run.

For cutting and double course to eaves, the allowance on Countess slating at 30s. per square, as before, would be equal to $\frac{10}{12}$ of a foot = 3d. per foot run; at the merchant's price (25s. 6d.), 2½d., or—

12in. × 10in. ÷ 200 = ·60 of a slate at £9. 8s. 6d. per thousand	1d.
1ft. cutting = ·002 at 10s.	¼d.
Per foot run	1¼d.

Slating in Bands.—When slating is arranged in bands of different colour and quality it is most conveniently dealt with by finding out the relative proportion of each kind and valuing them separately. The extra labour of arranging slating in bands would commonly be covered by ·10 on the constant for the particular kind of slate described.

Vertical Slating to Walls.—When the gauge is determined on the proportional constant for fixing, and the number of slates may be calculated as before, the preparation of the slates would be equal to that for a roof. The fixing is worth more, averaging about 50 per cent. If a gauge of 8¾ inches be adopted and Countess slates used, the constant would be calculated thus (see example of Countess slating):—

	Slater and Boy.
Preparation	·095
Fixing	·105
Add 50 per cent. on last	·53
Per square	·253

Torching—is the term used to describe pointing inside with lime and hair. For the lime and hair, adopting the calculation for the cost of mortar in Bricklayer, 14s. 4¾d. per cubic yard, and adding thereto the cost of 14lb. of hair at 8s. 6d. per cwt. = 1s. ¾d. = 15s. 5½d. per yard cube.

	s.	d.
The constant is ·200 day of bricklayer per square at 7s. 6d.	1	6
The constant is ·066 day of labourer per square at 4s. 9½d.	0	3¾
⅔c.ft. of lime and hair at 15s. 6d. per cubic yard	0	4¾
	2	2½

(*To be continued.*)

STATUTORY PROVISIONS AGAINST FIRE.

CERTAIN new statutory precautions against the extension of fire, and the means of escape, are suggested by the Building Act Committee of the London County Council in connection with the Building Law Consolidation Bill. These appertain to provisions to give ready access to the roof in case of fire by a dormer window, trap-door, and step-ladder, or other means; to the regulations of factory chimney-shafts, the width and construction of staircases, passages, and doorways of churches and chapels, the regulation of timber-yards and firewood stores, so as to diminish the risk of fire, and other details. Some important amendments are introduced in the rules as to the separation of buildings and limitation of their areas, but the question is whether they are sufficient. Under the present section (xxvii.), separate sets of chambers or rooms tenanted by different persons shall, if contained in a building exceeding 3,600sq.ft., in area, be deemed to be separate buildings, and be divided by party-walls or by party-arches or fireproof floors. This clause has been proposed to be altered by the committee. Subsection (*b*) now reads: "Separate sets of chambers or rooms tenanted by, or *constructed and adapted* to be tenanted by, different persons, shall, if contained in a building exceeding in area 25 *squares*, be deemed each to be a building, and be separated by party-walls or by proper party structures comprising arches and floors of fire-resisting materials." These alterations will, by the words we have emphasised by italics, apply not only to buildings actually tenanted, but also to those built for the purpose of letting to tenants of the area named. The area, too, is reduced by 1,100sq.ft.—an area that will make the clause applicable to a far larger number of buildings let in separate sets of rooms. Under subsection (2) the Council is empowered to exempt buildings used for the manufacture of machinery and boilers of steam vessels beyond the distance of three miles of St. Paul's Cathedral, provided they be of one floor only, and constructed of brick, stone, iron, or other incombustible material, and do not contain more than 216,000c.ft. The Council also reserve power to deal with buildings that the superintending architect and chief officer of the Fire Brigade report have proper arrangements of lessening the danger from fire, and to give consent to additional dimensions; but such warehouse or building is not to contain a number of cubic feet exceeding 450,000, or any less number allowed without being divided by party walls. Such consent, however, is not to be given to any warehouse or building exceeding 60ft. in height above level of street. So far good. According to subsections (*c*) and (*d*), sect. xxvii., of the present Building Act, when any building in one occupation is divided into tenements, each with a separate entrance and staircase, every such sub-tenement is deemed to be a separate building; and any warehouse or other building used wholly or in part for any trade which contains more than 216,000c.ft. is to be divided by party-walls, so that each division shall not exceed that number of feet. Now, these clauses have been, and are still being, transgressed whenever different premises have been acquired and united, and the question is, What provisions of the proposed Act will apply to them? Subsection (2) of section 16, the purport of which we have quoted above, appears to meet this case; but, it may be asked, what are the "proper arrangements" upon which the Council will give consent to additional dimensions? A cubic space of 450,000ft. is very large, and it is questionable whether, even with the limit of height of 60ft., there is not great risk. We would certainly call the attention of the committee to those amendments before they are finally adopted.

We have in our mind a large class of premises which are acquired for trade in every part of the Metropolis. The course is to purchase or lease a number of adjoining houses or shops, and to open communication through the party-walls by means of wide openings, so as to form large showrooms. The several staircases are removed, and only one or two left at the ends. In this united block of buildings a large inflammable kind of trade is carried on. The whole of the ground floor usually is turned into one large shop filled with, say, drapery and combustible articles, and the upper floors are divided into dormitories and corridors of match-boarded partitions, with combustible wooden stairs, often very narrow. The recent fatal fire in Battersea, by which two young girls in a large drapery establishment were burned to death, is a sad exemplification of this kind of conversion of premises, and, as the evidence shows, the means of escape were grievously inadequate, one of the two staircases having been demolished to increase the floor space, while apparently as a result of the substitution of a rolled-iron joist toed into the party-walls for the original partitions on ground-floor, the whole building collapsed twenty minutes after goods caught fire in the shop window.

In the more disastrous fires at Garrould's premises in Edgware-road, some time ago, the same inadequate means of escape were found, and the sections of the Act to which we refer were infringed; for there was not only a much larger cubic space left between the party-walls, but the means of exit were only two windows, inclosed by wooden partitions, and the staircases had been removed to make room for one large shop. The law at present is a dead letter, as it is certainly doubtful if the clauses of the existing Act can be enforced in the case of large stores or shops which do not come under the rules for warehouses. Under the provisions of the new Factory Act, which came into operation on the 1st inst., sufficient exits must be made in case of fire where over forty persons are employed; but in the great majority of these drapery establishments, formed by uniting adjacent shops, and removing one or two staircases, the number of assistants is from a dozen to thirty. This is an anomaly which ought to be rectified at the earliest revision of the Factory Act.

BOOKS RECEIVED.

Electricity up to Date for Light, Power, and Traction, by JOHN B. VERITY, M.Inst.C.E. (London: Frederick Warne and Co.), is a very opportune little manual, designed to furnish the general reader with a popular account of electricity and its several applications. Mr. Verity prefaces his work with a description of the different modes of producing electricity by chemical action, by heat, by friction, and by induction. Of these various modes, that by the dynamo or magnetic induction has been most generally employed. The description of the dynamo is illustrated by a view of the Elwell-Parker continuous-current dynamo, which is a good type. The motive power for driving by water power (a very economical means), by steam-engine, by gas and oil engines is discussed, preference being given to the three first methods. The arc and incandescent lamps are explained and illustrated, and the author refers to several recent arrangements. As he observes, there is still an opening for the invention of a really good arc lamp of small candle-power, the 1,000 candle-power lamps being too powerful for small streets. The "Sunbeam" lamps, to some extent, can be substituted for the arc lamp. These are made from 100 to 500 candle-power. How electricity can be stored by accumulators or secondary batteries is explained in a simple and popular manner, by comparing the accumulator to a gasometer. The Electrical Power Storage Co.'s accumulator cells are illustrated and described, and the author says that in the "best accumulators energy may be stored with a loss on discharge of only about 20 per cent." The very important question of "wiring" a house is worth the attention of architects in specifying. Many useful hints about conductors and their insulation are given. One of the best insulators is indiarubber or jute steeped in a bituminous compound. The rubber is usually vulcanised. The best insulation it undoubtedly is if not adulterated; but this is one of the evils that has to be guarded against. The mode of casing the wires is important, and a section of a wood grooved casing, moulded outside, is given. Care is necessary not to bury the wires in inaccessible places, and perhaps a dado or cornice moulding is the best means. The avoidance of damp is urgent, and every joint must be damp-proof, or leakage of the current will ensue; therefore the wires should be placed in the dryest positions. Other faults are referred to, such as small wires, which are attended with risk by becoming overheated. The need of experience in this work is therefore evident, and the author cautions the reader against "short circuits," or leakage of current from one wire to another, and points to faults that are often met with. The chapters on the arrangement of a private installation, the public supply of electricity by various systems, and the descriptions given of the public supply companies are valuable additions. The Board of Trade regulations follow, and every technical term is explained in a glossary. The other applications of electricity as a motive power and to traction are briefly dealt with in this useful little guide, which should be studied alike by architects and consumers.——We have received a copy of Clarke's *Pocket-Book*, which has just been published by R J. Bush, of Fleet-street, a well printed and neat little book suitable for the waistcoat pocket. A large portion of the contents is quite new matter, and is devoted chiefly to tables and memoranda and calculated results for plumbers, architects, and sanitary engineers. These tables and data have been compiled and calculated by Mr. J. Wright Clarke, the plumbing instructor to the Polytechnic. In addition to the usual tables of weights and measures, proportions of circles, the physical properties of metals, there weight and contraction, the linear expansion of metals, lightning conductors, fluxes for brazing and soldering, sizes and weights of lead pipes, velocities of flow through pipes, sizes and contents of cisterns are given, and many notes and data furnished about water supply and plumbers' work, on which the ordinary architects' and engineers' hand-books are silent. The useful memoranda are full of results that will be of every day use to the architect, surveyor, and engineer, as they have reference to all the building trades, to hydraulics, heating, and sanitary engineering.——*The Hydropathic Establishment and its Baths*, by ROBERT OWEN ALLSOP, Architect, author of the "Turkish Bath, &c." Illustrated (London: E. and F. N. Spon).—The useful and interesting series of articles which appeared in the BUILDING NEWS on this subject has been republished by the author, who has revised the matter and brought it up to date. Mr. Allsop's works on Baths supply a place in the literature of this particular class of buildings, for the subject is one that cannot be said to be hackneyed. We have had more books about houses and cottages than we know what to do with, more, certainly, than ever ought to have been published for the reputation of their authors. But the Turkish bath and hydropathic establishment are matters about which little practical knowledge is known by the ordinary architect. The text is well illustrated by plans of many of the principal baths. It would be superfluous here to notice in detail the work, it having been so recently given in our pages. Mr. Allsop makes some very useful and cogent remarks in the first chapter on the hydropathic establishment. Such an establishment, he says, should be rurally situated; it must not be a mere hotel with baths tacked on, but combine the comforts of a residence and a sanatorium. Many of the establishments used for this purpose have not been planned on any system; old residences or hotels have been converted into these institutions, without any suitable accommodation. In a well-considered design the residential apartments must be arranged in relation to a set of baths. Each suit of bath-rooms must be self-contained for its particular use. The Scarborough Hydropathic Establishment, of which a plan is given, is an example of a complete building for a certain site. The author points out what are the conditions of success, and the faults of arrangement and management observed in many establishments, which are mere make-believes, and have done incalculable injury to the true system of hydropathy. The practical requirements are clearly pointed out and examples given. The arrangement and details of baths and their appliances, vapour and Russian baths, douche room; massage and electrical treatments, with plan of a bath house; pulverisation and the Mont Dore cure, inhalation, and the sun bath, with plans for each treatment, are discussed. Mr. Allsop's little book will be found of value to architects and others engaged in designing or establishing baths of this description, and the medical profession cannot fail to derive many useful hints from its perusal. The plans are well drawn to a readable scale.

At a meeting of the architectural section of Glasgow Philosophical Society on Monday, in the rooms, 207, Bath-street, Glasgow, Mr. J. B. Sutcliffe read a paper on the warming and ventilation of public buildings.

At the meeting of the London County Council on Tuesday, a letter was read from the Local Government Board confirming the announcement already made, that it is intended to appoint a Royal Commission to consider the question of the London water supply. Satisfaction was expressed at the Government having adopted that course.

Building Intelligence.

ADLINGTON. — New branch premises have just been completed at Adlington for the Williams Deacon and Manchester and Salford Bank, at a cost of £2,500. The premises occupy a commanding corner site in Church-street, facing the Market-place. The building is Classic in style, and constructed of Yorkshire stone parpoints with polished stone dressings. The spacious entrance-hall opens into the banking-room and the consulting-room. Below the banking-room is the strong room, which is fitted with patent fire and thief-proof door and frame, and paved with encaustic tiles, and also a lavatory. From the banking-room an internal doorway leads to the residential part of the premises, which have also a separate entrance from a side street. The doors and windows to the entrance-hall, and banking and consulting-rooms, are of American ash, the internal window linings having walnut panels. The entrance-hall and customers' portion of the banking-room are laid with mosaic pavement. The remainder of consulting-room and banking-room are paved with oak blocks laid on concrete. The whole work has been carried out from the designs, and under the superintendence of, Messrs. Jolly and Buckley, architects and surveyors, of Chorley, Lancs. The work has been executed by local tradesmen.

ST. PAUL'S CATHEDRAL CLOCK.—After much consideration of plans, the Dean and Chapter have just commissioned Messrs. John Smith and Sons, Derby, the well-known clockmakers, to make a new clock to replace the old one in the south-west tower of the cathedral. The old clock strikes the hours on the old "Phelps" bell, but the new one will strike upon "Great Paul," which is nearly seventeen tons weight, with a hammer weighing 680lb. The quarter-chimes will be struck much the same as before, but provision will be made in the clock so that chimes on four bells may be added at a futnre time. The two dials, which are 16ft. diameter, will be unaltered, except that the central part will be arranged for illumination at night. The clock movement will be a very large piece of machinery, designed by Lord Grimthorpe, and it is guaranteed by Messrs. Smith and Sons to keep time with very great accuracy. There will be special precision apparatus, whereby the first blow of the hours will fall within one second of Greenwich time, and the first blow of the three-quarters will also strike with the same accuracy. Some idea of the great size of this clock may be formed when it is known that the hammer which strikes the bell is 680lb., while the hammer which strikes "Big Ben" at the Houses of Parliament is about 450lb.

SHEFFIELD.—New board schools in Gleadless-road, Heeley, were opened on Monday. The schools, which have been built by Messrs. W. Ives and Company, contractors, of Shipley, are erected from the designs of Mr. C. J. Innocent, of 17, George-street, Sheffield. The plans present several new features. In the school for boys and girls each department has a large room and five other rooms, which can be used for class teaching, with an arrangement by which a number of them can be thrown together for general purposes, and thus obtain an assembly hall. There has been accommodation provided for 420 boys 420 girls, and 360 infants. The infants occupy a separate building, and here the general school-room and class-rooms have been arranged on an entirely new plan. In each department there are two rooms set apart for the use of the teachers. The cost of the site, which occupies 7,580 square yards, is £2,530; and the cost of the building, including the furnishing, is £11,170, making a total cost of £13,700. As the accommodation is for 1,206 children the cost per head for the site amounts to £2 2s., and for the building and furnishing £9 5s. 2d., the school thus costing per head £11 7s. 2d. Mr. Cartwright has acted as clerk of works.

The Duke of Connaught is carrying out some important improvements in the gardens and park of Bagshot House. The immediate surroundings of the mansion are being laid out by Mr. H. E. Milner, but the remoter portions of the grounds will be dealt with so as to preserve their natural character. On the Windsor side a new approach is to be made.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—M. W. L. Co.—H. E. D.—C. J. Fothergill.—B. and R. Co.—J. T., Manchester.—R. L. G.

Correspondence.

ANIMALS FROM THE OUTER WALL, CARDIFF CASTLE.

To the Editor of the Building News.

Sir,—Please correct errors that have appeared in the Building News for Jan. 1 and 8, 1892. In your notice of the illustrations of the animals upon the outer wall of Cardiff Castle, the late Mr. Burges's name is given as architect, and Mr. T. Nicholls, sculptor. The latter name is correct, the former is not. Mr. Burges had nothing whatever to do with any portion of this work, which was carried out entirely by—Yours, &c., William Frame, Architect.

Cardiff, Jan. 12.

ADVERTISERS' TRADE RIGHTS.

Sir,—In your advertising columns of last week's Building News there appears an advertisement relating to infringement of the advertiser's trade rights, and offering a reward of two hundred pounds sterling to any person furnishing evidence of any such infringement that shall secure the conviction of the guilty parties.

Without commenting upon this advertisement in any way, I shall take its reference to the Merchandise Marks Act in the general application, and not as one specially referring to the merchandise of a certain individual only, for an illustration of what I wish to bring before your readers.

The question I desire to propound is this: Is the Merchandise Marks Act so inefficient, and commercial morality so debased, as to require the stimulus of such large rewards to induce purchasers to give their aid in protecting the rights of others? I will not venture a reply to this query, but will only refer to certain matters which come weekly before the public through the advertising columns of many papers, and before architects especially through the medium of trade catalogues furnished to them by manufacturers of building and other appliances, and offer at the same time a suggestion by which a large amount of "fradulent substitution" might be prevented.

During the course of a limited experience in connection with the building trade, I have had opportunities of observing the introduction of many useful inventions in varied designs, and have noted that where these have been patented, registered, or guarded by trade marks, there has been a certain amount of protection afforded to the inventor, designer, or manufacturer to reward him for his labour, in so far that unscrupulous parties were deterred from infringing so closely upon these patents or designs as to bring them within the grasp of the law, and have confined themselves to imitations as near as it was possible to come without risk, hoping by holding out the bait of lower prices to have their imitations substituted. When not so protected, however, I have likewise noted that there has been no scruple in copying inventions and designs to the minutest detail, and in some cases with very slight, if any, modifications. Such copies have been put before the public as the advertiser's own design and invention, patented and registered, and sold with patent labels affixed, when neither the form of patenting or registration had been gone through, nor any fees paid for such.

Such shamefaced piracies as those referred to, which rob the inventors and designers of the reward of their labour, do not deserve the patronage of the public; yet they obtain it simply because they are sold cheaper, and it is probably unknown that they are not original patented inventions or registered designs. Still, it is observable that they are, if not altogether, very close imitations of other people's goods.

I have an idea that the architectural profession can do much to strengthen these trade protective Acts, put a stop to many of these malpractices, and aid the honest inventor. I grant it is their interest to obtain as cheap and reliable appliances for their clients as it is possible to find, and these goods are usually put before them as improvements upon the real patents and designs; but the honourable character of the profession stands clearly out against the encouragement of such dishonourable practices, and they can, by their discrimination, become powerful and influential factors in the interest of the genuine inventor and manufacturer.

It must not, however, for a moment be supposed that I make the slightest suggestion that the members of the architectural profession have not hitherto given their discouragement to such practices when they have been observed by them; but it is possible that they may, in many instances, without being aware of it, have given their patronage in their favour, and this suggestion may lead to inquiry.—I am, &c.,

Jan. 16. S. D.

* * *

The Dean and Chapter of Norwich have requested Mr. J. L. Pearson, R.A., to report on the condition of the fabric of Norwich Cathedral.

The addition to the Prestwich County Asylum, near Manchester, is being warmed and ventilated by means of Shorland's patent Manchester stoves, those already in use in this asylum having given entire satisfaction, the same being supplied by Mr. E. H. Shorland, of Manchester.

Intercommunication.

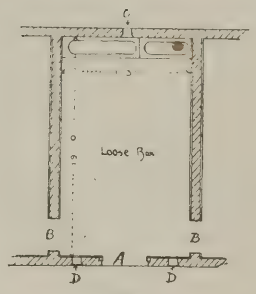
QUESTIONS.

[10702.]—**Bookkeeping.**—Could any kind reader recommend a good textbook on bookkeeping for plumbers and house decorators?—Pictor.

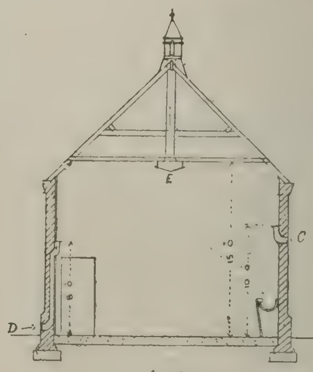
[10703.]—**Deal Floors on Concrete.**—In some workmen's dwellings I am anxious to lay ordinary deal flooring, tongued, directly on concrete composed of coke-breeze and Portland cement, to which the flooring would be nailed. Will any of your readers kindly state their experience of floors so laid? Are the boards liable to "cockle" or to decay more rapidly than if laid on joists? If they are, what is the best means of getting over these objections. "Block" flooring would be too expensive.—Surveyor.

[10704.]—**Fascia.**—I am much obliged to "G. H. G." for answering my last query. Will he kindly inform me how a stone fascia should be fixed to a box girder as well as a rolled iron joist? I suppose the soffit is usually only the thickness of the stone casing, which, I presume, is kept from dropping by means of joggled joints, the copper ties he refers to being for the purpose of keeping the stonework from bulging outwards. Can he recommend me a cheap book on practical iron construction?—Excalibur.

[10705.]—**Ventilation of Stables.**—I may say I am engaged in building a range of stables consisting principally of loose-boxes, which I have arranged to ventilate in the following manner. As, however, my system has been criticised and condemned as wrong in principle by a friend of the gentleman whose horses are to occupy the stables (thereby raising doubts in the mind of the latter), I have thought it wise, before proceeding with the work, to give others the opportunity of criticising the proposed system. I now give a plan and section of the boxes, the dimensions of which are as follows:—19ft. deep by 11ft. 3in. wide, and 15ft. high to the ceiling under the collar-beam. As will be seen, the entrance door A is in the centre. opposite the manger, over which there is a falling fanlight opening inwards when desired. There are also small communicating doors, B B. which enable the horses to be inspected more conveniently than would be the case had each box to be entered from the outside. However, it is with ventilation I have to deal. At D D, on either side of the entrance door, are two inlets 9in. by 4½in., built in the wall in the form of a Tobin's tube, admitting the pure air through a grating 9in. from the ground line, and delivering it vertically into the box by means of a regulating bracket 8ft. from the floor. There is also a similar bracket over the manger at C, delivering at the height of 10ft., but in this case the inlet grating is 8ft. from the ground on account of construction. At E is the outlet for vitiated air, protected by a cone 6in. from the ceiling, and terminating above the ridge with a Boyle's patent air-pump extractor. The above is the principle of the proposed system of ventilation which has been condemned as wrong on account of the height at which the pure air is delivered into the boxes. This, it is thought, ought to be considerably lower, say, from 2ft. to 3ft. from the floor of the box, as it is asserted that the fresh air, on being admitted at the height of 8ft., will fall on the back of the horse, whereas, if introduced at the lower level, no downdraught would occur. With this I cannot agree, as in my opinion the danger of draughts would be greatly increased rather than averted, to say nothing of the general principle being wrong.—H.



Plan



Section.

[10706.]—**Safe Load.**—I shall feel obliged if some of your correspondents will tell me what is the safe load for a rectangular cast-iron column 7½in. by 6in. by ¾in. thick, and 13ft. high.—Subscriber.

[10707.]—**Fan-Vaulting in Brick.**—Can any correspondent inform me of any examples of modern fan-vaulting in brick, or give any particulars of the cost of executing such work?—Bricky.

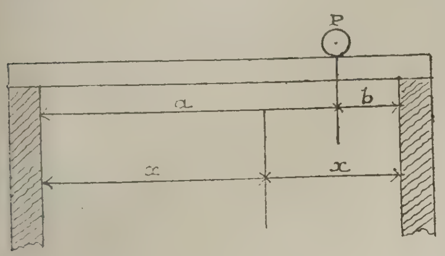
REPLIES.

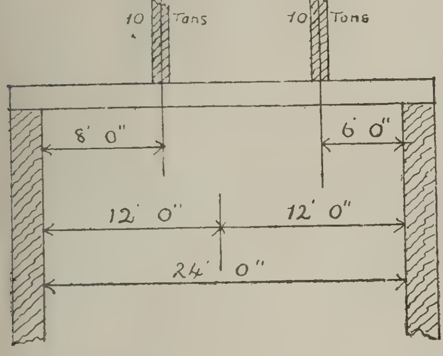
[10689.]—**Earth-Closets.**—"E. C." can obtain full information and all advice respecting earth-closets by writing to Mr. J. Ward, 203, Tonge Moor-road, Bolton.—Compton.

[10695.]—**Bricks and Brick Making.**—Hand-machines are out of date for making any considerable quantity of bricks in our days. "Currie" may see several large and small Hoffman kilns, both circular and oblong, in full work at Scarborough.—G. B.

[10684.]—**Strength of Materials.**—Hurst's rule is: "If the load is applied at any other point, as at D, the breaking weight will be equal to the square of half the length of A B multiplied by the breaking weight in the middle, and divided by the product of the distance

A D and D B from each end"—or, in other words, the breaking weight at the point P = the breaking weight in the centre $\times \frac{x^2}{af}$. From this it follows that the breaking weight in the centre = the breaking weight at point $P \times \frac{af}{x^2}$. Applying this to the problem in the examination referred to by "A. R. F. T," the weight in the





centre equivalent to the 10 tons at left-hand side $= 10 \text{ tons} \times \frac{2 \times 4}{3 \times 3} = \frac{8}{9}$ of 10 tons; also the weight in the centre equivalent to the 10 tons at right-hand side $= 10 \text{ tons} \frac{3}{2 \times 2} = \frac{3}{4}$ of 10 tons; therefore, total weight in centre equivalent to the two weights of ten tons each $= \left(\frac{8}{9} + \frac{3}{4}\right)$ of 10 tons $= \frac{59}{36}$ of 10 tons.—J. W.

[10698.]—**Building Line.**—By the Public Health (Buildings in Streets) Act, 1888, section 3, section 156 of the Public Health Act, 1875, is repealed, and in lieu thereof it is enacted that it shall not be lawful in any urban district, without the written consent of the U.S.A., to erect or bring forward any house or building in any street, or any part of such house or building beyond the main front wall of the building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same. My opinion is that any person may set his building back from the building-line if he cannot bring it forward.—G. B.

[10698.]—**Building Line.**—You can set your buildings back as proposed, and the corporation have no right to stop you. Better proceed cautiously, under the advice of an architect or solicitor who has a knowledge of Building Acts and local by-laws.—ARCHITECT.

[10700.]—**Traps.**—I would suggest to "R. A." that he take out the 4in. trap and put in a 6in. trap of any good make, and, say, four lengths of 6in. pipes, with a taper pipe into the 4in. drain. I think this would remedy the evil complained of. A 4in. trap to a w.c. is too small. —G. B.

[10700.]—**Traps.**—There must be something wrong with the fitting in of the Buchan's 4in. trap, or the pipes beyond it, if it requires to be cleared out every fortnight, as "R. A." says. Is it a No. 1 or No. 2 trap, or what style? With the No. 1 trap, I found that masons and others putting it in, often left the cement sticking up inside of the pipe beyond the trap, and so I brought out the No. 2 style, with the access opening at its outer end, to leave no excuse for tradesmen making a bad job. As thousands of these traps are in use in all sorts of buildings all over the kingdom, and work well, many as clean or clear after ten years' use as in the first week, I think "R. A." should see, first, that the trap is a real Buchan's trap; second, that it is properly fitted in, with a fall for the water into the trap of 2in. over the sharp edge; third, that the drain-pipes beyond the trap are clear, and no cement left sticking up inside of the pipes at the joints. Many pipes work well, when properly laid, with less fall than 1½in. to 10ft.—W. P. BUCHAN.

[10701.]—**Ventilation.**—"C. W. S." asks as to the "best" method of ventilating a public hall "surrounded by adjoining buildings on all sides." In that case, and especially if the adjoining buildings are higher than the ridge of the hall, the wind would not get at any wind-acting exhaust ventilators to make them work; hence for the "best" method of ventilating this hall some other motive power than the wind should be depended upon, say, either by using gas in the outlet pipe to cause an up-current, or by the use of a ventilating fan worked by a gas-engine, or otherwise.—W. P. B.

◆

Colonel Ducat, Local Government Board Inspector, held an inquiry at Rochdale on Thursday concerning an application by the corporation for permission to borrow £60,000 for the extension of gasworks, and £3,500 for fire-brigade purposes.

Legal.

COMPENSATION FOR LEASEHOLDS.

WHEN leasehold premises are taken by railway companies, or for purposes of improvement under the compulsory clauses of a statute, the value of the lessee's interest depends upon various considerations. It is clear that in assessing the compensation he is to receive all the facts affecting the value of his property at the time of the notice to treat should be considered. In the recent case of "McIntosh and the Pontypridd Improvement Company, Limited" (*Times*, Jan. 13), a very important point of principle and justice was laid down by the Court of Appeal. There the lessee held a piece of land with buildings on it by an under-lease, with about 50 years unexpired. But it appeared that the lease gave power to erect new buildings on the land, subject, of course, to the lessee's covenant as to their repair. In fact, the plaintiff had prepared plans for such new buildings, and had had them approved by the local board. As to whether other points were raised, that need not now be gone into. It further appeared that, as a matter of fact, the consent of the lessor to this pulling down and rebuilding had never been withheld in cases of other leases containing similar clauses, and it would have been granted here when asked. The arbitrator to whom the claim for compensation had been sent submitted two questions to the Court—firstly, whether the lessee was precluded by his lease from pulling down and rebuilding, when the value was put at £306; and, secondly, whether the lessee could use the land as a building site, when the value would be £1,569.

The Divisional Court had held that the latter sum was the proper amount of compensation, whence this appeal. The Master of the Rolls ruled that, in construing the questions asked by the arbitrator, the Court could go into the facts, and did so accordingly. They therefore included in his second question the fact that the lessor's consent to pulling down and rebuilding had always been given in similar cases, and would have been given here if asked. The point, then, was whether, under these circumstances, a purchaser would give more for the lease than if the fact of such consent being practically certain did not exist. The Court laid it down that the value to the lessee at the date of the notice to treat must be taken, and the arbitrator would be entitled to take into account anything which, as between vendor and purchaser, would enhance the value of the land to the lessee. It was perfectly clear that this fact would so operate to heighten the value of the land to the claimant, and therefore the arbitrator must take it into consideration. The Court of Appeal then confirmed the judgment of the Court below upon this broad ground, and so the valuation for compensation stood at £1,569, though without this implied consent to the lessee's pulling down and rebuilding the assessment of the lease would only have been £306, so that this point made a difference of just £1,250 to the lessee, and is worth noting for future use upon similar claims.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

CH. H.—CONTRACT.—The work ought not to have proceeded until the priced bill of quantities was sent in, and the contract completed. The only course to pursue now seems to be to refuse any payment or certificate until the contractor has complied with the requirements of the contract in this respect; and if the contract has been carefully drawn, he can do nothing without the certificate.

COSMOPOLITAN.—PATENTS.—The proper course to pursue would be for you to get out a provisional specification of your improvement, and when thus protected you could negotiate with the patentee of the article you can improve.

J. H.—STREETS.—The surveyor seems to be right by the existing by-laws. The suggested inference of former approval is more matter of fact than of law, and does not appear strong enough to be acted upon. As to the School Board, this would probably depend on the contract itself.

◆

The county council of Ayrshire have adopted a scheme by Messrs. Leslie and Reid, of Edinburgh, for the construction of intercepting sewers and sea outfalls for the village of Fairlie.

LEGAL INTELLIGENCE.

BROSELEY TILES—CUSTOMS OF TRADE.—A case of considerable importance to architects, builders, and persons interested in the building trade, was heard on Wednesday last before His Honour, Judge Harris Lea, at Madeley County Court, Shropshire. The litigants were the Broseley Tileries Company, Limited *v.* Cooper Brothers. Mr. H. J. Osborne, of Birmingham, appeared for the plaintiffs, and Mr. Herbert Nield, of London, represented the defendants. The plaintiffs are tile manufacturers at Broseley, and the defendants are merchants, carrying on business in King William-street, London, and elsewhere. The case occupied the greater part of the day, during which time the court was crowded, most of the manufacturers in the district being present. From the evidence it appears that the defendants, who are large buyers of roofing tiles, wrote the plaintiffs to know if they had 30,000 strawberry-coloured tiles in stock, to which the plaintiffs replied that they had only 10,000 of the colour, and submitted samples, which were satisfactory, and from which a sample truck was ordered and sent. On arrival the truck was rejected, on the ground of colour differing from sample. The truck was eventually unloaded by the railway company, and it was then seen that two-thirds of the tiles were also second quality—i.e., having fine cracks, warps, scum, and other defects. The plaintiffs alleged that it was impossible to send the tiles nearer in colour than they had done, and called several witnesses, mostly manufacturers, who, although they acknowledged that the price charged was the standard association price for the best quality goods, alleged that 25 to 50 per cent. of tiles differing in quality and colour to the samples submitted would be fair representations of best quality in bulk, according to the custom of the trade. This the defendants denied, and submitted that having had many years' experience in the trade, they declared that not more than 2½ per cent. of seconds, and variations in colour from one shade lighter to one shade darker would fairly represent best quality in bulk, and called several merchants of many years' experience to substantiate this. His Honour, in giving judgment, said that the evidence of the plaintiffs was not so reliable as that of the defendants, as the statements of the respective witnesses varied considerably, whereas the evidence given for the defence was particularly clear, and notwithstanding the alleged customs of the trade, or of an association of manufacturers, he considered that the goods supplied were not fairly representative of the samples submitted, and he should therefere give a verdict for the defendants on both the questions—viz., colour and quality. Mr. Nield then applied for costs, to be awarded on the higher scale, on the ground of the action being particularly a test case, in which a large body of manufacturers were interested. His Honour agreed, and certified for two days' costs to each witness.

IN RE MARK GENTRY.—(Before Mr. Registrar Hope.)—This debtor has petitioned the Court, describing himself as of 43, London Wall, also of Sible Hedingham, and Langthorne Works, West Ham, builder, contractor, brickmaker, and farmer. The usual receiving order was made. The liabilities secured and unsecured are returned at £34,000, against assets £3,000.

IS A SCREEN WALL A "STRUCTURE"?—At Wandsworth Police Court, last week, Mr. J. E. Jennings, residing at Ilminster-gardens, Lavender-hill, was summoned by the London County Council for causing to be erected a certain structure beyond the general line of buildings in Falcon-road, Battersea, without first obtaining a license in writing. The property in Falcon-road consisted of shops, and an application was made to the Council for permission to extend the shop fronts on to the private property of the owners. This application being refused, a brick wall several feet high was erected on either side of the shop front at 72, Falcon-road. In respect of this Mr. Jennings was summoned. On his behalf it was contended that the walls could not be considered a structure, but were screens which he had a perfect right to erect to prevent a trespass on his premises. Mr. Denman decided against this contention, and made an order for the demolition of the walls, with three guineas costs.

IN RE D. W. LEWIS and SON.—One Portsmouth failure in direct connection with the crash of the Building Society is that of Messrs. David William Lewis and Henry David Lewis, builders, of Ottawa-terrace, Victoria-road, Southsea, trading as D. W. Lewis and Son. The first meeting of creditors will be held on Tuesday next, in London. The summary of the statement of affairs shows the sum of £3,390 12s. 5d. as due to unsecured creditors. The amount due to fully secured creditors is £62,403 9s. 2d., the debtor estimating the value of the securities in question at £65,807 11s. 3d., showing a surplus of £3,404 2s. 1d. To partly secured creditors the sum of £30,799 18s. 3d. is due, less £6,999 2s. 1d., the estimated value of securities. The assets amount to £6,629 6s. 5d. The doubtful and bad debts are estimated to produce £388 10s. 1d. The deficiency is returned at £21,462 2s. 2d. The failure is attributed to loss on contracts for sewerage work at Richmond, and on unlet property and repairs. The bankrupts, who filed their own petition, have only been in partnership about three or four months, the son having recently joined the father, but brought no capital into the business. The father commenced business about 24 years ago without capital. For the past 21 or 22 years he states he has been financed by the Portsea Island Building Society, who are now shown as fully secured creditors for £51,481 12s. 9d. The estimated value of the securities held against this sum is £49,597 11s. 3d.

Re Peter Balmer.—In the Liverpool Bankruptcy Court, application has been made for the discharge of this bankrupt, who was an architect and surveyor in Ormskirk and more recently in Liverpool, and failed in 1886. The debts amounted to £25,441 and assets to £57. No dividend had been paid. The bankrupt mainly attributed the loss of the money to his having become surety to a Southport bank for advances to companies of which he was a director. The official receiver, in his report, alleged that the bankrupt had failed to keep proper books of account. His Honour granted the discharge, subject to a month's suspension.

In re Improved Villa and Cottage Homes General Land and Building Company (Limited).—Under a winding-up order made against this company on Oct. 31 last, accounts have now been submitted showing liabilities £4,082, of which £1,156 are unsecured, without any available assets, and, as regards contributories the deficiency is returned at £1,741. The company was registered in October, 1887, and was formed for the purpose of erecting artisans' dwellings, which were eventually to become the property of the tenants. With this view the company, in December, 1889, entered into an agreement for the purchase of 7¼ acres of freehold land at Thornton Heath. On the completion of the purchase it was discovered that the value of the property for building purposes had been overestimated, and the vendor, about May, 1891, agreed to take back about four acres of it, and to reduce his charge to £90. The insolvency is attributed to want of capital to carry on the necessary building operations, and an account has been filed explaining the deficiency.

In re R. G. Guy.—(Court of Bankruptcy, Jan. 28.)—The bankrupt was a timber merchant, formerly trading in London in partnership with Lampton L. L. Bevan as George Guy and Co., and at St. John's, New Brunswick, as Guy, Bevan, and Co. The failure occurred in March, 1887, the joint liabilities being returned at £105,229. The assets were estimated to realise £25,423, but they are reported by the trustee to have realised only £2,116. The partnership between Messrs. Guy and Bevan was commenced in 1878, and the failure was attributed to the result of certain accommodation transactions. Further, that after March, 1882, the bankrupt, having parted with all interest in "Guys," continued the management of the business, and to enable him to raise the necessary funds for this purpose, he put into circulation accommodation bills drawn by him in the name of Guy, Bevan, and Co., and accepted by him in the name of George Guy and Co, which he discounted with third parties. The amount of the bankrupt's liability in respect of these bills was nearly £10,000. He also incurred liabilities on bills drawn or accepted by him which were unprovided for by him at the date of the receiving order to the amount of £70,000, and with the proceeds of these bills the business was continued, the trade falling off, and the business becoming hopelessly involved. The Official Receiver reported as offences rash and hazardous speculations, contracting debts without reasonable expectation of being able to pay them, and that the bankrupt had given an undue preference to one of his creditors. Mr. Registrar Giffard, in giving judgment, said that the vital point in the case was the circulation of the bills to which reference had been made, and he could not suppose the bankrupt did not know that the Messrs. Stewart were in desperate circumstances when they had to raise at least £60,000 on accommodation bills. Rash and hazardous speculation was a very mild term to apply to the transactions, and the bankrupt's discharge would be suspended for four years.

Employers' Liability.—The question whether injuries sustained from defective works when pulling down buildings entitled a person to compensation under the Employers' Liability Act, in the same manner as when a building was being erected, came before Justices Lawrance and Wright on Wednesday. A labourer named Brannigan, when engaged in clearing a site for the building of a new theatre at Ashton-under-Lyne, was injured by the fall of a wall, and he recovered nearly £200 damages from his employer, a Mr. Robinson, who appealed. Their lordships dismissed the appeal, but gave leave to further appeal, in order to have some novel points argued.

The Fatal Fire at Lavender-Hill.—The adjourned inquest on the two draper's assistants, Mary Medlam and Ada Dodd, who lost their lives in the fire at Messrs. Minnis' premises, Lavender-hill, on the 20th ult., was held by Mr. Braxton Hicks at the Vestry Hall, Battersea-rise, on Thursday, the 14th inst. Under an order of the London County Council, Mr. Frank Job Chambers, F.R.I.B.A., of College-hill, London, E.C., sat with the coroner as assessor, and a well-known clerk of works was foreman of the jury. The case was watched on behalf of the Home Office, the County Council, the fire brigade, the police, the Southwark and Lambeth Water Company, and of one of the deceased. Mr. Minnis, the occupier of the premises, stated that the premises consisted of Nos. 307 and 309. When he took possession in 1889, the staircase of 309 had been taken away, and the only communication with the upper floors was by the old staircase of 307. Certain alterations had been made, including the removal of the partition on the ground floor, and the insertion of an iron girder; the plans for these alterations were not submitted to Mr. Wilfrid J. Hardcastle, the district surveyor. Evidence having been given as to the supply of water, Mr. Hardcastle said in 1888 the premises were altered from private houses, but no notice was given him, and on visiting the works, he saw no plans. He did not know that the chimney breasts in these premises had been cut away, without a certificate being obtained from himself, as required under Section 20, clause 15, of the Metropolitan Building Act of 1885; nor did he see that the iron joists which replaced the partition had been simply let into the party-wall 4½in. instead of being carried on piers. The landings of the back staircase were concrete on ordinary wooden joists; he did not consider that a proper foundation. In reply to Mr. Chambers he said that the whole of the weight of the upper floors was carried on a rolled iron joist 10in. by 4½in. The joist, he admitted, was very much too weak, and would only carry eight tons. In consequence of this yielding to the flames the whole building collapsed. He did not notice at the time that the walls were not thick enough.—In conformity with the Act, Sec. 52 and 53, he sent in his report to the London County Council at the completion of the work, but did not mention the various infringements of the Building Acts, although he knew that the said report signed by himself constituted a certificate that all the works were completed in accordance with the Building Acts.—The inquest was then adjourned till yesterday (Thursday), when Mr. Hardcastle was represented by Mr. G. W. Bernard, solicitor. Mr. Horace Turner said he sold the shops to Minnis. He had nothing to do with the building operations, except to finance the builder, Mr. Ingram, trusting everything to the person who made the specifications. Witness knew there was no back exit from No. 309, the doorway having been bricked up by Minnis's instructions. He could not say that this was done to avoid the Building Acts, but admitted that the operations were not carried out as he should now like. Knowing nothing about the alterations, he had assumed that the district surveyor had been acquainted in the ordinary course. He did not know that plans had not been sent, and that Mr. Hardcastle only visited the premises in a casual manner. The vestry had nothing to do with the inside construction, but were favourable to the shops being built, having made a compromise with the freeholders regarding the two feet of frontage on which the shops were brought forward. The Metropolitan Board of Works, then in existence, were unfavourable to the proposal, and refused the application several times. Mr. Thos. Ingram, an auctioneer and surveyor, who carried out the alterations in Nos. 307 and 309, Lavender Hill, a Mr. West acting as foreman under his instructions, said he brought the frontage out 6ft. by request of the Metropolitan Board of Works, putting two girders under the front and one under the bay window. He sent in the plans to the vestry, also notifying Mr. Hardcastle of the fact. No. 309, however, had got three planks bolted together, this being the only shop so treated. The bresummers were supported by pillars of brick and cement. In August, 1889, he converted the two shops into one. He gave notice verbally to the district surveyor. Hardcastle could not have helped noticing the alterations, as he had to pass every day to go to his office. He was not obliged to submit plans of the internal construction, although he had to give notice. The case was then adjourned till next Thursday, when Mr. Hardcastle's examination is expected to be resumed.

◆

A granite drinking fountain with cattle trough, &c., surmounted by lamp, is to be erected at Compton, near Wolverhampton. Mr. J. Roddis, of Birmingham, will execute the work.

STATUES, MEMORIALS, &c.

Chichester.—The Dean and Chapter of Chichester, acting under the advice of their architect, Mr. Gordon M. Hills, of Adam-street, Adelphi, W.C., have just had the vacant Early English niche in the south-west porch of the Cathedral filled. The statue is a standing one of St. Richard, the famous 13th-century Bishop of Chichester. He is in full canonicals, and holds a crosier in his left hand, whilst the right is lifted in the act of benediction; at his feet is a chalice. The statue, which is just under life size, is from the studios of Messrs. Harry Hems and Sons, of Exeter.

WATER SUPPLY AND SANITARY MATTERS.

Sewage Purification at Birkdale.—Major-General C. Phipps Carey, R.E., of the Local Government Board, recently held a public inquiry at the Town-hall, Birkdale, about the disposal of the Birkdale sewage. The lime treatment of the sewage having produced bad results, the Southport Corporation obtained an injunction against the Birkdale local board for polluting a brook. To remove this injunction the Birkdale board proposed to continue treating their sewage with lime, but carrying their effluent therefrom through a pipe sewer into the sea. This was opposed by the corporation of Southport and by neighbouring landowners. Dr. E. Frankland, F.R.S., of the Rivers Pollution Commission, and Mr. Mansergh, M.Inst. C.E., gave evidence for the Southport Corporation against lime treatment of the sewage. These eminent authorities recommended the Ferozone and Polarite process of the International Company, as, in their opinion, it would produce the most satisfactory results, and would be less costly than the method proposed. After hearing this evidence, the representatives of the Birkdale Local Board withdrew, and, after a short deliberation, announced their willingness to give an undertaking to adopt the International process, whereupon the opposition of the Southport Corporation and the other opponents was withdrawn. The Birkdale Board have accordingly instructed Mr. Charles H. Beloe, M.Inst.C.E., of Liverpool, the consulting engineer to the International Sewage and Water Purification Company, Westminster, to prepare the scheme, in conjunction with Mr. J. H. Fairbairn, the surveyor to the board.

CHIPS.

Mr. Alfred Palmer has been appointed Master of Design in the Leeds School of Art.

Alterations have been made to the Drill Hall, Pentre, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The Perthshire County Council have adopted a scheme for the extension of the special water supply for Pitlochry district by bringing in an additional supply from Altassen burn, belonging to Mr. Buttar, of Faskally. According to the report of Messrs. Leslie and Reid, of Edinburgh, the engineers, the cost of the extensions will amount to £2,942.

It is intended to cover with a glass roof the central court of the South Kensington Museum, and devote the hall thus gained to the reception of articles in which the circulation department is concerned.

The town council of Luton have appointed Mr. T. Ridyard Roscoe, C.E., assistant surveyor, Islington Vestry, N., as engineer and surveyor for the Borough of Luton.

The dedication services of a church building which has been erected in Lower Broughton-road, in connection with the Salford New Church Society, took place on Friday. The church has been built from the plans of Mr. Thomas Browne, of Manchester. It is of Gothic design; the material is red brick with stone facings, and the fittings are of pitch pine. The total cost was about £5,300.

The heavy ring of six—tenor 39cwt.—is now undergoing restoration at Wrington, Somerset, by the firm of James Barwell, Birmingham. This firm have also recently restored and augmented the ring at Betley, Staffordshire, have supplied a set of Westminster quarters (hour bell 11cwt.) to a church in Ayrshire, and a bell of 12cwt. to the mission church at Peshawar (India).

The first contract for the construction of works has been let by the Lancashire, Derbyshire, and East Coast Railway Company to Messrs. S. Pearson and Son, the contractors for the Blackwall Tunnel. The present contract comprises ten miles of the main line from Chesterfield to Langwith, and several miles of branch lines. This length includes the heaviest works of the central section from Chesterfield to Lincoln. It includes three viaducts and two tunnels, one of the latter being about two miles long. Mr. R. Elliott Cooper is the engineer.

Our Office Table.

Complaints have frequently been made by contractors of the variations in practice of the London County Council with regard to their treatment of deposits of money made by those applying for specifications and drawings of an advertised work. In some cases, the money deposited has been returned to persons who subsequently sent in *bonâ fide* tenders, but in certain instances of large works, in connection with which great expense has been incurred in the preparation of drawings, it has been the practice of the engineer's department to retain the amounts deposited. These variations in practice, it is satisfactory to state, will now cease, as, on Tuesday, acting on the recommendation of the General Purposes Committee, the County Council made a standing order that, in all cases, money so deposited will be returned to persons who send in *bonâ fide* tenders.

Mr. Thomas Morgan, F.S.A., died on the 13th inst., at his residence, Hillside House, Streatham, Surrey, at the age of 72. For a considerable time he was a vice-president of the British Archæological Association, and for fifteen years was their honorary treasurer. During his connection with the association he contributed many papers, chiefly relating to his favourite subject, Roman archæology. In 1886 he published a standard work on "Romano-British Mosaic Pavements," which contained a history of their discovery, and a record and interpretation of their designs. Up to a few days before his death he was busily engaged completing another work on a kindred subject.

The death is announced, at the age of 76, of M. Carl Louis Muller, the distinguished historical and *genre* painter. He studied at the Ecole des Beaux Arts in Paris. He made his *début* at the Salon of 1834 with "The Promenade." This was succeeded by "Entry of Christ into Jerusalem," "Haydée," "Lady Macbeth," "Marie Antoinette in the Conciergerie," "Proscription of Young Irishmen," "Play," and "A Mass under the Terror." His most important work, "The Appeal of the Last Victims of the Terror," painted in 1850, is now in the Louvre. To M. Muller were intrusted the decoration of the Salle des Etats in the Louvre, and the paintings in the cupola of the Pavillon Denon in the same palace. In 1850 he was appointed to direct the artistic school of the Gobelins. In 1864 he was elected a member of the Institute of France.

The first meeting of the Applied Art Section of the Society of Arts for the present session will be held on Tuesday evening next, when Mr. William Morris will read a paper on "The Woodcuts of Gothic Books," illustrated by lantern slides, and on February 23 Mr. J. William Tonks will read a paper on the "Artistic Treatment of Jewellery: Jewel and Address Caskets." At subsequent meetings, papers will be read by Mr. E. Roscoe Mullins on "The Decorative Uses of Sculpture" (March 29); by Mr. C. Purdon Clarke, C.I.E., on "English Brocades and Figured Silks" (April 12); and by Mr. George T. Robinson, F.S.A., on "Decorative Plaster Work" (May 17). This will be a continuation of a paper read by Mr. Robinson last session.

A conference of the Bristol, Cardiff, and Swansea district councils of the district councils of the National Registration of Qualified Plumbers was held at Cardiff on Saturday. The report of the Bristol district showed that the council was formed on October 21, 1889. There had been 130 applications, and the total number at present registered was 109—60 masters and 49 journeymen. The percentage of passes since the examinations were established was 40. Similarly satisfactory reports were presented from Swansea and Cardiff. Mr. J. Wertheimer, B.A., Bristol, introduced the question of the education of plumbers, and a resolution was passed to the effect that the conference was of opinion that the technical education of plumbers was a question of national importance, the provision of which was exceedingly difficult and costly, and that it was expedient that its special claims for money help should be brought before the attention of the county councils.

The death is announced of Mr. James Colville, a well-known Edinburgh builder, residing at 16, Kemp-place. The deceased had a long connection with the building trade in Edinburgh, and took an active part in an agitation by the masons for increased pay more than 30 years ago. At that time (1861) a number of masons joined together and started the Edinburgh Co-operative Building Company, Limited, when Mr. Colville was apointed manager. From that time until about two and a half years ago, when he retired owing to ill-health, he held that post. During the time he was manager upwards of 1,500 houses for the working classes and others, at prices ranging from £130 to £450, were erected in Edinburgh and Leith by the Association, besides a large number of villas and shops.

The vestry of St. Pancras, London, have appointed Mr. W. N. Blair, Assoc.M.Inst.C.E., at present borough surveyor of Bootle, to the post of chief surveyor to their vestry, at a salary of £600 per annum. There were originally 73 candidates for the position, and from these the Highways and Works Committee selected 22 for personal interview, after which they recommended for the consideration of the full vestry the following six, in the order of selection as under:—Mr. W. N. Blair, borough surveyor, Bootle; Mr. J. P. Norrington, vestry surveyor, Fulham; Mr. W. Howard-Smith, city surveyor, Carlisle; Mr. J. P. Barber, vestry surveyor, Islington; Mr. G. J. Broom, borough surveyor, St. Helens; Mr. H. Monson, vestry surveyor, St. James's, Westminster. These gentleman accordingly had an interview with the full vestry, who proceeded to select two of the number for final consideration, these two being Messrs. Blair and Howard-Smith. After a discussion lasting some hours, a ballot was taken, when Mr. Blair was found to have received the greater number of votes, and was accordingly appointed.

The spring season will soon be here, and its precursors, in the form of fashion books, are already calling for attention. Among such publications as these we have to briefly note a comprehensive pattern folio of wallpapers manufactured for popular uses by Messrs. Cotterell Bros., of Bristol, who deserve credit for the variety of their designs, which are contrived to meet a great variety of tastes, and accommodate, in the matter of price, all kinds of customers. We may mention some good patterns prepared in sanitary papers, such as the Persian ornament in No. 39238, made in salmon-red and quiet greens. The "Girton," in glazed creams, with a silk-like finish, is bold and quiet, and the mica lustre in a darker red, called the "Lucerne," is suitable for small rooms facing the north, where brightness is wanted. Among the bolder designs, "Acanthus" is the best, though the flowers are lumpy, and the mosaic papers for dadoes and bathrooms are an improvement on the old tile patterns.

The thirty-eighth annual report of the Department of Science and Art states that the number of science schools decreased 132 during the past year, but in the number of classes in different branches of science there was an increase of 281, and in the number of pupils under instruction of 2508. Of the 86,318 students who were examined, but 71,417 were successful in passing in one or more subjects, whereas in the previous year 75,816 were successful. The payments on results to science schools, exclusive of those made to training colleges, for the year 1890 amounted altogether to £103,453 12s. 9d., or £656 2s. 5d. more than in the preceding year. The grants for drawing during the year 1889 amounted to £54,011 6s. 11d., in 1890 to £70,035 12s. 2d. The effect of the code in making drawing compulsory had been to raise the number of schools taking drawing from 1,324 to 9,500 at the end of April last. The total area dealt with by the Geological Survey during the year amounts to 725½ square miles, with 4,502¼ linear miles of boundary, being a large increase over the amount reported for the previous year. The expenditure of the Department during the financial year 1890-91 amounted to £473,102.

* * *

At a vestry meeting held at Chertsey, Surrey, last week, a committee was nominated for the restoration of the parish church, which, it was stated, was greatly in need of structural repairs.

Messrs. Hudson and Kearns have sent us one of their handsome, framed illuminated calendars, and a few of their office "tear-off" calendars, which are exceedingly handy and useful. The little ivory memoranda-tablet almanac and pocket book-knife they issue are also extremely well finished and desirable.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. President's Address to Students. 8 p.m.
Royal Academy. "Saracenic Architecture," No. 1, by Professor Geo. Aitchison, A.R.A, 8 p.m.
Society of Arts. Cantor Lecture, No. 1, "Development of Electrical Distribution," by Professor George Forbes, F.R.S. 8 p.m.
Liverpool Architectural Society. "The Rise of Civilisation in Babylonia," No. 3, by the Rev. F. F. Grensted. 6.30 p.m.

Tuesday.—Society of Architects. "Building Stones, their Structure and Origin," by Professor J. Logan Lobley, F.G.S. St. James's Hall, Piccadilly. 8 p.m.
Society of Arts. "The Woodcuts of Gothic Books," by W. Morris, M.A. 8 p.m.
Institution of Civil Engineers. 8 p.m.
Glasgow Architectural Association. "Approximate Estimating," by Jas. Lindsay. 8 p.m.

Wednesday.—Society of Arts. "The Scientific Value of Lovibond's Tintometer," by F. W. Edridge Green. M.D. 8 p.m.
Carpenters' Hall Free Lectures, No. 2. "Building Acts and By-laws for various Localities," by P. Gordon Smith. 8 p.m.
St. Paul's Ecclesiological Society. "Religious Subjects on Misericordes," by T. A. Martin. 7.30 p.m.

Thursday.—Royal Academy. "Saracenic Architecture," No. 2, by Professor Geo. Aitchison, A.R.A. 8 p.m.

Friday.—Architectural Association. "Fashions in Architecture and its Kindred Arts," by N. H. J. Westlake. 7.30 p.m.

* * *

Architectural Association, 9, Conduit-street, W.—February 29th, the Sixth Ordinary General Meeting, at 7.30 p.m. Paper by N. H. J. Westlake, Esq., on "Fashions in Architecture and its Kindred Arts."

Ernest S. Gale
F. T. W. Goldsmith } Hon. Secs.

CHIPS.

A joint committee of the county councils of Lanark and Renfrew have adopted plans by Mr. W. R. Copland, C.E., of West Regent-street, Glasgow, for the construction of a railway-bridge over the river White Cart at Eaglesham.

The Kidderminster highway board have agreed to advertise for tenders for widening the Habberley Valley-road, in accordance with plans by their surveyor, Mr. Shepherd, to whom they voted an extra sum of £50 for their preparation.

We regret to hear that among the architects who are suffering from the prevailing epidemic are Professor Aitchison, Mr. E. Ingress Bell, and Mr. T. E. Collcutt. Mr. H. W. Primrose, C.S.I., the secretary to the First Commissioner of Works, is also prostrated by influenza.

The London and North-Western Railway Company intends considerably augmenting the importance of Rugby as a centre of its railway system. On several acres of land recently bought, they are erecting new engine-sheds, repairing shops, &c., which, when completed, will give employment to upwards of 1,000 additional hands, the majority of whom will be drafted from Crewe and Wolverton.

A new church, to be dedicated to St. Peter, is about to be built facing the river at Staines, at the sole cost of Sir Edward and Lady Clarke. Mr. G. H. Fellowes-Pyrnne, of Queen Anne's Gate, S.W., has been appointed architect, and the work, which will cost about £5,000, is to be proceeded with at once.

Several contracts have been let in connection with the construction of the Glasgow Subway. This new underground railway, which is to be worked either by electric or cable power, will entirely incircle the western half of the city, and have its principal station in St. Enoch-square. The work of tunnelling, mostly through rock, from St. George's Church in Buchanan-street to St. George's Cross, will be undertaken by Messrs. Robert M'Alpine and Co., and the contract for the work from Coburg-street to Shields-road, on the south side of the river, has been let to Messrs. John Paterson and Sons, the tunnelling in this case being through soft material.

The Liverpool Architectural Society have organised a series of classes for students, to be given free of charge on Thursday evenings. They commenced last night, the 21st inst, when Dr. D. Harrison delivered an address on "Sanitation from a Physiological Point of View," and will close on April 21st, the lecturers including Messrs. T. Harnett Harrison, F.R.I.B.A. (president of the society), J. Dod, W. H. Keef, E. Ware, H. L. Beckwith, F.S.I., and C. E. Deacon, F.R.I.B.A.

The new Public Library for Bermondsey was opened by the Right Hon. Sir John Lubbock, M.P., on Monday. It has been built from the designs of Mr. John Johnson, of Queen Victoria-street, E.C., and will be illustrated by us next week.

Trade News.

WAGES MOVEMENTS.

Bolton.—The members of the various branches of the building trades in Bolton and district have agreed upon a scheme of federation, and a meeting for the adoption of rules and other preliminary matters connected with this step was held at the Spinners' Hall, St. George's-road, Bolton, on Friday night. The objects of the federation as set forth in the rules are to maintain the rights of combination of labour by trades unionism, by mutually supporting any of the societies within the federation, if individually attacked by employers or body of employers, to promote conciliation in trade disputes, and to advance and elevate the cause of labour generally. The federation is to be of a mutual character, and no financial responsibilities will attach to any society other than the claims of its own members and the subscription for working the federation. Each trade belonging to the federation will be required to confine itself to its own branch of industry, and if a dispute takes place between any society and the employers, the other societies connected with the federation are not to interfere unless non-society men be brought in to take the place of men on dispute or other unfair means used to crush the society affected.

Edinburgh Joiners.—A meeting of the branches in the Edinburgh and Leith district of the Joiners' Associated and Amalgamated Societies was held on Friday night to consider the "report from the Conciliation Board." Some of the men are dissatisfied with the Board's recommendation as to the rate to be paid for overtime and "country" work. After a three hours' discussion, the report was sent back to the Board for reconsideration.

Youghal.—All the men employed in the brickyard owned by Messrs. Green and Co. have been dismissed by the local agent. The dispute arose out of the dismissal of the crew of a lighter engaged in carrying brick, and the consequent refusal of the brickyard employés to fill their places.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Armagh.—For the construction of a new pipe sewer 2ft. 6in. dia., and closing and filling in of existing sewer at Armagh court-house:—

Bright, W. H., Portadown	£565	6	0
McIlwaine, S., Lurgan	442	12	6
Collin, T., Armagh (accepted) ...	442	10	0

(County surveyor's estimate £450.)

For pointing and cementing outside of Armagh court-house:—

McIlwaine, S., Lurgan	£172	12	6
Farr, T., Armagh	166	10	0
Woods, J., Armagh	159	10	0

(County surveyor's estimate £175.)

Beckenham.—For private improvement works, Lucas-road, for the Beckenham local board. Mr. G. B. Carlton, C.E., surveyor:—

Woodham and Fry	£520	0	0
Iles, E. W., and Co.	506	0	0
Mayo, R.	436	0	0
Mid-Kent Building and Contracting Company	417	0	0
Mowlem, J., and Co.	395	0	0

Berkhamstead.—For the erection of a police-station, lock-up, and residence at Great Berkhamstead, for the Standing Joint Committee of the Quarter Sessions and the County Council for Herts. Mr. Urban Smith, C.E., architect. Quantities by Mr. A. Burr:—

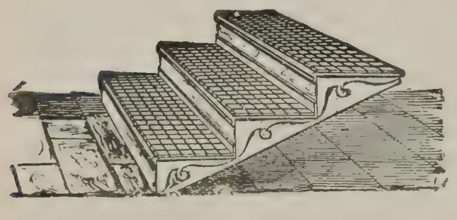
Chesterfield.—For the construction of section 1 of the Lancashire, Derbyshire, and East Coast Railway—viz., that from Chesterfield to Langwith. Mr. R. Elliott Cooper, engineer:—

Pearson, S., and Son (accepted).

HAWKSLEY'S PATENT TREADS.
Proprietor & Manufacturer: J. WESTWOOD, Jun.



NAPIER YARD, MILLWALL, E.
Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

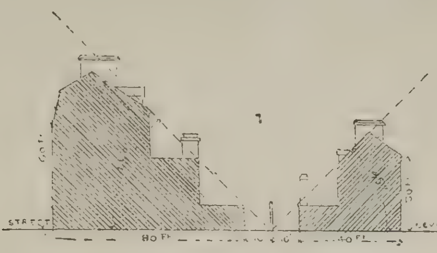
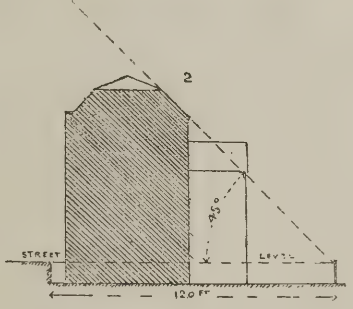
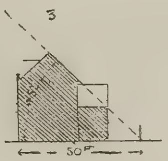
THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXII.—No. 1934.

FRIDAY, JANUARY 29, 1892

THE REGULATION OF BUILDING HEIGHTS AND SPACES.







THE absolute need of some rule to control buildings in the Metropolis must be obvious to everyone who has made any personal observation of the gradual encroachment on space by new erections and the rebuilding of old streets. Hitherto the only salutary check to such encroachment has been the law of light and air, or the domination of ancient lights, though these rights of property have often interfered with improvements of a public character. Litigation of a vexatious kind has been the chief deterrent to building additions; but in what manner? A building owner is allowed to proceed with his extensions or the addition of new stories till he receives notice of an injunction to restrain further building, or is compelled to pay heavy compensation to his neighbour for damages; in fact, the effect of the present law is to make money by enforcing compensation, or to promote legal proceedings, rather than to prevent the mischief which leads to them. And lawyers, and architects too, are easily found who will provoke rather than stay litigations. The other restrictions imposed by the Acts in force are too trivial and inadequate to meet the case. What practical advantage, for example, is gained by section 14 of the Metropolitan Management Amendment Act (now sec. 18) as to open spaces in the rear? That section regulates the space by the amount of frontage, and not in any way by the height of the building, so that the same space is provided for a building of two stories as for one of six or more; and not only so, but the space so provided in the rear may be built over to the level of the ceiling of the ground-floor story. We have all along objected to this system as quite inadequate, as a shop or offices on the ground floor might be extended to the very back wall of the plot.

The suggestion made by the Building Act Committee of the Consolidated Bill will alter this undesirable state of things. Space in the rear of buildings will be regulated by their height, and be left open, with the exception of conveniences like closets and receptacles for ashes, which are limited in height. Any rules to be at once rational and practical ought to be based on actual requirements. Of these there are two chief. One is: Given the depth of a plot of building land, to what height may the building be erected, and how much area may be covered? The other requirement is: Given the height of a new building, how much depth of space must be allowed? In one case we want to know to what height we can build; in the other case, what depth of building plot is necessary. These two requirements are solved by the rule adopted in Liverpool, to which we have already referred, which is to secure a free and open space of 20ft. between buildings in the rear, or 10ft. in depth for each building throughout the whole width of the building, and free from any erections. The remaining portion of the plot may be built on up to an oblique line drawn from the rear boundary at an angle of 45°, with another horizontal line at the level of the paving in front of the building, and no part of the building, except chimneys, dormers, gables, or other architectural features, is to extend above this oblique line. To make this rule clear, we give the following diagram (1), which is a reproduction of the one published by the committee. The houses, back to back, show the statutory open space of 10ft. to each, and, as will be seen, the oblique line will define the height of all back offices. The height of the larger house is 60ft., and the total depth of plot 90ft. On the other side is a house of half the height on a plot of 50ft. in depth, which will give an idea how the rule will work out for the modern class of dwellings. From this it will be seen that a house of from 15ft. to 20ft. frontage will have an open space free of all erection of from 150ft. to 200ft. at the very least. It is also seen that a plot of 50ft. deep will enable a house of 30ft. high to be erected, and as a matter of demonstration the least depth of ground for a house of this size will be 50ft., whereas under the existing section 14 of the Metropolis Amendment Act it may be 10ft. or 12ft. less. Thus it is evident that the height of the building is regulated by the depth of plot, and *vice versâ*. In fact, the height of the building at the rear cannot exceed the depth of land. It will also be noticed that the height of the back wall of the building measured from the street level practically determines the least depth of land, the angular line of 45° subtending that height; and it follows from this, and from construction, that the deeper the building is from front to back the lower it must be. One practical result is that projecting offices at the back of a dwelling-house are limited in height by the angle, or they will entail a greater depth of land. Thus, in Fig. 1, the smaller house has this projection reduced in height by one story. Fig. 3 also shows the rule applied to a house of two stories, with back projection, which is kept low. Should such a rule be made law in the Metropolis, the result will be that these back buildings will be curtailed in projection as well as height.

In our diagram 2 we show the application of the same principle to large houses of 50ft., or more, depth, and of 60ft. in height, by which it will be seen that a minimum depth of land is required of 120ft. The building is shown to be erected on ground below the level of the street, a common circumstance in building on new estates where the roads are made up to a higher level, by which arrangement the usual excavation for basement is not required. It will be seen that in this case the angle of 45° is measured from the street-level line, not from the ground level, as a correspondent in a contemporary appears to assume, and that, in consequence, a house sunk one story below the street level, as in many cases, will have the advantage of an additional story, instead of one less, as assumed. On this ground, we are afraid there may be an objection urged to the rule. Builders and owners who wish for more accommodation than they can obtain on a plot of land of small depth will be inclined to sink their basement so as to obtain an additional story, which, if permitted, would be injurious to health of inmates. Another objection that may be urged is that projecting offices will be reduced in depth and height to bring them within the proposed statutory angle, and the house be rendered less healthful; but these tendencies are met by other by-laws, and the occupants on the whole are gainers. No doubt certain expedients will be tried, such as reducing the height of stories so as to bring the required accommodation within the limit; but we apprehend that these attempts will quickly defeat their own purpose, as most people like spacious and lofty rooms.

The proposed rule is intended, of course, to prevent overcrowding, and to determine the minimum space at the back of houses; it does not do more. The angle of 45° has the advantage of easy calculation, as the back wall is limited in height to the depth of land, and it has also been used for ancient lights. In the absence of a more liberal allowance for real space, we may accept it as the best proposed. What is the state of things now? Houses can be built back to back without a foot of open space, the back walls actually within 20ft. of each other, and the poor are of course the sufferers—those, unfortunately, who are the least able to spare light and air. If the rule is passed, the overcrowded slums of London will disappear; "model" dwellings and flat companies will be unable to build monster residences in flats and dwellings for the poor on sites upon which only two-storied tenements ought to be erected. At present the lower stories of many of our so-called "model" dwellings are, as stated, "unfit for human habitation," though the authorities possess no power to prevent their erection.

Of course, the rule will not be applicable to all sites without modification. Take, for example, a small corner plot abutting on two streets; it would be impossible to apply the angle to each side, therefore the committee propose that the Council may permit the erection of buildings not exceeding 15ft. in height upon a certain portion of the open, or 10ft., space, as they think fit. If two fronts are built, the inner corner of the area only will remain, and this will have to be of a sufficient area for the purpose of light and air. Irregular sites also will have to be dealt with by the Council, and a proposal is made that the 150sq.ft. must be provided in every case, and be ventilated by a passage communicating with a street or open space. A future rebuilding or enlargement of old buildings not complying with the Act will necessarily bring them under the operation of the rule to such an extent, at least, that such alterations or additions must not reduce the area they now have. We commend to the attention of our readers these proposals, as perhaps a discussion of the rule we have explained may be of service, and suggestions may be made before the proposed amendment is finally adopted in the new Bill.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

Chapter IV.—Execution of the Works.

WORKING DRAWINGS AND SPECIFICATION.

THE general design of the building having been decided on, the next step is, of course, for the architect to prepare the working drawings and specification. With regard to these, different men have different practices. With some it is the custom to write a very long specification, and to supply very few detail drawings. They describe—or try to describe—everything in words. Architectural features, however, are seldom capable of being so described with anything like accuracy. A few lines drawn on paper will define them better than long pages of writing, and clear definition, above all things, is what is wanted. Hence it is better, in most cases, to draw more and write less. A comparatively short specification, plainly stating the quality of materials to be provided in each trade, supplemented by an abundance of illustrations showing all the constructive and decorative features, will form the securest basis for the builder's contract.

BILLS OF QUANTITIES.

A builder, however, as we all know, cannot form anything like an exact estimate of cost by merely looking at the plans and specification. He must measure up the labour and materials from them, or have them measured up, and these measurements, when put together and brought into shape, constitute a "bill of quantities." In very small works, or where a tender is only asked for from one firm, a contractor will sometimes be willing to do this measuring for himself. In such a case, he naturally and properly charges for the time and trouble of it in the amount of his tender. But where several builders tender against each other, it is customary that the quantities should be supplied to them all, and that they should be paid for by the builder whose tender is accepted.

INVITING TENDERS.

There are several ways of doing this. One way is to ask for them by advertisement, to furnish a copy of the bills of quantities to all applicants, and then, when the tenders come in, to consider whether the firm which has sent in the lowest one is qualified to undertake the work. It may happen that the firm is a good one, and then all is so far well. But it may also happen that, though honest and well-intentioned, they have neither capital nor experience. Their tender, perhaps, is many hundreds of pounds below the next one. They know nothing of church building, and they think the work will pay them at their price. It is put into their hands: they go on for a time, finding endless difficulties, and causing endless delays because the class of building, and perhaps its magnitude also, are new to them. Now, they cannot get materials because they cannot pay for them, or they get the wrong sort of materials, which have to be rejected. This happens over and over again. Their work is bad, and has to be pulled down. They lose more and more money over it; at last they can go on no further. Then come bankruptcy proceedings, litigation, arbitration, further delay, and general unpleasantness. This is the great risk in open competition amongst builders.

To invite tenders from a selected list of six or eight capable and trustworthy contractors is a safer course. The principal danger here is that most of the men selected may at the time be fully occupied, and may not care just then for more work except at a high profit. If this should happen, as it easily may, either the tenders must be all declined, or the building will be needlessly costly. But if this and similar evils can be provided against, this mode of obtaining tenders is a very good one. In deciding on the men to be invited, however, there is a common error to be guarded against. It is true, as the last paragraph is meant to show, that there are objections to employing a very small builder. But it does not follow that it is best to go to the other extreme, and invite the largest firms in the business. A very large builder is good for a very large building. Smaller places are hardly worth his while to give any great care and attention to. He will probably not bestow half as much time and thought to them as a competent man of medium position, who has credit to gain by doing them well, and reputation to lose by doing them badly. And even in case of admitted errors, however ruinous to the building, he may even say, as the head of a large firm said some years ago in reference to palpable and very injurious mistakes in a large Nonconformist church in London, "We have made no money by the mistakes, consequently we decline to rectify them, and, if you like, you can take the matter to arbitration, and see if you can make us." Extremes meet; and between the very small builder who cannot do his work properly, and the very large builder who will not do it, there is not a great deal to choose.

There is a third mode of obtaining tenders, which has some advantage over the other two. This is simply to advertise that contractors wishing to tender are to send their names to the architect. With the concurrence of the committee a selection is then made from these names, of firms whose character, experience, and position prove them capable of doing the work properly. To these selected firms alone the bills of quantities are sent, and in this way unsuitable persons are excluded. The advantage of this plan over the last is that in all probability those who apply will be at the time desirous of obtaining work, and therefore ready to take it at a moderate profit. Whatever system is adopted, the committee should announce beforehand that they do not bind themselves to accept the lowest or any tender. It is customary to stipulate that the builder whose tender is accepted shall deposit a copy of his priced bills of quantities with the architect, and that all additions to, or deductions from, the design contracted for, shall be measured and valued at these prices. If, therefore, when tenders come in, the building should prove somewhat more costly than was expected, reductions and alterations can easily be made, and their value ascertained in a way which is fair both to the contractor and the contractees.

The ordinary course is for the sealed tenders to be opened, and the amounts read out in presence of the contractors tendering, or of their representatives. If the first of our three modes of obtaining tenders has been adopted, now is the time for making a very close inquiry into the character and capabilities of the firm whose tender may be lowest; but if the second or third mode has been followed, all necessary inquiry, it may be assumed, has been already made. On either of these two latter systems, therefore, the work will naturally fall to the builder whose tender is lowest, provided that the amount of this tender is not excessive.

CONDITIONS OF CONTRACT.

When it has been decided what tender to accept, the next step is the signing of the contract. Building contracts usually contain a large number of conditions, which experience has shown to be necessary in order to prevent disputes, delays, overcharges, bad workmanship, and other evils. There are, for instance, a clause providing that deviation may be made from the plans without annulling the contract; a clause empowering the contractees to remove all bad materials and work; another one enabling them in case of delay to employ another contractor to complete the building, and another making provision for the event of the contractor's bankruptcy. There are also clauses binding the contractor to make good defects in workmanship, and to allow the contractees reasonable facilities for getting such thing as warming, lighting, and decoration done by anyone whom they may appoint.

Then there are the conditions as to time, and as to payment. A date for completion is fixed, and the contractor undertakes to complete by this date, or, in default, to pay or allow to be deducted from any money due to him a certain sum per week for any period by which he may exceed the time allowed. But, on the other hand, it is usually agreed that the time shall be extended in case of bad weather, strikes, or any causes arising from the action of the contractees or their agents. With regard to payment of the contract sum, a common arrangement is to pay from time to time as the work goes on successive amounts equal to 80 per cent. of the contract value of the work done. Then at completion, the contractor receives half the balance which has been kept back, and the remainder a certain number of months after, provided that all defective work has been made good. It is specially stipulated that no money will be paid without the architect's certificate in writing that it is due.

To prevent unexpected claims for "extras" at the final settlement, it is well also to insert a proviso that no work shall be allowed for as extra unless it is ordered as such in writing by the secretary or some other duly authorised member of the committee. And it is usual also for the contract to name an arbitrator, to whom, in case of dispute, questions about payment are to be referred.

CLERK OF WORKS.

The contract having been signed, there comes a question about the employment of a clerk of works. In a small building, with a capable and trustworthy contractor, this is seldom necessary. On the other hand, with a builder inexperienced in church works, or with a previous training more or less of the "jerry" type, it is vitally necessary. In such a case, even if he tries to do well, he will not know how. He will, in fact, be learning a new business; for to produce a soundly-built church requires a very different sort of apprenticeship from that which enables a man to run up cheap shops or £40 houses. And the clerk of works must be a really good one, accustomed to first-rate work. Such a contractor he will have to direct at every turn; and the blind cannot lead the blind. Clerks of works differ as much as builders—perhaps more—and not one in ten, however trustworthy and well-meaning he may be, is really fit for such an appointment as that just indicated. Hence the necessity of the recognised principle that the clerk of works should be selected by the architect, though he is paid by the committee. The contract should always contain a clause limiting the powers of the clerk of works, and especially stating that he has no authority to permit departures from the contract, or to order extra works. His business is to see the contract carried out, and if any departure from it should ever seem desirable, to state the fact to the architect, so it may, if necessary, obtain the sanction of the committee.

---

* All rights reserved.

With a competent and conscientious builder the works will in all probability go on smoothly. With an incompetent builder there will be frequent rejections of materials and workmanship, and much delay in consequence. No care on the part of the architect or the contractors will in such a case prevent the continual loss of valuable time, and if the matter culminates in the contractor's bankruptcy, there will be further loss of time and further trouble. As a reserve has been kept in hand the building may even then be completed for the contract sum, but the circumstances connected with its erection will never be pleasant to reflect upon.

FINAL ACCOUNTS.

When the work is completed the accounts will have to be finally made up. If there have been no deviations from the contract, or only a few trifling ones, this will be a simple matter, unless, indeed, the builder has been one of those (not quite unknown) who take contracts at a very low price, and then make all kinds of baseless claims at the end. No matter how stringent may be the conditions of contract, no matter how complete may be the original plans and specifications, no matter how unremitting may be the architect's supervision and the attention of the clerk of works, no building will be carried out as satisfactorily by a bad builder as by a good one. The material structure, indeed, may be at last made sound; but the loss of time in doing this, and the disputes which are likely to go on from the beginning of the scheme down to the final payment, are reasons for great caution in the first acceptance of a tender.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening. The President, Mr. J. MacVicar Anderson, was warmly congratulated on his recovery from a severe attack of influenza. The deaths were announced of Mr. Alfred Porter, of Bermondsey, Fellow, and of Mr. Henri Cornelius Elworthy, of London-road, St. Leonard's-on-Sea, Associate (son and partner of Mr. Thomas Elworthy, F.R.I.B.A.) The announcement that the council had decided to give a donation of £300 to the Architectural Association, in furtherance of their new scheme of education, was received with applause. The gift is to be paid by three equal instalments, the second and third to be conditional on the existence, at the time they become due, of the scheme.

THE ART OF PLANNING.

The PRESIDENT delivered his annual address to the students. If, he remarked, it be true that one of the chief difficulties that attend the study of architecture is to be found in the number and variety of subjects with which it is essential to be more or less familiar, it is no less true that the comprehensive nature of the pursuit constitutes one of its greatest attractions, for it opens up a field of inquiry over which the mind may roam with ever-increasing vigour and interest. No amount of devotion to a study so varied as that of architecture should conduce to lassitude, for mental refreshment is to be found—not in cessation—but in variety of thought, and the student of architecture need never experience difficulty in finding mental repose by turning from one to another of the many fields of research that lie before him. For the successful pursuit of a study so varied and so fascinating many qualifications are desirable, but three are essential: natural aptitude, application, imagination. Without the first, the student will do well to abandon the career, even though he may have spent time in discovering his want of affinity with it. If the heart, as well as the intellect, is not engaged in the work of life, you may possibly, in favouring circumstances, attain to respectable mediocrity, but you will never achieve real success. Be sure, therefore, at the outset, that you possess that earnestness of purpose and heart-love for your work which spring from natural affinity, and cannot exist without it. It is needless to insist on the importance of application. Original genius or natural endowments cannot be acquired or imparted; but it is marvellous to what an extent application compensates for the lack of such gifts. If you have application, you possess one of the most powerful levers with which to remove and triumph over difficulties. But it is obvious that natural aptitude and application, invaluable as they are, are not sufficient to qualify you for the career on which you are entering. Far away the most important work of your lives as architects will be that of design, and if you are devoid of the mental endowment of imagination—by means of which alone can there be design—you will be like a ship without compass or rudder, your lives will be aimless, and you will miss the prize of your calling. Possessed of all knowledge, your works, without imagination, will be but imitations and reproductions, not designs. Equipped with learning, but devoid of creative power, you would not be artists, and, therefore, could not be architects. I propose to confine my remarks to one branch only of your engagements as architects, that being "the art of planning." No doubt there are those who will regard such a designation as a contradiction in terms, for it is to be feared that there are not a few who consider planning as, at the best, a very prosaic part of an architect's work, and to whose poetic fancies the idea of elevating it to the dignity of an art may appear to be a sort of architectural blasphemy. There are others who, without going so far as this, do not hesitate to relegate planning to an inferior and subordinate place, not worthy of the exercise of the higher and artistic faculties of the designer—a constructive skeleton, as it were, admirable it may be in its mechanism, but which the architect must clothe with grace before it can be admitted to the sacred courts of art. Such views of planning are thoroughly fallacious, and injurious to the best interests of architecture, because derogating to a commonplace utilitarianism what is really an integral and inseparable part of the art, the root from which grow the loftiest conceptions, the suggestive source from which springs all that follows. Thus viewed, it is impossible to exaggerate or overestimate the importance of the study of planning. It may indeed be safely asserted that there is no study in which the human mind can engage, on the results of which the comfort, convenience, and happiness of society so much depend. This is claiming a good deal, but no more than the study demands. It is not my purpose at present to emphasise utilitarianism, but do not forget that every building is designed for use; to say so is not to derogate from art, because the highest art is displayed when a building is so designed as most successfully to fulfil its purpose by combining fitness with beauty. Thus the primary field for the exhibition of the architect's art is planning. Let me demonstrate it. What is architecture? Is it the mere clothing of the structure?—or is it the artistic design of the structure itself? Unquestionably the latter; and if so, how can the study of planning be other than artistic work, the primary stirring of the dry bones out of chaos, and the life inspiration which creates out of them the useful and the beautiful? for planning is not the mere casual throwing together of so many forms; the chance disposition of so many lines representing walls, inclosing so many haphazard spaces representing rooms. It involves the exercise of imagination. The design of the plan is the medium for educing this quality, just as much as the design of the elevation. It is customary to hear the word design applied to the latter much more than to the former, but the one is really just as much design as the other; consequently, the plan affords the opportunity for the display of artistic power just as much as the elevation. Not only so, but a true artist, while studying and elaborating his plan, has a mental drawing-board by his side, on which he rears in his mind's eye forms and proportions suggested by it and emanating from it; he disposes the arrangement so as not only to meet the requirements, but also so as to produce a happy result in point of effect; in short, the two things go together, they are mentally indivisible, and must be elaborated, not without reference to one another, but in unity. Hence experience demonstrates that a good plan will generally be found to produce a good elevation; they are integral parts of a whole; the one having been artistically studied with a view to the other, the result will be harmonious; if the tree is good, so will the fruit be. Did time permit, it might be interesting to divide the subject, and classify it under separate heads, treating each in turn, as, for example, the plan ecclesiastical, the plan collegiate, the plan palatial, the plan municipal, the plan judicial, the plan official, and the plan domestic; and we could easily find in the elaboration of the characteristics and requirements of each much that might profitably engage our attention. I must, however, content myself with a more general treatment, touching briefly on principles, leaving the application of them to your own imagination. None but those who have made a real study of planning have any conception of the infinite breadth and variety of the field of design which it creates; they only know experimentally the charm of puzzling over difficulties; of revising, rearranging, and redisposing, in order to overcome them; thereby probably creating other difficulties which in their turn have to be surmounted by a further similar process, and so on, until, after many disappointments, many failures, and many inventions, a satisfactory result is at length reached. It is now many years since I resolved never to let a plan leave my hands until I felt satisfied that it was right; and in battling with the difficulties thereby created until they have been successfully obviated, I have found some of the most engaging studies of professional life. The question with you should never be whether a plan is good enough—that is an unworthy standard—but rather, Is it the best that I can design? The former, the "it-will-do-well-enough," standard prevails far too commonly; the latter is the only standard really worth working for, because the only one which will lead to attainments beyond mediocrity. Never, then, rest content with a plan until you are satisfied that it meets and fulfils all the requirements of the case in the best and most complete manner that you can think of; the plan is the foundation of the whole design, and if the foundation is faulty, there is not much hope for the superstructure. It may seem like insisting on an elementary truism to say that the plan of a building must necessarily be adapted to, and governed by, the exigencies of the site; but the not infrequent violation, or rather neglect, of so obvious a principle justifies me in emphasising its importance. The peculiarities of a site in respect to levels and aspect frequently constitute difficulties that at first sight appear insurmountable; but out of which emanate in skilful hands the happiest results, which otherwise might not have been thought of, or attained. Herein is displayed the skill of the artist, to lay hold on all such adventitious circumstances and hindrances, and conform them to his will, translating obstacles into mediums for achieving success. The neglect of such opportunities is unpardonable, and betrays the bungler. Prospect, again, constitutes an important factor in planning. Few conditions call for more ingenuity than when the proper aspect is at variance with the prospect that it is desirable to secure. In towns, indeed, aspect and prospect must necessarily, and to a great extent, be subordinated to immovable conditions, but in the country it is different. While, therefore, striving for comfort, convenience, and grace within, never neglect an opportunity of securing the inestimable attraction of a higher than any art loveliness, the prospect of nature and creation. In connection with prospect let me in passing condemn a practice too much in vogue, the glazing of the upper portions of windows with tinted, stained, or painted glass, sometimes uglier than anything it is intended to obscure from view. Situated as we are in London, the expedient is no doubt attended with advantages, shutting out hideous objects which one's neighbours are so fond of obtruding, or excluding the impertinent gaze of the too curious; but in the country, where it is frequently adopted, what possible justification can be urged? Is it possible that anything can compensate for the light of the sun, the beauties of nature, or the marvels of the heavens? Never, then, attempt to obscure the contemplation of God's universe by the commonplaces of humanity. Further, a plan to be good must be simple. The arrangement of some buildings is necessarily more elaborate than that of others, but you may take it as an unerring guide that when you find a plan becoming complicated and confused you are on the wrong tack. I have seen an artist, after hours of work, wipe from his canvas all he had painted, and then make a fresh start with manifest advantage and no real loss of time; so when your planning results in complication, your best course is ruthlessly to obliterate what you have done, and begin *de novo.* Nothing will compensate for the absence of simplicity in a plan. This is a golden test which I have never hesitated to apply, and I speak from no inconsiderable experience. Again, a plan is only good when it is the embodiment of thrift. Much has been said, and more has been written, on the moral aspect of thrift, and it would be easy to enlarge on the advantages of its application, not merely to the life, but also to the artistic work of the student of architecture. Without thrift, both of space and material, a plan cannot properly fulfil its purpose. Thrift is not parsimony, any more than liberality is waste. Each space in a plan, be it room, hall, stair, or passage, should be just the size that is necessary for its purpose; if it be less, there is parsimony, for what is inadequate will have to be enlarged hereafter at much more than what would have been the original cost; if it be more, there is waste, for it has involved the expenditure of more capital than was required, and will incur needless labour and consequent cost in maintenance. Take, as an illustration, a room which has been designed on a scale beyond the necessities of its occupants. It is obvious that it has cost more to build and furnish than it should have done, and involves a perpetual cost for maintenance and service which should have been avoided; hence the happy medium is to be found in thrift. So in respect to materials; walls should be of sufficient thickness, floors and roofs of sufficient strength, for their respective functions, not much more, and not much less; else there will ensue, either waste in the first instance, or parsimony, which will involve waste in the long run. There are, however, cases in which materials should not be too sparingly employed; in a mansion, for example, intended to be a family home, and to pass from generation to generation, it would be unwise, and out of keeping with its purpose, to apply too literally such a condition as this; for nothing imparts more dignity and a greater idea of the enduring purpose for which such an edifice is designed than massive walls, thicker no doubt than may be actually required for sound construction, but not more than is called for in order to be in harmony with the traditions and associations that the structure will represent. This, however, is but one of those exceptions that prove the rule of thrift. I am not unprepared for the inevitable protest of the art-student, who in a burst of æsthetic enthusiasm will denounce the suggestion that so prosaic a quality as thrift should dare to enter the hallowed sanctuary of the art studio; but it would be in the true interest of art were her portals more frequently and more hospitably thrown open for the admission and entertainment of the prosaic maiden I have introduced to your notice. How often, for instance, might she, with manifest advantage, restrain the artist hand in scattering with inartistic profusion ornament which is misplaced and therefore ineffective! There are various conditions, more or less obvious, each one of which contributes in its place to the merit of a plan. Apart from considerations of aspect, prospect, and dimensions, each place should be, not only convenient in itself, but should be in its proper position in relation to other places; the work of an establishment, as well as the cost, may be materially diminished or increased, according as this condition is observed or neglected; doors, windows, fireplaces should be arranged so as at once to promote comfort and convenience without needlessly destroying wall-space, or incurring draughts; the amount of window-space should be regulated according to the aspect; in short, the perfect plan is, and can only be, the result of the thoughtful study of each principle and every detail. None are too minute to be overlooked. As little things sweeten life, so attention to little details makes a plan complete. I have written to little purpose if I have not convinced you that planning is one of the most important, difficult, and artistic studies of the architect. Now let me inquire why it is that plans are so frequently bad. I am aware that there are men in the profession who are adepts in planning, and whose productions in this respect we admire. But are they the majority? Rather will they be found to be the small minority. Rarely do I examine published plans without detecting faults which are obviously not the necessary outcome of the circumstances. Why is this? In the majority of cases it does not arise from lack of ability on the part of the author, but from the neglect to apply the ability he possesses to the working out of a good plan. Where plans are bad, they are so from two causes. 1. It is impossible to produce a satisfactory result without practical knowledge of the requirements; in the case of a gentleman's house, for example, how can we expect to succeed without being familiar with the nature and working of the establishment? 2. Plans are bad because they are not studied as they should be; there are many practising architects who have never realised the true nobility of planning, who have never experienced the fascination of the almost exhaustless field it presents for the display of imaginative artistic skill, and who consequently have concentrated their artistic powers in the design of the elevation. Need I guard myself from possible misconception by adding that not one word I have written is intended to militate against the importance of artistic design as applied to the elevation? My subject is planning, and my remarks naturally apply specially to it. Moreover, architects are not likely to regard the design of the elevation as the least artistic portion of their work, and it is because I entertain the conviction, judging from results, that they do far too much regard the design of the plan in that light that I have emphasised its artistic character. The architecture of the future will derive its character, and find its development, from the students of to-day; hence I have embraced this opportunity to bring specially before you the subject of planning, believing that those who undervalue it do so because they have not studied it and tasted its fascination, and in the conviction that there is no more useful as well as artistic study in which you can engage. The subject vitally affects you who are devoting your lives to the study of architecture, and your treatment of it will still more vitally affect those for whom, by-and-by, you will be called on to design; nothing will so certainly secure for you their grateful blessing as to promote the comfort, convenience, and beauty of their homes, for on nothing does the daily happiness of civilised society so greatly depend. If I have succeeded in elevating the study and lifting it out of the prosaic level from which it is too generally regarded; if I have inspired in any of you the determination to throw yourselves into it with an enthusiasm which you may not hitherto have displayed; if I have thus, through influencing you, sowed seed which will fructify for the benefit of succeeding generations; if I have demonstrated that in this study is to be found one of the most interesting, fascinating, and artistic pursuits, the time will not have been misspent which we have this evening devoted to the consideration of the art of planning.

Mr. Aston Webb, hon. sec., read an elaborate criticism on the drawings and designs submitted for the various medals and prizes. The competition could be, he said, divided into three classes: sketches of old work, designs for ideal buildings, and essays. The work done in the first class, to which the Institute Silver Medal and Pugin Studentship belonged, were either of the greatest use to a student in after life or practically worthless, according to the mode of sketching adopted. It might be taken for granted that if the sketches were of general interest they would be of little real value to the student. It was far better for him to measure up a portion of a small church, giving a plan, section, and many dimensions, than to cull pretty bits from many sources. A sketch, for example, of a nave arcade would be practically valueless if not accompanied by a plan and section, however rough, to show the relation to the building, and, above all, the dimensions should be freely introduced. The late Mr. G. E. Street almost always gave a few leading dimensions in his sketches. Having criticised in detail the designs submitted for the Pugin Studentship and the Institute Silver Medal, Mr. Webb referred to the second class of competitions, remarking that the power to design was never developed so early as that of draughtsmanship. This year more than one competitor relinquished the task of competing for the Soane Medallion, although it was now augmented to £100, and was the most valuable prize in the gift of the Institute. The subject, a chapter-house, was not an easy one, and of the eight who sent in designs, four adopted an octagonal, three a sexagonal, and only one a parallelogrammetric plan. The prize had been taken by a Late Decorated octagonal design, while a sexagonal plan, treated in Late French style, was placed second, and given an extra medal of merit. The essays had, he was sorry to see, sunk to too much of a catalogue of the accompanying drawings bound with them, whereas the prize was intended to develop literary power and ability. As a whole, he thought the the Institute might be proud of the work submitted in the competitions. Those who had failed to succeed would probably be the first to acknowledge that they had derived much benefit by the work done. In a short time the competing students would be at work in a more important sphere, and would be either encumbering or beautifying the world with the buildings they designed. If the promise of the draughtsmanship of to-day were fulfilled by the buildings of to-morrow, we might be very hopeful of the architecture that was yet to come.

Mr. John Slater moved a vote of thanks to the President for his address. This was seconded by Mr. Charles Barry, F.S.A., who suggested that among the subjects architects might usefully study was one omitted by the President—viz., the characters of their clients, individual and corporate. He could recommend young architects not to neglect that form of diversion.

The President, in replying, said he thought the study of the character of clients scarcely came within the scope of the art of planning. He wished to thank Mr. Webb for the careful, exhaustive, and admirable criticisms he had offered on the drawings—a task, the President added, he had purposed undertaking himself, but had been prevented by illness. He then distributed the prizes and medals in accordance with the list published by us last week on p. 122.

BUILDING STONES: THEIR STRUCTURE AND ORIGIN.[*]

In grouping building stones, it is found to be more practically useful to adopt a lithological rather than a geological or stratigraphical arrangement. A lithological arrangement of building stones must necessarily be based on mineralogical composition, and this will at once give convenient descriptive names for the seven groups or classes, which we shall find comprise all stones used for ordinary building purposes. These are: (1) sand stones, (2) lime stones, (3) argillaceous stones, (4) talcose stones, (5) felspathic stones, (6) hornblendic stones, and (7) augitic stones. Sandstones may be defined very simply and briefly as masses of sand, the grains of which are cemented together. They thus consist of grains of sand and a cementing material. To take first the grains of sand, we find that they are grains of the very hard and refractory mineral quartz, which is chemically silica, a simple compound of the two elements silicon and oxygen. This mineral, so abundant in nature, assumes various forms, and is known in some of these forms as rock crystal, flint, chalcedony, agate, amethyst, cairngorm, &c., and constitutes not only the sands of the deserts, the sands of the sea-shore, and the pebbles of shingle beaches, but also the delicate framework of many tropical sponges, and of microscopic marine creatures of arctic latitudes. It also constitutes the gravel of the Thames Valley, so familiar to all Londoners, and which is but worn-down fragments of flint from great and wide-spreading masses of chalk, which have been removed by denudation from the drainage area of the Thames. Quartz, being practically insoluble and of great hardness, endures when associated minerals are dissolved, decomposed, or reduced to impalpable dust, and thus the sand of which sandstones are formed has been derived either directly from quartzose igneous rocks, such as the granites, from the quartz veins of the older sedimentary rocks, from the flints contained in the chalk, or from the destruction of older sandstones and beds of sand. The grains therefore vary greatly, both in size and angularity, some sandstones being composed of grains both large and with sharp angles, while the grains of others, from long and repeated attrition by the action of moving water, are very small and devoid of angularity, their edges being all smoothly rounded; and there are all degrees between these two extremes. The cementing material varies considerably also, and does so both in character and amount. It is sometimes of the same mineral composition as the grains themselves—namely, silica; it is sometimes iron oxide; it is sometimes argillaceous matter, and sometimes carbonate of lime, and it is often a combination of two, if not of more, of these substances. When the cementing material is silica alone, the resulting sandstone is white, and may be very hard. When iron-oxide forms the cement, either in whole or in part, the stone is coloured red, brown, or yellow, and may be either a very soft or a very hard stone. In a red sandstone the grains themselves are only red at the surface, where they are coated with a thin film of the peroxide of iron, the reddish colour of which is so familiar to us in iron-rust. If, therefore, the iron-oxide of a piece of red sandstone were dissolved by acid, white or colourless grains of quartz would alone remain. It will be evident that the terms hard and soft as applied to a sandstone have no reference to the material of the grains of which it is composed, but only to the stone as a coherent mass, the grains of the softest sandstone being just as hard as those of the hardest, and that it is the character and amount of the cementing material that is the cause of the varying hardness of sandstones. Thus sandstones may, from lack of cementing material, be so soft as to be easily crumbled by the fingers, since they are little more than beds of sand compacted into coherent masses by pressure, such, for instance, as the very soft sandstone of the well-known "Rocks" of Tunbridge Wells, which, however, has harder bands where there is a sufficient amount of ferruginous matter to furnish an adequate cement. The unequal weathering consequent upon these harder bands produces such grotesque masses as the Toad Rock of Rusthall Common. Some of the finest British sandstones, hard, fine-grained, and white, are from the Coal Measures and Lower Carboniferous series, which furnish the excellent building stones of Bradford, Halifax, and other Yorkshire towns, as well as Newcastle-upon-Tyne, and the famous Craigleith and other white sandstones used in Edinburgh and Glasgow. The Trias yields the sandstones of Warwickshire, Cheshire, Lancashire, &c., and from the Permian of Westmoreland is quarried a fine-grained pink sandstone. The very coarse and hard sandstones called grits are not used except very locally as building stones, but they make excellent millstones, and one of the geological formations that has long been worked for them is called the Millstone Grit. Perhaps the hardest sandstone is found in those great and interesting blocks of stone lying on the surface, called Sarsen-stones, which our prehistoric ancestors used so freely as a convenient building material ready quarried and lying at hand for their mysterious circles, trilithons, dolmens, and cromlechs. The larger stones forming the outer circle of Stonehenge are Sarsen-stones, and so are all the stones of Avebury and Ashdown; the "Countless Stones" of Aylesford in Kent, Kit's Cotty House, and many other so-called Druidical remains. Sarsen-stones may therefore be regarded as the earliest used building-stones of this country, and they still lie in great numbers on the Wiltshire and Kentish Downs. Indeed, their abundance on the surface of these grassy uplands has suggested the name Grey Wethers, by which they are often called, from their resemblance at a distance to a flock of sheep. The origin of sandstones, whether coarse or fine, whether hard or soft, may be learnt from a visit to any sandy shore on our coasts. Sandstones are simply the consolidated accumulations of sand brought into the sea and there deposited, either from the denudation of inland areas or the destruction of sea-cliffs, rivers forming the transporting agent from the interior to the coast. The accumulated masses of sand, covered over by great thicknesses of other rocks, and elevated above the level of the sea by that imperceptible but long continued vertical upheaval which transforms sea-bottoms into dry land, is penetrated by water holding in solution the cementing material, or substances from which it may be derived, which is thereby carried to all parts of the mass, and is left as a solid agglutinating substance between the grains cementing them together. Sandstones have, therefore, been formed by the simple slow-acting mechanical forces of nature, supplemented by chemical operations, also continued through long periods of time. But in the case of Sarsen-stones it may be asked how is it that they are found as separated blocks lying on the surface of the ground, and above, not sandstone, but the limestone chalk? The answer given by geology is that they are the remnants of beds that were once above the chalk, and that, with the exception of these blocks, have been removed by denudation. The great blocks of stone now exposed were formed by limited portions of beds of sand being converted into stone by the cementation of the grains by silica, while the bulk of the bed remained loose sand, which yielded subsequently to the removing power of water, while these heavy blocks of solid stone were merely gradually lowered until they rested on the surface of a lower and an entirely different formation. Sandstones *in situ* may be either thick or thin bedded. Triassic sandstones are often very thick bedded, as at Grinsill, in Shropshire, and in the neighbourhood of Liverpool, on both sides of the Mersey. In Yorkshire, on the other hand, the Coal Measure sandstones are sometimes very thin bedded, in which case they are quarried for the flagstones over which we walk in London, and for other covering purposes. This stone often contains layers of fragments of mica, that cause the flags to split again, with wear and weathering, into still thinner slabs and plates. The divisional planes between the beds in a sandstone quarry are caused by a change of conditions having occurred at intervals during the period of original accumulation; the deposition of a little argillaceous matter being sufficient to separate arenaceous beds. Though their silicious material is not liable to decomposition by the atmosphere, sandstones may be much affected by weather removing the cementing material from exposed surfaces. Some years ago, previous to the restoration, Chester Cathedral presented a remarkable aspect. It was built of the deep red and soft sandstone of the district, and the angles of the blocks were so completely worn away that each block of stone stood out separately, presenting a smooth projecting convex surface, all carved work having quite disappeared. A harder and paler coloured stone has been employed for the restoration. The limestones form a more numerous and varied class of building stones than the sandstones, and much more interest attaches to their structure and origin, since both organic life and chemical action have taken part in their formation. Mineralogically a limestone consists essentially of calcite, a mineral that is chemically carbonate of lime, lime being a simple compound of the elements calcium and oxygen, and, therefore, a pure limestone is made up of three elements, calcium, carbon, and oxygen. While many limestones are approximately pure calcareous matter, some contain, disseminated throughout their mass, other substances in greater or less proportion. They also vary in hardness very greatly, for the soft white chalk, the easily cut Caen stone, the harder Portland stone, and the very hard Devonshire and Anglesea marbles, as well as all other marbles, are all equally limestones. Although the chalk is not now usually regarded as a building stone, yet its harder beds were quarried for building material in olden times, some of the most ancient churches of the South-East of England being partly constructed of the lower or grey chalk. Chalk is composed of minute, even microscopical, particles of carbonate of lime, simply compacted together by pressure. Hence its general softness and great absorbent power. The latter quality is so marked that a cubic foot of quite dry white chalk will hold a gallon of water before the super-saturation point is reached. The limestones, however, which are best known now as building-stones, such as Portland stone, Bath-stone, Box stone, Leckhampton or Cheltenham stone, Ham Hill stone, Barnack stone, Ancaster stone, &c., called comprehensively Oolites, possess a quite different structure, the result of other conditions and other agencies. The characteristic structure of oolite is the aggregation of small globular grains, and their cementation together so as to form a solid stone. From its resemblance to the roe of a fish this structure was called oolitic, from the Greek word *oön*, an egg, but in some cases the spherical grains are as large as peas, as in the Pea Grit of Leckhampton, when the structure is called pisolitic. The typical oolitic structure is best exhibited by Bath stone, which is from the Great Oolite, in which the round grains are very uniform in size, and form the whole stone. On being examined by the microscope the little globes are found to consist of an iron-like arrangement of concentric coats of carbonate of lime surrounding a central nucleus of a particle of shelly or sandy matter. Now it was found by Dana that the calcareous sand on the shores of some of the coral islands and reefs of the Pacific was of a similar character to the grains composing Bath oolite, as a consequence of minute particles of coral-rock being rolled in water highly charged with carbonate of lime, which has covered over these particles with successive coats of solid mineral matter. On the shores of the Great Salt Lake in North America, oolite is being formed, and the Sprudelstein of the springs of Carlsbad has a similar structure. Thus is explained the origin of Oolite rock, which was formed by an accumulation of coral-island calcareous sand, and its subsequent cementation into solid stone by the introduction of more carbonate of lime by water action. The structure and texture of oolitic limestone render it an easily worked free-stone, and well adapted for ornamental work in which carvings are conspicuous. Of the same geological age as the Bath stone, that of the Great Oolite, is also the Caen stone of Normandy, so admirably adapted for interior carved work, the Box, Doulting, and Corsham stones of the West of England, and the Ancaster stone of Lincolnshire. The Inferior Oolite stones, including Cheltenham or Leckhampton stone, Dundry stone, and Ham Hill stone, are less pronounced in the oolitic structure, though it is displayed in its extreme form in the pea grit of the Inferior Oolite. The Portland stone, so well-known as the chief building stone of London, the stone of St. Paul's and nearly all of the great public buildings of the Metropolis, is much harder, whiter, and less regularly oolitic in structure than either the Great Oolite or the Inferior Oolite stones. It also occasionally contains large shells in the building-stone beds. It is, therefore, perhaps better suited for non-Gothic than for Gothic buildings. It is an almost pure limestone. The compactness of the texture of Portland stone is indicated by the fact that it only absorbs 8·86 per cent. of its weight of water. Some of the beds of the Portland stone, as a geological formation, are so crowded with fossil shells and casts of shells, and contain also so many cavities from which shells have been dissolved away, that the stone from these beds is quite unsuited for ordinary building purposes. This stone, called Roach, is, however, highly interesting as being strikingly indicative of the marine origin of the Portland stone, for the shells, or casts of shells, it so abundantly contains are well represented in the present seas of the globe. Although Portland stone has been worked for centuries in the Isle of Portland, there are three enormous masses still available; while at Great Swindon in Wilts, and Stone and Brill in Bucks, there are also large quarries. Another oolitic stone, the Coral Rag, was much used at one time for building purposes at Oxford, near which city, at Headington, it is still worked. The explorations and careful and elaborate observations of Darwin, Dana, and L. and A. Agassiz amongst the coral islands and the coral reefs of the tropical seas conclusively show that limestone rock is now being formed on a great scale by the unwearied industry of the little coral animal.

[*] By Prof. J. Logan Lobley, F.G.S.; a paper read before the Society of Architects on Tuesday last, Jan. 26, 1892.

(*To be continued.*)

SARACENIC ARCHITECTURE.

PROFESSOR GEORGE AITCHISON, A.R.A., is delivering this session a course of six lectures to the Royal Academy students on successive Monday and Thursday evenings, the subject being "Saracenic Architecture." Numerous photographic and other illustrations are exhibited. In his opening address, given on Monday evening last, Mr. Aitchison pointed out that the architects of the Early Saracenic monuments were probably Byzantine. It appeared hopeless to endeavour to ascertain the nationality to which the architects belonged, who made the first advance forward towards an independent style, for polygamy then prevailed, and we know the names of but very few artists. It was even impossible to learn the character of the architecture that the Saracens brought with them. The original Saracens were of three sorts, firstly, the wandering tribes of herdsmen or nomads; secondly, those who lived in towns and tilled the land, as the people of Medina; and thirdly, those who were carriers and merchants, like the people of Mecca, and the first and last tribes equally despised each other and the husbandmen. The new religion of Mohammed for a time welded a set of hostile tribes into a nation, and sent them forth to conquer. It also caused the erection of mosques, probably the modification of the plans of other buildings, and of their ornaments. In little more than a century after the death of Mohammed his followers had not only conquered Persia, Khorasan, Afghanistan, Bokhara, Scind, and the Punjab from the Indus to the feet of the Himalayas, and had penetrated to Samarcand and Kasgar, but they had also subjugated Syria and Palestine, Egypt, and the North Coast of Africa to the Atlantic, the greater part of Spain, the south-east of France, and had ravaged Asia Minor and the main islands of the Mediterranean, and besieged Constantinople. The lecturer continued: Mohammed's immediate successors, the Caliphs Becker and Omar, imitated his frugality, simplicity of dress, and living. The third Caliph, Othman, of the Omeyza family, became enormously rich, built himself a palace at Medina, with marble columns and walls covered with costly stucco, and gave all the principal employments to his relatives. All the nobles of the Koreish and the governors of cities or countries built themselves palaces in many places. This caused a great scandal to the ascetic Moslems, just as splendid private buildings had scandalised the Romans of the Republic, and, of course, the poor were furious with envy. From this time forward there were constant riots, rebellions, and revolutions, and the old tribal feuds broke out again. After the first three caliphs the Caliphate became a vulgar despotism of the ordinary type, only with religious despotism superadded. Even in the first few years of the second Caliphate these half-starved barbarians, the Saracens, had obtained the main treasures of the Persian Empire and the rich plunder of Syria. Private troopers had got five or six hundred pounds apiece as their share in one expedition, equal to at least ten times that amount now, the imperial carpets of Persia, embroidered with gold and precious stones, were cut up and sold by auction at Medina. Great Arab settlements were at once made on the Tigris and Euphrates; Kufa and Mosul were built, and these, as well as all the other settlements, must have had mosques built. In some places, as at Damascus, the cathedral was divided between the Moslems and Christians. We know of the Mosque of Amru being built at Cairo, and Omar's Mosque at Jerusalem; but whether this was the Dome of the Rock or the Mosque of El Akbar, I must leave the learned to decide. These monuments were doubtless constructed with materials plundered from ancient edifices, and were designed by Byzantine, Syrian, Persian, or Koptic architects. If Byzantine architecture is chaotic as regards dates, what can be said of Saracenic architecture, of whose early work we know nothing, nor of the Persian, Indian, or Koptic architecture, from which, or from the Byzantine, all their new architecture must have been taken? Even before a conquered world lay at the feet of the Saracens, fierce conflicts were waged between the rival caliphs, and religious seditions were rife, and between the two everything was detroyed; the holy Medina—the scene of much of the prophet's life, inspirations, and preaching, and the site of his tomb—was given up to pillage by Yezid I.; horses were stabled in Mohammed's mosque; and the very Kaaba of Mecca was burnt down. In the first days of the Abassides, 132 A.H., the empire began to break up; Spain never acknowledged their sway, and all Africa, except Egypt, had to be re-conquered. And besides all the plundering, burning, and destruction in the days of the Omiades, and still greater destruction took place at the end of the Abasside dynasty, when the private disputes of Turks and Tartars were added to those about the religion, the predominance of tribes and rival dynastic claims after the Arabian caliphate was at an end and the rulers were mainly Turks. The part under their sway was like the East after Alexander the Great's death; the kingdoms were constantly being overrun and reconquered, and then there was the destruction by the Crusaders. Subsequently a fresh tide of destruction overwhelmed the greater part of Asia when Tamerlane and his savage hordes swept over it. Most probably, while the conquests were being made, Saracens, who were little better than banditti, loosely held together by a common faith and the love of bloodshed and plunder, were not very likely to settle down to study the fine arts, even if pure Arabs ever did; and this is, to some extent, borne out by the fact that Welid I. (705 to 715 A.D.—86 to 96 A.H.), although he built much and encouraged manufacture and design, accepted £60,000 in gold, several loads of mosaic, and one hundred Byzantine masons from Justinian II., Phillip Bardanes, or Anastasius II.; it is also said that in a treaty between him and the Byzantine Emperor the latter was to furnish the mosaic for his new mosque at Damascus. As late as Abd-al-Rahmân, the last of the Omiades, who became caliph of Spain, and reigned from 754—787 A.D.—138—171 A.H., architects and skilled workmen were sent him by the Byzantine Emperors to build the mosque at Cordova, and all the monarchs of Europe sent him columns plundered from ancient edifices for the same purpose. Ab-al-Rahman is said to have founded universities in Spain. Mamun, the son of a Persian princess, is said to have founded colleges and libraries, and to have commanded Mohammed Ben Musa to publish a book on quadratic equations, called Al Jebre al Mokabala (restoration and reduction), from which comes our word Algebra. The substance of the work appears to have been derived from Hindoo sources. Subsequently, the works of the Greek physicians, philosophers, arithmeticians, and geometers were translated, and physic and mathematics became favourite studies of the Saracens. The Abassides had great influence in Persia, Khorasan, Afghanistan, and Bokara—they were descended from El Abbas, the time-serving uncle of the prophet, and not like the Omiades, descended from his enemies; they seem, however, to have been less noble and less liberal, and even more bloodthirsty and perfidious than the Omiades, yet these reigns are held to be the golden age of the Caliphate; they introduced Turks for their fighting men, and Greeks and Persians for posts where intellect was wanted,—commonly called officers of the pen and of the sword. After their extinction, Turks mostly filled their places; the Arab race having lost their religious enthusiasm, fell generally into a lower grade. In some respects, the Moslem world, as far as architecture is concerned, was in much the same position as Europe is now,—it had become enormously wealthy, new buildings were made on an unprecedented scale, and the main architecture of the world lay before it for study; but there was no Saracenic style. The buildings were in the style of the country or town in which they were erected; or in the style used by architects who designed them. I say this, however, with some diffidence, for the mosque at Cordova, San Cristo de la Cruz at Toledo, and St. Maria de la Blanca are unlike anything else I know. The attractions of living styles are greater than we could imagine if we had not such frequent examples before our eyes. English architects of all degrees of excellence and talent go to our dependency, and whether they affect Classic, Gothic, Renaissance architecture here, they at once take up with the native style of that part of the country they inhabit, or paraphrase the Moslem buildings they find there; and it is the same in Egypt—the last hotel built by an English architect close to the Pyramids has its architecture borrowed from the mosques, even to the niche. It is admitted that the Saracens brought no style with them from Arabia, but adopted features that pleased them from the countries they conquered, the most characteristic feature being the minaret, and this is said to have been Persian; the dome was taken from the Byzantines, the niche (mehrab) from the apse of Christian churches, floral ornament that was not Byzantine probably from Afghanistan or India. Fergusson remarks on the similarity of the ornaments on the tomb of Mahmud of Ghuzni to those used in the mosque of Ahmed-Ibn-Tulun at Cairo, only this would suppose that it was not indigenous unless earlier examples could be found, for Ahmed-Ibn-Tulun died in 883 A.D., and Mahmud of Ghuzni was not born till 967 A.D. Architects in the "Arabian Nights" are always called mathematicians or geometers, and when they were thoroughly imbued with geometry they made great advances on the geometrical patterns of the Byzantines, on whose work it was based so as to completely transform them. A striking peculiarity of Saracen art is the stalactites. There is an ingenious and plausible theory that may turn out to be the true one—that the stalactites or honeycomb work sprang from the brick niches in the domes of steeples of the tombs of Ezekiel and Zobeide, Er-Rashid's head wife, both near Baghdad; these spires strongly remind us of jelly-moulds. If it came from these niches, the Moslems developed them to a degree that bears no resemblance to the original, for who would trace from this the stalactite domes of the Alhambra, which are certainly some of the most wonderful achievements of man; in fact they suggest the work of enchanters, or of things being sent down from another world; at first sight their maddening complexity, and their apparent want of support, makes it impossible for us to conceive that mere human beings could ever have invented or produced them; one would be led to believe that the Spanish ones were suggested to some genius by his seeing some pieces of wood of irregular length, whose ends had been shaped put together for mosaic-like Tunbridge ware, for every wood corbel or capital I examined in Spain was made up of separate squares, oblongs, and triangles. Besides this, Saracens also invented a system of ornament in which one pattern was laid over another in low relief, and perfected by colour and gilding. This is magical in effect, for each change of position brings out a new pattern and a new predominating colour. To them, too we owe the perfection of murmonic ornament, formed by overlaying a floral ground with Kufic or other writings, which is as distinctly Moslem as their maddening geometrical ornament or stalactite work. The ancient Egyptians, Persians, Greeks, Romans, and Byzantines produced works infinitely grander and more dignified, and the Greek works were infinitely more beautiful and of a higher style of beauty; but no people have ever produced anything so magical or so sumptuous in colour. The human figure and the representation of any living thing was forbidden by their religion; the Mesopotamians and Persians did even try their hand at this form of art. By the Moslems every handicraft was carried to a perfection before unknown in the world, from the temper of a sword-blade to the weaving of a robe or a carpet. Even now their enamelled glass and pottery, their damascened work, their wooded lattices, coloured work, carpets, and illuminations are in some respects unsurpassed, and fine specimens fetch their weight in gold; and so superior were their works to those of European manufacturers that when the Christians began to imitate their costly stuffs, chased brass, or damascened work, it was a common practice to put Arabic letters on their stuffs and utensils, in the form of texts from the Koran, but meaning nothing, to insure a market. As late as the Porta della Carta at the Ducal Palace at Venice, Arabic letters in imitation of an inscription were put on the dress of one of the figures, the solution of which was long an enigma to scholars. It is quite possible that the real Saracens had no capacity for invention, or the fine arts, at any rate. Scarcely any buildings of great artistic merit have survived them; but supposing they had neither taste nor invention, they would, none the less, claim our admiration and gratitude. They expunged the worn-out civilisation of the world, and imparted to the survivors their own resistless energy, their simple faith, and a lavish generosity, so that their successors, perhaps blessed with higher capacities, overspread the world with elegant and sumptuous monuments from Spain to the Indus, and from the Red Sea to the Atlantic. Every country beneath their sway flourished like a garden. Stock was increased, and the breed of horses greatly improved; every town was a hive of industry, from which issued the most splendid arms and armour, glass, metal, and woodwork, enamelled earthenware, velvet, satin, silk, and cloth of gold of splendid patterns and gorgeous colours; and from them lawns, crèpes, and delicate muslins were spread over the earth; arts and literature, science and speculative philosophy found their homes amongst them, and spread light among the surrounding darkness. The inventions of the East were communicated to the West; not the least of which were the Arab arithmetic, algebra, and the mariner's compass, until they may be said to have been smothered by the wealth and plenty their industry had created. The splendid mosques, tombs, towers of victory, hospitals, khans, and palaces with which the Moslem conquerors enriched India alone, probably exceed in number and magnificence all the monuments of Europe since the Renaissance, not to speak of their bridges, aqueducts, and tanks. New phases of architecture, and new systems of ornament and illumination were invented, and in the later Crusades the manners and morals of the Moslems were held up as patterns to the Christians by their priests. It seems a pity that most of their monuments are perishing by decay, or by more wanton destruction; and when they are gone we shall have but indifferent records of their glory.

THE ACTION OF HEAT FROM OPEN FIREGRATES, STOVES, AND HOT-WATER PIPES.—III.

By F. DYE.

NOTWITHSTANDING the excellent results attained with the modern forms of open grates, with the advantages described in the last paper, they still fall short of the efficiency of stoves and hot-water pipes. It is upon the points of economy and regularity of heat that the grate is behind the other methods of heating; but, as already described, the latter do not possess some good features that the grate has, and for general domestic purposes it is well known that the grate has still the greatest share, if not all, the favour.

From stoves we have the heat transmitted to us in two direct ways; by radiation from the heated surface of the metal, and by convection of the air that comes in contact with the heated surfaces. This differs from open grates, as with these we have no convective action, except from objects warmed by the radiant heat, and this is trifling compared with that which takes place direct from the highly heated plates of a stove. It is supposed that the stove is of a pattern that has the fire inclosed within it, and not made visible anywhere. If the fire is visible, then we get results intermediate between an open grate and a stove; that is to say, the action of each is manifested. There are many stoves made in this way, with visible or open fires, but they cannot very well be made to keep alight for hours without attention, like a close stove can, and unless this can be done we get the irregular heat of the open grate.

What is now being said, of course, refers to stoves that are fixed in the room or apartment to be heated. If the stove is placed in a chamber constructed for the purpose, and the heat conveyed by pipes or conduits to the place to be heated, the action and results are very different. This latter method is termed "heating by hot air," and will be alluded to directly.

It may be supposed that with a close stove placed in a room the two actions by which the heat is transmitted contribute about a half each to the results attained, that is, the radiant heat does about as much towards heating the room as the heat received by convection (warmed air) and *vice versâ*. Now, by referring to the previous papers it will be seen that the air being warmed to this extent is rather opposed to natural results, and to those sufficiently sensitive this way of heating might prove disagreeable. There is, however, another, and greater objection to warming the air, in the fact that it is rendered unnaturally dry. This is a particular drawback, and anyone troubled with bronchial affections becomes very conscious of it, and, in fact, it is unbearable. Everyone knows that the chief objectionable feature of the dreaded east wind is its unhealthy dryness.

It has to be explained that air has, or should have, a certain percentage of moisture in it varying with its temperature, air at a low or cold temperature having, and only being able to hold, a small quantity of water compared to what air can when it is hot. It is peculiar to note that the body is agreeable to this varying degree of moisture, for when the air is cold with its least quantity of water in suspension there is no disagreeable result to speak of; if, however, this air became heated, but without increase of moisture, it would be highly unpleasant and unhealthy. The great difference in this capacity for water that our atmosphere has can be judged by the fact that air at 30° Fah. has, when saturated, only $2\frac{1}{8}$ grains of water in suspension per cubic foot, whereas at 80° it has $10\frac{1}{2}$ grains. The capacity of air for water is about doubled with each increase of 28° to 30° in temperature.

When speaking of the saturation of air, it is meant that the air contains as much water as it can possibly hold. The most agreeable air to breathe is not fully saturated, at least such would be the opinion of most people accustomed to our English climate. A particular purpose that requires a fully saturated atmosphere is a hot-house, and, in fact, all horticultural glass-house works. In fern-houses, for instance, the atmosphere is kept in a state that might almost be described as wet. These places are heated by hot-water pipes, which go a great way to render the air dry by warming the air by convection, and it is a primary thought of the gardeners to see that efficient and amply sufficient means be provided to give the necessary moisture to the air. This is effected with vaporising troughs which are placed upon the hot-water pipes. The heat causes the water in them to give off a vapour, and, furthermore, the air will help itself to water where it has opportunity.

With stoves the difficulty is met by the use of water-pans, and many stoves are provided with these by the makers; some even having them cast, in an ornamental way, upon the stove itself. The only objection to this arrangement is the possibility of rendering the air too moist, which, although not objectionable in sick-rooms with certain maladies, is not a desirable thing when the occupants of an apartment have to go directly in and out of the open air. As a rule, provision for adding moisture to the air is necessary, and without this the air may not only be disagreeable to breathe, but it will, if very dry, help itself to moisture wherever it can, much to the detriment of cabinet-ware and such like.

Doubtless many readers have heard the expression that when a stove becomes overheated it "burns the air." This is often mentioned and used as an argument against stoves generally. The expression is wrong, however, utterly so, for the air by contact with hot stoves does not become burnt (? consumed intended); and even if it did, it would not be accountable for the odour of burning that is generally noticeable at such times. The only effect upon the air when the stove is overheated is to render it still more unhealthily dry than ever, and if the stove is any way near red-heat, then the air will have an odour like scorching materials due to the innumerable particles of matter that are suspended in the air coming in contact with the hot metal. The dust (the purest of air always has some in it) which floats about, particularly in dwelling houses, is composed almost wholly of organic matters, particles of woollen, cotton, and linen material, and a hundred other things that are light enough to be carried up when reduced to such a fine state. This is the cause of the "burnt" sensation that is perceived at such times.

The heating of living apartments by close stoves can hardly be called a success yet: there is opportunity for it to be made so, but it has a very strong opponent in the open fire with its cheerful appearance. If the cheerful effect were by some means abolished from the open fire, its other advantages would hardly be sufficient to keep the stove from conquering it eventually. In many other countries, however, the stove is pre-eminent; on the Continent the large erection of firebrick in the apartment, and in America the basement stove, with its hot-air conduits throughout the house. The latter country, however, is, in its cities, fast adopting the open grate, notwithstanding its rather primitive character.

The particular advantage of the stove (also hot-water and hot-air works) is the regularity of its heat. With a good stove properly constructed one charge of fuel will last many hours without attention, which must give more regular results than the frequent stoking and burning up and going down of the open fire. In addition to this, every heating apparatus which heats the air contributes heat to the body equally on all sides. This is an argument urged against the open fire, of course, which, by radiation, only heats the side of the body which is turned towards it.

One of the most useful and ingenious inventions in connection with the heating surfaces of stoves is the addition of gills or plates, a series of which are placed along the body of the stove externally, and projecting some 6in. to 10in. according to the size of the stove. There are stoves made like this and called "gill stoves," although almost all makers use these gills more or less in some way with stoves that do not bear this name. A gill stove is like Fig. 11. A side section would be as Fig. 12, which shows clearly the gills or plates (or ribs, or wings, as they are sometimes called) standing out from the body of the stove which constitutes the fire-box. The object of the gills is to prevent the stove overheating, and so having an ill effect upon the air, and also from being a source of danger should anyone come against it.

The action of the gills is as follows:—When the outer surface, the shell of the fire-box, receives heat, this heat is as instantly transferred to the gill plates, the heat travelling into them by the rapid conductive power of the metal of which the stove is composed. Now, if we have a certain quantity of heat (we may call it a quantity for the purpose of this explanation) in a piece of metal which raises it to a certain temperature, it follows as a matter of course that if we increase the size of the metal so as to allow the heat to distribute itself more, the temperature will be reduced notwithstanding all the heat is still there. We may compare it to a perfume which as it spreads about becomes less strong to the senses, although it is not lost. It is thus with a gill stove; there is a greater quantity of metal to receive the heat, and although the surfaces are not so intensely hot the greater area of these surfaces compensate, and so we get a large volume of heat at a low temperature, instead of a less quantity at a higher temperature. The result is far more agreeable, the metal does not get so hot as to create odours of any kind, neither should it get hot enough to cause an accident if anyone came in contact with it, as might happen with a plain surface. This kind of stove is well suited for hot-air works.

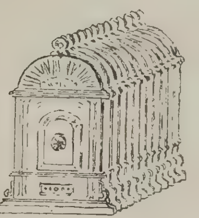

FIG. 11.

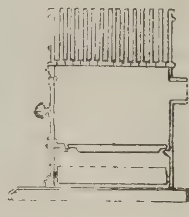

FIG. 12.

For hot-air works the stove (or it may be hot-water pipes) is placed in a brick-built chamber but little larger than itself. Into this chamber is a fresh or cold air inlet, and from it are one or more warm-air conduits, according to the magnitude of the undertaking, these being brick channels (like chimneys) or earthenware or iron pipes. These conduits terminate in the apartments to be warmed. It will be seen that the heat is contributed in this system by convection only, and, although so extensively adopted abroad, it is not approved of here and but little adopted. Warmth that is due to warmed air is equable, as the stove can be so easily arranged to burn and give out heat regularly; it is also fairly economical, as practically the whole of the heat is utilised, and it possesses the advantage of delivering heat to several different rooms or at several points in one room from a single fire. The gain effected, however, is not appreciated in England, and the more advanced we become the less likely is this mode of heating to become popular. It is possible to obtain good results with practical attention, but in dwelling-houses it will not get this. To the best of the writer's belief, the House of Commons is at present heated by hot-air, but there are capable men there to attend to the apparatus. There is the most efficient provision for moistening the air that is heated, with hygrometers to indicate its moistness, and other ways by which the air is purified, sweetened, and rendered as agreeable and healthful as it is possible to get it. Notwithstanding this, however, if the heat could be imparted to the occupants of the house without heating the air the results would be obviously better.

Hood, in one of his editions of "Warming Buildings," alludes to an instance where one of the large clerks' rooms in the Custom House, London, when heated by hot-air, resulted in the major portion of the occupants becoming ill and suffering from symptoms which upon inquiry and examination was found to be due to the stoves being overheated, sometimes red-hot. The air after passing over them was occasionally 110°, rendered intensely dry, and the smell produced by the decomposition of the matters composing the dust which settled upon the stoves was very disagreeable. This apparatus had such a pernicious effect that it had to be removed. It appears, however, that there had been no provision made for adding moisture to the atmosphere, and with such a temperature and dryness the air would rob even the skin and lungs of moisture.

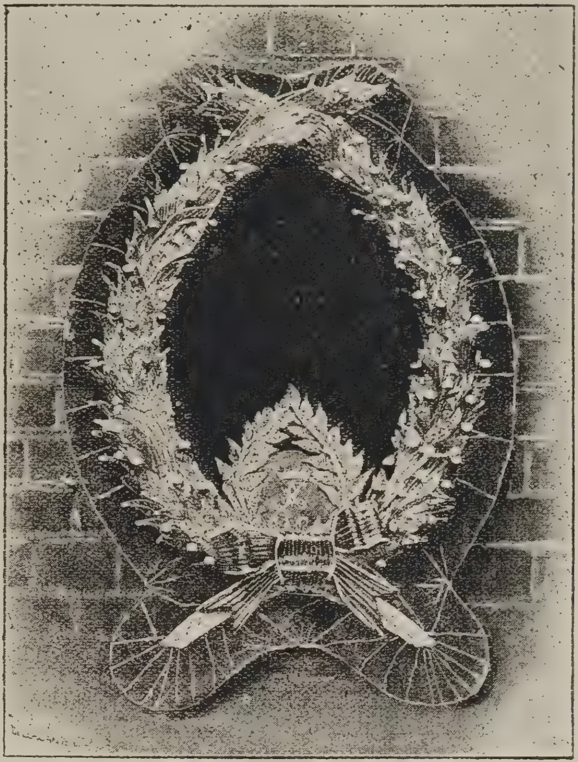
ERRATUM.—In No. 27, read "Wainscot or American Walnut" for "Honduras Mahogany, ordinary sizes."

DR. SALVIATI'S VENETIAN MOSAIC.

ARCHITECTS, and all lovers of real art-work who visit the big show at Olympia, will be sure to find their way to the rear of "Modern Venice," with its gondolas and other attractions, to the most interesting Venetian glass workshop which Dr. Salviati has established there. Never before in England has the opportunity been afforded of witnessing what is one of the few surviving real "art-industries" left to us. Dr. Salviati's assistants are not "art workmen"; they are really artists, and it is a pleasure to watch not merely their deft manipulation of the molten metal, but their thoroughly artistic grasp of its capabilities and the genuine feeling and intelligence they put into their work. The history of the self-denying attempts of Dr. Salviati's father to restore the lost art of working in Venetian glass and the making of mosaics is familiar to all readers of our earlier volumes. The encouragement Dr. Salviati received in England from the great English architects of the past generation is also well-known, and it is gratifying to know that this is being continued. We saw last Sunday at the Church of the Annunciation, Chislehurst, one of the most beautiful specimens of mosaic ever erected, and we hope to describe and illustrate it shortly.



We give herewith an illustration of the Venetian glass wreath made by Dr. Salviati's Venetian glass-artists for the Duke of Clarence's funeral. It, of course, conveys as faint an idea of the real thing as a black and white picture of a stained-glass window; but the form, at any rate, is shown of what was a beautiful tribute of sympathy. The wreath was composed of laurel-leaves interlaced with lilies of the valley and other emblematical flowers and golden oak-apples, all made in glass, and bound together by glass ribbons of amber edged with white, the symbolic colours of Death. In the centre was an inscription setting forth the dedication of the wreath by its makers. We may add that some of the reproductions of antique models of Venetian glass shown at Olympia, in Dr. Salviati's rooms there, are simply perfect as regards form and their marvellous reproduction of the iridescence of the originals, and that the modern work is characterised throughout by a real elegance and fitness of design which cannot be too highly commended. We regret to hear that the glass furnace will not remain in England after the close of the exhibition, and advise all who are interested to take the earliest opportunity of seeing it.

THE TACHEOMETER AS A SURVEYING INSTRUMENT.

THE Engineering Section of the Royal Society of New South Wales, held at Sydney, had had an interesting paper read before it by Mr. W. Poole on this instrument, and its application to engineering surveys in New South Wales. The author of the paper expressed his surprise that instruments such as the tacheometer are not better known in the colony for preliminary work. In this country the Ordnance Survey maps supply all the information required, and therefore the tacheometer is not much used, and British engineers have not on this account introduced it into the colony. On the Continent and in America it is very generally used for topographical and preliminary surveys. The value of the tacheometer is that at a single observation the elements of height, distance, and azimuth may be obtained. Great rapidity of operation is one of its chief advantages. Mr. Poole gave a description of the instrument, and showed one of Messrs. Troughton and Simm's of improved make. The tacheometer resembles a transit theodolite with a superior telescope fitted with a distance measuring arrangement. It can be used for all purposes for which the theodolite is used, and owing to the sensitiveness of the telescope-bubble and its high-power lenses, can be used with great accuracy for ordinary building operations. The results obtained by the tacheometer when compared with those by the level and chain, leave nothing to be desired. Thus, the author says, two points were found by careful chaining and levelling to be 1666·2ft. apart, and 66·31ft. different in reduced level; by the tacheometer the distance was found to be 1665·4, and 56·23ft., and the difference of reduced levels between the two methods was 1 in 829, which is small. For use in topographical work this instrument has been found to be very reliable. Only one attendant to hold the staff is required for small areas. From the Report of the United States Lake Survey the error of closure of 141 lines on an average of 1½ miles in length, was found, compared with the distances found by triangulation, to have a mean result of 1 in 650. The length of sight between stations averaged 800ft. to 1,000ft. The official limit of closure was 1 in 300. Those interested in surveying will find much useful data and information in Mr. Poole's paper, a full report of which is given in the Melbourne *Building and Engineering Journal*.

CHIPS.

An anonymous offer of a gift of land on which to erect a Roman Catholic church, monastery, and school at Hythe, Kent, has been made conditionally upon the erection within the year of one of the buildings.

The annual dinner of the Clerks of Works' Association will be held at the Holborn Restaurant on Monday, Feb. 15th, under the presidency of Mr. Aston Webb.

At the last meeting of the Bournemouth town council 18 tenders were opened for lighting the pier, gardens, and offices with electric light, ranging from £6,302 to £1,438. It was decided to refer them to an expert.

New City and County banking premises are in course of erection at the corner of Park-street and Bond-street, Leeds. Corinthian in character, the works are carried out in Bradford stone for the exterior, the whole of the internal walls of the bank proper being lined with Burmantofts faïence. Messrs. Smith and Tweedale, of South-parade, Leeds, are the architects. Messrs. W. Nicholson and Son, of Hunslet, are the contractors, and the carving is being executed by Mr. Appleyard, of Leeds.

ROYAL ACADEMY CARTOON FROM "ST. AUGUSTINE PREACHING CHRISTIANITY IN ENGLAND."—NOS. XVIII. TO XXIII. CHEAPSIDE.—CONVALESCENT HOME NEAR SWANLEY.—GALILEE, DURHAM CATHEDRAL.—CHURCH DOOR, KILPECK, HEREFORD. — PUBLIC LIBRARY, BERMONDSEY. — NEW BUILDINGS FOR THE YOUNG MEN'S CHRISTIAN ASSOCIATION, CORK.—SCREEN IN DRINKSTONE CHURCH, SUFFOLK.

Our Illustrations.

R.A. CARTOON FROM "ST. AUGUSTINE PREACHING CHRISTIANITY IN ENGLAND."

IN our double number, published on January 1st last, we gave a double-page plate of Mr. P. R. Montford's Royal Academy prize design for the decoration of a public building, the subject of which was "St. Augustine preaching Christianity in England." To-day we have reproduced Mr. Montford's large cartoon, illustrating the same subject in detail. It represents the figure of a deacon standing on the steps of the Cortile of the ruined Roman Palace in the middle picture to the right of the central group in the composition.

BUSINESS PREMISES, CHEAPSIDE.

THESE premises, now in course of erection, have a frontage to Cheapside of 60ft., and a depth of 200ft., and comprise four large warehouses, each having basement and four floors over, with two additional floors to front block, all approached by means of a cul-de-sac roadway, and arranged for letting as separate buildings or in floors. Two stone staircases are provided, with hydraulic passenger and goods lift to each, which are being carried out by Messrs. Richmond and Co. The front block has not been rebuilt, as it was erected by Messrs. Caldecott and Co. about 15 years ago, but has been remodelled internally, and the whole of the front cut down and rebuilt in Portland stone, the carving being executed by Mr. Gilbert Seale. The front to the cul-de-sac is in Portland stone up to first floor, and in white glazed bricks, with Portland stone dressings, above. The works are being carried out by Messrs. W. Brass and Son—Mr. Reynolds being leading foreman—from the designs and under the superintendence of Mr. T. H. Smith, architect, of 17 and 18, Basinghall-street, E.C.

CONVALESCENT HOME NEAR SWANLEY.

THE building was planned for a hilly and broken site, suggestive of a partial basement, which is utilised in the design for the kitchen and servants' offices, entered at a lower level than the remainder of the Home. It was also proposed to adapt some existing buildings at the lower level as larders, stores, &c., connected with the catering department of the institution. One of the conditions imposed on the architects was that the building, while forming a complete whole in the first instance, should be capable of extension for additional accommodation in the future. With this end in view, the dining-hall and servants' departments were designed upon an ample scale to meet the requirements of either scheme, and the contingent increase in accommodation was secured by lengthening the main block of the building in both directions as required. The rooms set apart for the patients of both sexes open upon a long, level plateau on the south-east side of the building, commmanding beautiful views of the adjoining country. The central tower was arranged to contain water tanks for supplying fire-mains and working hydraulic lifts in various parts of the building. The plans were prepared by Messrs. Wood and Ainslie, of 35, New Bond-street, W. The perspective view is reproduced from a drawing hung in the last Royal Academy Exhibition.

THE GALILEE OF DURHAM CATHEDRAL.

WE are indebted to Mr. George Bankart, of Leicester, for these two beautiful photographs which we reproduce to-day among our illustrations. The unique structure in England which goes by the name of "the Galilee" of Durham Cathedral is as well known as the church to which it is attached. The original purpose, however, for which it was erected and used is quite obscure. Mr. Wm. White, F.S.A., read an exhaustive paper on the subject before the R.I.B.A. in March, 1890. He said the several and diverse traditions respecting it were not only at variance with each other, but no one of them accounted for certain architectural features found in it, or for its name. In many instances it had been called the Galilee porch, the Galilee chapel, or the Lady chapel. The prevailing idea was that it had been built for a chapel; but this theory seems untenable. The alleged separation of the Galilee from the church for the first 200 years militated against the idea of its being recognised as a Lady chapel. The word Galilee, which signified "circuit," was originally applied to the circuit of the country around Kadesh Naphtali, occupied chiefly by strangers, and it is thought that the Galilee at Durham took its rise from that association of ideas and circumstances, it being the Court for causes extra-ecclesiastical. Bishop Hugo Pudsey, from the best authorities, built the Galilee as a court external to the Cathedral, though in contiguity to it, to serve not only as his Palatine Court, but also for his regal court of justice, both criminal and civil cases coming before him as Prince Bishop and Chief Justiciary under Richard I. Although there existed in England several so-called Galilee porches, there was but one besides Durham, that at Ely, and Ely had also been the see of the Prince Bishop, who was also Chief Justiciary. In ancient documents the Galilee of Ely was spoken of as "*Curia vocata le Galilee*," which, had it never been used as a court, was, to say the least, rather curious. In several parish churches in England there were western porches, with chambers attached, external to the church, which had by some been called the Galilee. These might have been used as courts, where they were large enough; but in the chamber over the porch at Snettisham Church, Norfolk, a notable example, there is hardly room to stand upright. Others exist at Melton Mowbray, Wigginton, Berks, and Croyland Abbey. The narthex is believed to have been used by penitents. At Cluny and Vézélay it is probable that the 13th century tribune was intended for some such purpose as above indicated at Durham. At the cathedral at Tuam the choir was used as a court or "*curia.*" Worksop Abbey shows on the south side of the choir a Galilee older than that at Durham, and one is believed to have existed at Fountains Abbey.

DOORWAY, KILPECK CHURCH, HEREFORDSHIRE.

THIS beautiful doorway from this interesting little church, situated in the Forest of Haywood, near the Wye, which we illustrate to-day, is a typical specimen of Norman work. The "tree of life" is represented in the tympanum as a highly conventionalised composition of foliage, and there are no human figures introduced. The shafts to the doorway are enriched by large dragons, and the arch is elaborated with the signs of the Zodiac.

PUBLIC LIBRARY, BERMONDSEY.

THE Public Library, Bermondsey, is one of the most complete and best lighted in London. The principal entrance—in the centre of the building—emphasised by an Ionic portico, leads to a spacious hall and staircase, 15ft. wide. On the right is the newspaper reading-room, 41ft. by 33ft., in which, on handsome stands, are provided upwards of 80 English, Scotch, and Irish newspapers. Immediately opposite the entrance is the lending library, 41ft. square, fitted with cases for 20,000 vols. The counter space is nearly 40ft. long. The librarian's room and residence, having private access to lending department, adjoins the main entrance, thus giving complete control of the building. The stone stairs consists of central and return flights, which terminate in the large first-floor landing, paved with marble mosaic. The landing is arcaded at sides, and has large cove with lantern light in centre. The reference library is 41ft. square, with a domical roof in centre, supported by four Corinthian columns. It is well lighted by the clerestory at the base of the dome, also by the windows in the side walls. The reading tables are in the centre; the bookcases are arranged on the alcove plan around the sides. Next the landing is the magazine reading-room, which is 41ft. by 24ft., this department being made a prominent feature. Adjoining is the ladies' reading-room, 20ft. by 16ft., with lavatory accommodation. On this floor is the Commissioners' committee room, 24ft. by 16ft., with separate access from the exterior. The whole of the second floor is exclusively occupied by the librarian's apartments, forming a complete residence, with bath, larders, stores, coal-lift, and every residential convenience. In the basement are provided lavatories, &c., for the general readers, also a large space for additional book-store when required, a bookbinding room, a general store-room, coal-cellar, and heating chamber. There is a side entrance for cases, &c., also special staircase for attendants, with a book-lift, so that every portion of the building can be conveniently reached without entering the principal staircase. The architect is Mr. John Johnson, A.R.I.B.A., 9, Queen Victoria-street, Mansion-house, E.C., whose design was selected out of 57 submitted in public competition. The builders are Messrs. F. and H. F. Higgs, of Loughborough Junction; the quantities were prepared by Mr. H. Lovegrove. The exterior is of Renaissance character, freely treated, executed in Red Elham bricks, with dressings of Monk's Park bathstone. The carving has been carefully executed by Mr. Baird, of Herne-hill, from the architect's designs; the central figures of "Literature and Science" are by Mr. Lawlor. The central turret was introduced to give height and dignity to the front on account of the imposing, massive character of the adjoining town hall.

YOUNG MEN'S CHRISTIAN ASSOCIATION, CORK.

THIS Association has taken the old Baptist Chapel and surrounding ground in Marlborough-street, Cork, and is about to erect a Y.M.C.A., to include all the requirements which young men expect in this civilised age. In addition to the chapel, which will be used as an assembly-hall, there are several reading and class rooms, and also a large gymnasium, dressing-room, bath, and lavatory-room, and abundant sanitary accommodation, and even a photographic-room and cycle stable are included. The arrangements are shown in the accompanying illustrations. The architect is Mr. W. H. Hill, F.R.I.B.A., Cork, and the plans having been adopted are about to be thrown open to competition.

SCREEN IN DRINKSTONE CHURCH, SUFFOLK.

THE drawings which we reproduce obtained a National bronze medal last year. Drinkstone Church is situated about seven miles from Bury St. Edmunds. Although the entire church is architecturally poor, the rood-screen is of a very high class of workmanship. It is of 14th-century date, and has not been restored. The colour on it is original, and the gilding is very thick. It was removed by the present rector from the arch under the tower at the west end to its proper position about twenty-five years ago. Mr. Walter Brand made the drawing.

◆

Dr. Frederick Leighton, father of the President of the Royal Academy, died at his residence, 11, Kensington Park-gardens, on Sunday night. Dr. Leighton, who was for some years in practice as a physician at Scarborough, was ninety-three years of age.

The Congregational Chapel at Sandwick, Shetland Isles, was reopened last week, having been taken over by the Free Church and renovated. A new pulpit and fresh seats have been provided, and the lighting and ventilation improved. Mr. William Thomson, of Hoswick, and Mr. Lawrence Mouat, of Lower Culliston, executed the masonry works, and Mr. Malcolm Duncan the joinery.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations,* and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances,* under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance,* as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names. We cannot keep the list open long, so those desirous of being included should *send in their instructions at once,* as when the allotted space is full no more names will be received this year.

Whittaker and Co. (Practical and Technical), 2, White Hart-street, Paternoster-square, London, E.C.

BRICKS—
Accrington Brick and Tile Co. (Facing Bricks, Plastic and Semi-Plastic), 8, St. James-street, Accrington.
Gibbs and Canning, Ltd. (White Glazed), Tamworth.
Heather Brick and Terracotta Co, near Ashby-de-la-Zouch.

BRICK AND TILE MACHINERY—
Clayton Howlett Co., Woodfield-road, Harrow-road, W.

BUILDING & QUANTITY SURVEYORS—
Anderson, A. E., 36, Victoria-road, Northampton.
Flew, J., 11, Popplewell Chambers Bradford.

BUILDING COMPOSITION—
White, W., Great Western Works, Abergavenny.

CASEMENTS AND WINDOWS—
Burt and Potts, 38 and 65, York-street, Westminster, S W.
Wragge, Geo. (Wrought Iron, Steel, and Gunmetal), Wardry Works, Chapel-street, Salford.

CEMENT MANUFACTURERS—
Rugby Portland Cement Co., Rugby.

CEILING DECORATIONS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

CONCRETE—
Fambrini and Daniels, Excelsior Art Concrete Works, Lincoln.

CURTAIN BLINDS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

DECORATORS—
Campbell, Smith, and Co., 75 and 78, Newman-street, London, W.
Lamb, J. (Specialist), 14, Marlbro'-road, Turnham Green.

DEVONSHIRE MARBLE—
Goad, J. and E., Phœnix Steam Marble Works, Plymouth. (See Brompton Oratory.)

ELECTRIC BELLS—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.
Teale and Somers, Electricians, Leeds.
Wright, Archibald J., 7, Beaumont-road, Hornsey-rise, London, N.

ELECTRIC LIGHT APPLIANCES—
Macfarlane, Walter, and Co., Saracen Foundry, Glasgow.

FANLIGHT OPENERS—
Osborn, David, High-street, Berkhamsted.

FIBROUS PLASTER—
Plastic Decoration and Papier Mache Co., ltd, 21, Wellington-street, Strand, London, W.C.

FIREPLACES—
Edwards, F, and Son, 54, Great Marlborough-street, W. (see advt. p. V.)
Teale Fireplace Co. (Teale and Somers), Leeds.

FIREPROOF FLOORS—
Lindsay Neal, W. H., and Co., 15, North Wharf, Paddington.
Phœnix Fireproof Flooring Co., 9, Oxford-street, Manchester.

FIREWOOD SPLITTING & BUNDLING MACHINERY—
Glover, M., and Co., Patentees and Saw Mill Engineers, Leeds.

FURNITURE—
Foster and Cooper, 63, Long-row West, Nottingham.

GASFITTERS—
Beaven and Sons, 38, Eastgate-street, Gloucester.

GRANITE MERCHANTS—
Webb, Percy C., 41, Eastcheap, London, E.C.

GRATES—
Edwards, F., and Son, 54, Great Marlborough-street, W. (see advt. p. V.)

HEATING APPARATUS—
Boyd, Jas, and Sons, Paisley.
Edwards, F, and Son, 54, Great Marlborough-street, W. (see advt. p. V.)
Grundy, J, 30, Duncan-terrace, City-road, London, N.
Teale Fireplace Co. (Teale and Somers), Leeds.

HORTICULTURAL BUILDINGS—
Boyd, Jas., and Sons, Paisley.
Gloucester Railway and Carriage and Wagon Co., Gloucester.
Macfarlane, Walter, and Co., Saracen Foundry, Glasgow.

HYDRAULIC RAMS—
Blake, John, Oxford-street Works, Accrington, Lancashire.

INTERIOR WOODWORK—
Foster and Cooper, 63, Long-row, Nottingham.

IRON AND STEEL GIRDERS—
Walmsley, B, 15, Mawdsley-street, Bolton.

IRONFOUNDERS—
Hayward Bros. and Eckstein, 187, 189, 191, and 193, Union-street, Borough, London, S.E. (see advt. on p. III.)

JOINERY—
Brock, W., and Sons (and Woodwork of all Descriptions), Albert-road, Bristol.
Elliott, Saml, Albert Joinery Mills, Newbury.
Gloucester Railway and Carriage and Wagon Co., Gloucester.

JOINER'S OILSTONES—
Whittle Hill Hone Co., Charley Forest, near Loughboro'.

LIGHTNING CONDUCTORS—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.
Morris & Gold, Wardrobe Chambers, Queen Victoria-st., E.C.
Teale and Somers, Leeds.

LIFTS AND CRANES—
Waygood, R, and Co., Falmouth-road, Gt. Dover-street, S.E.

LIME BURNERS—
Rugby Portland Cement Co., Rugby.

LOCKS—
Colledge and Bridgen, Wolverhampton.

MARBLE WORKERS—
Emley and Sons, ltd., Marble Works, Newcastle-on-Tyne.
Patteson, J. and H., 36 and 38, Oxford-street, Manchester.

MOSAIC WORKERS—
Patteson, J. and H., 36 and 38, Oxford-street, Manchester.

PAINTS—
Torbay and Dart Paint Co, ltd., Dartmouth.

PAPERHANGINGS—
Land, J. and H., 93, Cannon-street, E.C.

PASSENGER LIFTS—
Waygood, R., and Co., Falmouth-road, Gt. Dover-street, S.E.

PAVEMENT LIGHTS—
Hayward Bros. and Eckstein, 187, 189, 191, and 193, Union-street, Borough, London, S.E. (see advt. on p. III)

PAVEMENT ROLLERS—
Gilchrist, Alex., 25, Eglinton-street, Glasgow.

PERSPECTIVES—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

PHOTO-LITHOGRAPHY—
Whiteman and Bass, 236, High Holborn, W.C.

PIPES—
Gibbs and Canning, Ltd. (Glazed Stoneware), Tamworth.

PLATE GLASS—
Newton, John M. (Bevelled and Silvered), 21, Charles-street, Hatton-garden, W.C.

PLUMBERS—
Beaven and Sons (Sanitary, Hot Water, and General), 38, Eastgate-street, Gloucester.

QUANTITY LITHOGRAPHERS—
Pettitt, T, and Co, 22 and 23, Frith-street, and 50, Old Compton-street, London, W.

RAIN WATER SEPARATORS—
Roberts, C. G., Haslemere, Surrey.

SANITARY APPLIANCES—
Gibbs and Canning, Ltd, Tamworth.
Macfarlane, Walter, and Co, Saracen Foundry, Glasgow.

SANITARY ENGINEERS—
Sanitary and Domestic Engineering Co., Principal: Irwin C. Wallas, The Sanitary Works, Kilburn, N.W.

SCULPTORS—
Read, Herbert (and Church Fitting Maker), St. Sidwell's Art Works, Exeter.
Roddis, J. (and Church Fittings), Aston-road North, Birmingham.

SINKS—
Gibbs and Canning, Ltd. (Cane-colour Glazed), Tamworth.

SLATES—
Tilberthwaite (Westmoreland) Green Slate Co., Kendal.

SPEAKING TUBES—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.

SPECIAL ENGINEERING BRICKS—
Accrington Brick and Tile Co., 8, St. James-street, Accrington.

STAINED-GLASS—
Adam, Stephen, and Co. (formerly Adam and Small), Glasgow.
Camm, T. W., High-street, Smethwick, Birmingham.
Worrall, W, and Co, 75, Endell-street, London, W.C.

STAIRCASES—
Hayward Bros. and Eckstein, 187, 189, 191, and 193, Union-street, Borough, London, S.E. (see advt. on p. III.)

STABLE FITTINGS—
Hayward Bros. and Eckstein, 187, 189, 191, and 193, Union-street, Borough, London, S.E (see advt. on p. III.)
Macfarlane, Walter, and Co., Saracen Foundry, Glasgow.

STEEPLE JACKS—
Morris & Gold, Wardrobe Chambers, Queen Victoria-st., E.C.

STONE—
Thompson's Ancaster Quarries Co, Ltd. (Ancaster), 11, Elmer-street, Grantham.
Fielding, J. (Alton Stone, Red, White, and Mottled), Alton, Staffordshire.

STONE WORKING MACHINERY—
Powis Bale, M., and Co., Appold-street, London, E.C.

STOVES—
Edwards, F., and Son, 54, Great Marlborough-street, W. (see advt. p. V.)
Teale Fireplace Co. (Teale and Somers), Leeds.

TELEPHONES—
Gray, J. W., and Son, 113, Leadenhall-street, E.C.
Teale and Somers, Leeds.

TERRA-COTTA—
Accrington Brick and Tile Co. (and Ornamental Brickwork) 8, St. James-street, Accrington.
Pulham, J., and Son, 50, Finsbury-square, and Broxbourne, Herts.
Thompson, Jabez, Northwich, Cheshire.

TILES—
Carter and Co. (Encaustic, Mosaic, and Faience), Poole, Dorset.

TRACINGS—
Finsbury Drawing and Photo-Copying Office, 113, Pavement, E.C.
Marshfield and Co. (Photo-copied), 5, Little Queen-street, Westminster, S.W.

VENETIAN MOSAICS—
Dr. Salviati, 213, Regent-street, London, W.

VENTILATION—
Acme Ventilating and Heating Co., Liverpool and London.
Blackman Ventilating Co., Ltd., 63, Fore-street, London, E.C.
Buchan, W. P., R.P., S.E., 21, Renfrew-street, Glasgow.
Gibbs, John, and Son, 27, South John-street, Liverpool.
Hayward Bros. and Eckstein, 187, 189, 191, and 193, Union-street, Borough, London, S.E. (see advt. on page III)
Howorth, Jas, and Co, Victoria Works, Farnworth, Bolton.
Teale Fireplace Co. (Teale and Somers), Leeds.

WATER CLOSETS—
Bostel and Son, 73, Ebury-street, S.W.

WIREWORK—
Clark, John, 25, 46, & 47, High-street, New Oxford-street, W.C

WOOD BLOCK FLOORING—
Gregory, T., and Co., Station Works, Clapham Junction, S.W.
Lowe, Roger L., Worsley-road, Farnworth, Bolton.
Midland Flooring Co, St. Mark's-road, Wolverhampton.

WOOD CHIMNEY PIECES—
Foster and Cooper, 63, Long-row, Nottingham.

WOOD-WORKING MACHINERY—
Butler, Sydney, Park Works, Langley-lane, Vauxhall, S.W.
Reynolds, F. W., and Co., Acorn Works, Edward-street Blackfriars-road, S.E.

WROUGHT-IRON GATES, GRILLES, &c.
Teale and Somers, Leeds.
Worrall (Specialist), Byrom-street, Liverpool.

ZINC WORKERS—
Thomerson, Chas., 263 and 265, Hackney-road, N.E.

Measured and Drawn by
Walter Brand
December 1890.

WAYSIDE NOTES.

MR. MACVICAR ANDERSON well sustained the reputation he has earned as President of the Institute for upholding architecture in a practical common-sense light, when, on Monday evening, he addressed the assembly of students at Conduit-street. This is no small gain at a time like the present, when argument and discussion cause so many to take extreme views, either as apostles of the hyper-artistic, or of the commonplace and matter-of-fact. Mr. Anderson's exhortation to the study of planning should be taken to heart by the student, especially such as are likely in the remote future to blossom into competing architects. Time was when elevation and perspective won the prize nine cases out of ten, and the days are yet evil; but the more general appointment of competent assessors has altered the old aspect of affairs considerably, a good plan now frequently carrying all before it. As hinted in the Presidential address, the planner's work is of itself very fascinating, and when the early difficulties of the tyro, and the drudgeries of student days are overcome, planning is its own reward to anyone of the true mould of an architect. Many will confirm the truth of this.

In the last number of the *Board of Trade's Journal* is published a report of the British Consul at Chicago, with respect to the excessive height to which buildings in that city are carried, and from this one may gather that even in America they are pretty sick of the "sky-scraper." It is instructive to learn from this report that the fire insurance people in Chicago do not consider buildings of iron, or steel and concrete, properly fireproof, even when the constructive metal-work is covered with casings of terracotta and like material; and an increased danger in case of fire arises in connection with tall buildings. They are out of reach of the fireman's hose, and, if the fire originates in the upper story, our consular report says that the firemen have to wait till the fire burns down low enough to be within reach of the jet of water! It is stated that these "sky-scrapers" of Chicago run from ten to twenty stories in height, and the highest attains an altitude of 275ft.! The suggestions made regarding the future prevention of this ridiculously tall building are that in streets under 66ft. wide, the height of the building should not exceed once-and-a-half times the width, and that buildings in streets over this width should be limited to a height of 120ft. to the highest part of the roof. It will thus be seen that the people, or a certain section of the people, of Chicago, are willing to tolerate a greater altitude in buildings than we are in this country, in spite of such vulgar intruders into the architectural company as the buildings at Westminster and at the end of Sloane-street.

The Rochester Cathedral restorationists contemplate, I believe, a thorough "restoring-back" to a certain date. If this be really so, the old building may be regarded as destroyed in such portions as are affected by the schemes. I like the weather-beaten old west front as it stands. Judging by the view of this elevation in Dugdale's "Monasticon," the effect of the two flanking towers carried up to above the height of the present turrets, and crowned respectively with octagonal and sprocketed roofs or spires, is not to be coveted, the towers being out of all harmonious relation to the central mass, and crowded too close to it. The old central spire at the crossing of the cathedral, shown in Ireland's "Picturesque Views of the Medway," is altogether a modest affair, and wholly unsuggestive of the pretentious and lofty feature of whose contemplated erection we have heard so much.

All architects should have more than a superficial knowledge of geology, either with reference to materials or sites. Professor Lobley's paper, read before the Society of Architects on Tuesday, dealt with the former aspect of geology with regard to the works of an architect. I fancy that if architects possessed themselves with a real fund of sound information in the matter of building stones, that they would be less timid in adventuring any new material put before them, providing, of course, that from their knowledge of geology and geological principles the stone seemed to recommend itself. In this matter, architects are very shy and conservative, but such an attitude must rise, in great measure, from ignorance. New stones are brought before our notice, and, not having the knowledge that gives confidence, and a power of discerning good from evil, we do not avail ourselves of the opportunities afforded. Papers such as Professor Lobley's should therefore be immensely useful in this way.

A correspondent of the *Standard* thinks that the makers of the proposed new turret-clock for St. Paul's Cathedral will have all their work cut out in beating the Westminster Clock, the time-keeping qualities of which, he says, "are as near perfection as we can ever hope to attain in a turret clock, and are certainly far in excess of the practical needs of the public." The clock is in electrical communication with Greenwich, and it is stated that during a year's continual observation—with the exception of fourteen days, when the signals failed—the error of the clock was insensible on 42 per cent. of the days of observation. It amounted to one second on 29 per cent., to two seconds on 22 per cent., and to four seconds on 2 per cent.; for confirmation of which see the *Horological Journal* for July, 1891. This is surely a wonderful clock, and hard to beat. The correspondent omits to explain the cause of the slight variations of the clock; but I believe that pressure of the wind on the large hand has much to do with this. Moreover, a clock mounted high in a tower, however solidly built, must be more or less affected by vibrations. Putting the Westminster clock in the most favourable position for record-breaking "going," it should give some very extraordinary results indeed.

The advocates of the proposed new street between Holborn and the Strand by way of Clare-market are not letting matters slide for want of a little ventilation of the subject, as witness the recent meeting at the Holborn Town-hall. The object of the meeting was to urge the matter upon the County Council, and put forward the advantages of the route by way of Vernon-place, Bloomsbury, Kingsgate-street, Holborn, Lincoln's Inn-fields, and Clare-market, as against the County Council's scheme for a route by way of Little Queen-street. The respective costs of the two rates are estimated at £600,000 for the one advocated by the meeting, and £933,000 for the County Council's route. Putting aside cost, it has always appeared to me that the proper place for this new street is through Clare Market, and that one well-planned thoroughfare will suffice. Branches to the Law Courts and Waterloo Bridge have been proposed, but the necessity of such additional works does not appear to be evident, whilst Wellington-street and the thoroughfares north of it, and Chancery-lane and Gray's Inn-road, exist. If London is made all street, where are the houses going to stand?

I see from the report of the half-yearly general meeting of the G.E.R. that the company are about to lay out £30,000 in the erection of cottages for their men. It being important that the men should be near their work, the company propose to erect these cottages all over their system. The cost is estimated at £225 single and £450 double. This is a good work among many others of the Great Eastern Railway Company. As regards the extensive building operations that have followed the demolition of the Paul Pindar block of houses in Bishopsgate-street, the Company have for some time had a new arrival platform open, and the statement made at the meeting was to the effect that two new lines with an island platform would be ready by July for passenger traffic during the summer months.

If there is one thing at which I look with doubt and misgiving it is a bundle of statistics. The noble science of mathematics may be made, to the eyes of the superficial, to prove so many lies to be truth that one gets unusually cautious where figures are brought in support of suppositions. Nevertheless, it may be that reliance is to be placed on the statistics lately furnished by a correspondent of the *Standard* with regard to the exceptional healthiness of Folkestone. Folkestone has come out very very advantageously in regard to death-rate of late; but then the influenza epidemic has been so erratic in its choice of places for extraordinary ravages, that ordinary averaged death-rates at different places seem to be upset. Thus Brighton is an exceptionally healthy place, by common consent, with a low death-rate; yet the last few weeks have put it near the head of the lists—at the wrong end. Speaking from practical knowledge of Folkestone, and ignoring statistics, be they good or bad, I should readily admit that it is an extremely healthy and invigorating seaside resort, and not only healthy, but pleasant. There should, however, be no need to extol the virtues of a town so well known and much visited in the holiday season. Folkestone has been—judging as an outsider—uniformly prosperous and flourishing for many year past, and should prosper in the future without the help of statistics, which are always more or less misleading, and never reveal the whole truth. GOTH.

CHIPS.

Work was commenced last week at Castleton, near Rochdale, in getting out the foundations for new machine works. Mr. T. Taylor is the contractor.

It has been decided to isolate completely La Sainte Chapelle, Paris, from the Palais de Justice and other buildings.

The guardians of Toxteth Union, near Liverpool, at their meeting on Thursday, the 21st inst., decided, after prolonged and adjourned discussion, to erect a new workhouse infirmary, in accordance with plans prepared by Messrs. C. O. Ellison and Son, MM.S.A., of Liverpool. The estimated cost is £35,000, exclusive of painting and furnishing.

The late Mr. Magniac having left no will, the administrators of his estate will be compelled to dispose of the famous "Colworth collection." The sale will probably take place in June, at Messrs. Christie's.

A statue of Martin Luther is to be erected in Berlin. The city authorities and the Emperor have each given £2,250 towards the cost.

At a meeting of the council of the Royal Society of Painter-Etchers, held last Friday, Professor Hubert Herkomer, R.A., was elected to the vacant Fellowship; and Charles Bird, and W. T. B. Roberts, late Master of the Winchester School of Art, were elected Associates of the Society.

The vicar of Carnarvon has decided upon having the ancient parish church of Llanbeblig thoroughly restored. The whole church will be reseated and warmed, some of the galleries will be taken down, a new organ-chamber built, and a new organ purchased of Messrs. Halmshaw, of Birmingham. A font for immersion will be placed in the baptistery. A stained-glass window will also be placed in the old sacred edifice. The graveyard will also undergo improvements. The plans and specifications for the works have been prepared by Mr. R. G. Thomas, architect, of Menai Bridge.

The City Court of Common Council have resolved to place a stained-glass window in the Guildhall as a memorial of the late Duke of Clarence.

Messrs. William Godwin and Son, of the Lugwardine Tile Works, Withington, Hereford, have received the following communication from London:—"We much regret that, owing to the death of H.R.H. the Duke of Clarence, the tiles intended for his establishment, and which are on order with you, will not now be required. If you can stop them, or any part of them, we shall be obliged."

The fourteenth annual meeting of members of the Royal Scottish Society of Painters in Water-Colours was held on Friday in Edinburgh. The president, Mr. Francis Powell, occupied the chair. The balance-sheet for the past year showed an income of £302 17s., and an expenditure of £343 17s., the balance at the credit of capital account being £815 18s. 2½d. The following elections took place:—President, Francis Powell, R.W.S.; vice-president, William M'Taggart, R.S.A.; treasurer, A. K. Brown; auditors, William Young and John Smart, R S.A.; secretary, J. Wright Robb.

A two-light window has been inserted in the north aisle of Holy Trinity Church, Weston-super-Mare. It is composed of fragments of ancient painted glass of the 13th, 14th, and 15th centuries. Each light is divided into three compartments, the lowest containing the glass of the 13th century, the middle compartment that of the 14th century, and the upper compartment that of the 15th century. The whole has been arranged and releaded by Mr. Bell, of College-green, Bristol.

FIRES IN LOFTY BUILDINGS.

THE British Consul at Chicago has reported on the attempts being made to limit the heights of buildings there. The Chicago Fire Underwriters' Association, which includes all American and foreign insurance companies, with one exception, of importance in the city, has for some time had under deliberation the advisability of limiting the heights of the tall buildings which have lately been constructed in Chicago, and has adopted a resolution that all office buildings of non-combustible construction should be limited in height to not more than one-and-a-half times the width of the street upon which they are constructed, and on streets of more than 66ft. in width the height should be limited to 120ft. from the street to the highest point of the roof; also that all buildings of other than fireproof construction should be limited in height to 85ft. from the street to the highest point of the roof. The Consul adds that although these lofty buildings have been considered absolutely fireproof and solid, being constructed of steel columns, girders, and joists, with a facing of brick or hollow tile, their safety, in the opinion of the Fire Department, cannot be relied upon in case of fire, for no effective stream of water can be thrown to such a height. If a fire breaks out in the upper part of a tall building, the firemen must wait till the fire reaches a level to which the water can be thrown. For this, and other reasons, such as the dangerous expansion of iron and steel under intense heat, and the possible fall of the upper stories through the lower, the Department regards these buildings as dangerous, more particularly when used for store or mercantile purposes. The municipal authorities have also taken into consideration the question of these tall buildings for this and other reasons, such as the health of the city and the congestion of the streets, likely to result from accumulation of business in a limited area; but at present there does not appear to be any law which can be put in force to restrict them, except on the grounds of safety or health. These buildings are from ten to twenty stories in height, and the loftiest are 275ft. high.

NEW SANITARY REGULATIONS.

BUILDERS of small, as well as large, houses will now have to be very careful about their sanitary provisions. Unhappily for the public health, these matters have been shelved; there has been no law in London to compel the provision of certain offices. Now the operation of the Public Health (London) Act, 1891, which came into force at the beginning of this year, will give power to the London County Council to enforce many things which were left to the option of the builder or owner. The sanitary authority, under the 40th section, may make an examination of any house or building within their district, to find out the course of a drain, or to examine any closet, ashpit, water supply, trap, &c., and for this purpose they can, at all reasonable times by day, after 24 hours' notice to the occupier, enter on any premises and cause the ground to be opened in any place. Under the Metropolis Management Act, sect. 82, which this new provision reproduces, very little was ever done in this direction; tenants suffered in silence, or only complained of any nuisance or bad drainage to their landlords, who took their own view, and did as little as possible. We may now expect quite a revolution; owners and tenants are already busy in rectifying defects in the sanitary fittings and drainage of properties; traps and ventilators are being introduced, and new apparatus substituted. We may anticipate that the effect of these provisions will be to increase the cost of building—certainly to prevent the construction of imperfect drainage and the supply of inferior appliances and fittings. In this manner the plumbing trade will derive advantage, because unskilled labour will be abolished, and only competent hands be employed. By section 39, the County Council can make by-laws with respect to all sanitary fittings and conveniences, such as water-closets, ashpits, cesspools, receptacles for refuse, and the accessories thereof in connection with buildings constructed before or after the passing of the Act. The water supply of every house is one of the things which will be enforced by the sanitary authority, who have power to observe and enforce all by-laws.

Another provision will affect factories and workshops. Those erected before or after the passing of the Act are to be "provided with sufficient and suitable accommodation in the way of sanitary conveniences, regard being had to the number of persons employed in or in attendance at such building, and also where persons of both sexes are employed or in attendance, with proper separate accommodation for persons of each sex." This enactment will very materially affect the larger buildings in London which are occupied as factories and workshops, and we believe that the sanitary authorities are busy in putting the law into operation. The sanitary conveniences of many workshops in the Metropolis are disgracefully inadequate, or are allowed to get into such a state as to be practically unusable. In carrying out this section of the Act, sanitary authorities and architects engaged in carrying out new buildings will do wisely to adopt a more durable and cleanly form of latrine than has been used, such, for example, as the stoneware patent trough, in which kind of closet there is nothing to corrode or get out of order. These are made with partitions. An impetus will, no doubt, be given to manufactures which combine the utmost simplicity of action with durability and cleanliness. We have described and illustrated many excellent forms of sanitary fittings suitable for buildings of this class. Not only newly erected houses will be brought under the control of these sections of the Act, but all buildings that are about being rebuilt or have been pulled down to the ground-floor level. Schools as well as factories and workshops will be subject to these new regulations, which are of the greatest importance to all owners and occupiers.

BOOKS RECEIVED.

Transactions, R.I.B.A., Vol. VII. new series, is on our desk—an interesting volume containing a few good papers. Those on "Decorative Plaster Work," by E. E. Prior, M.A.; "Stucco Duro," by Mr. G. T. Robinson, F.S.A.; "A Ceiling in Gesso and Plaster," by Mr. Walter Crane, and the papers on "Sgraffito," by Mr. Heywood Sumner, are of interest. Other useful papers are those on painting, contributed to by Mr. J. M. Brydon, Mr. W. B. Richmond, A.R.A., Mr. N. H. T. Westlake, F.S.A. The illustrations comprise some interesting examples of decorative plaster-work from Toledo, Seville, illustrating the School of Bramante, and of wrought ironwork, by Mr. J. Starkie Gardner. An excellent portrait of the past president, Mr. Alfred Waterhouse, R.A., forms the frontispiece. —— *The Maintenanee of Macadamised Roads*, by Thomas Codrington, M.Inst.C.E., F.G.S., &c.; second edition, revised and enlarged (London: E. and F. N. Spon), is a new and revised edition of a book which every surveyor ought to possess. In consequence of the abolition of turnpike trusts some alteration was necessary, and the author has taken advantage of this to add new matter. The construction of roads; materials of various kinds, road coating and wear, measurement of traffic and wear, spreading materials, drainage, sweeping, and scraping, repairs, manual labour, and the proportion of expenditure on materials and labour, cost of maintenance, surveyors' duties and management, are subjects that are fully discussed. Mr. Codrington is a practical road surveyor, and his remarks and suggestions are worth consideration. ——*The Carpenters' and Builders' Complete Companion.* (London: Kegan Paul, Trench, Trübner, and Co., Limited; and New York.)—This is a large quarto volume, including treatises on the slide rule, construction of staircases and handrails, carpentry, painting, paper hanging, plastering, a system of estimating, &c., of more service to builders and carpenters in the United States than to English tradesmen.——*An Account of the Discovery of the Remains of Three Apses at Oxford Cathedral*, by James Park Harrison, M.A., Christchurch (London: Henry Frowde, Amen Corner), is an interesting description of the discovery of early apsal remains at the east end of Oxford Cathedral, first communicated to the Royal Archæological Institute. Mr. Harrison's little *brochure* is written to confirm the conclusions then made, which had been attacked by an antiquary. We think the author has made out a good case, and we commend his arguments and plans to the attention of antiquaries. The structural evidence relating to the buttress which masks the centre doorway and the arch in Lady-chapel appears overwhelming.——*Electric-Light Cables, and the Distribution of Electricity.* By Stuart A. Russell, Assoc.M.Inst.C.E. (London: Whittaker and Co.; George Bell and Co.)—Mr. Stuart A. Russell's volume makes a useful addition to the specialist's series. The author's work is mainly devoted to a description of the different systems of distribution and types of cable, in which he attempts to point out the durability of the insulating materials employed, and the relative advantages of different substances. From a careful examination of these conditions, the author gives the preference to copper, to soft copper if the conductor is not subjected to tensile strain, and to hard, drawn copper, or the best conducting quality of silicon bronze, if it is suspended overhead. In the last case the greatest conductivity and strength per unit of length is what is required. It must be remembered that electrical energy is converted into heat which is wasted, besides being detrimental to the insulating covering, and in some cases fusing the conductor. The resistance is accompanied by a fall of pressure, and therefore it is necessary to reduce the expenditure of energy as much as possible. The resistance of the conductors varies with the material, and is proportional to quotient of length by the sectional area. Cost is important also. These data are summarised in a table, and the author proceeds to discuss the conditions of economy in working, moderate rise of temperature, and moderate force of pressure. Each system of distribution is considered separately. The systems known as the "series system," "parallel system," combinations of these, "three wire," multiple wire systems, &c., are described, and the arrangements and grouping of lamps illustrated by diagrams. The forms of conductors and joints, insulating materials, indiarubber, guttapercha, Bitite, fibrous insulators, lead, &c., are explained. The author considers the objections to overhead lines, which are worth attention, and the construction of conduits for underground lines, which are of various materials. The volume will be found a useful textbook for the electrical engineer and managers of companies. ——*The Art and Craft of Cabinet Making*, by David Denning (London: Whittaker and Co.), is a practical handbook to the construction of cabinet furniture for amateurs and young cabinet-makers, and from a general glance over the various chapters, which treat of forms and uses of tools, the development of furniture, woods, glue, and screws, and the appliances, joints, and details, we think Mr. Denning's little book will be a welcome guide to all amateurs and apprentices. Veneering and brass work are specially treated, and the examples of construction given of various sideboards and cabinets, fancy tables, writing-table, bedroom furniture, wardrobes, washstands, pedestal cupboards, &c., are practical and useful. Every operation, the joints used, tenons, dowel-joints, rabbets, bevelled edge panels, stop chamfering, stopped beading, flutes, mouldings, &c., are separately explained and illustrated by clear diagrams. The remarks about sham "antique" furniture and the mistaken ideas prevalent of style are well worth perusal by all furniture buyers, who are often misled in thinking articles they have bought are Tudor, Stuart, Georgian, or Chippendale, when they are mere imitations, or pieces of furniture with features and peculiarities which are characteristic of a much later age.

Sir John Gorst opened on Tuesday the Conservative Club at St. Helen's, Lancs, which has been altered and redecorated at a cost of £2,000. Messrs. Waizbohm and Sons were the chief contractors, and the decorations were executed by Mr. R. McNelly.

The students from Wellington College will reassemble next week temporarily in various hotels at Malvern. Meantime active steps are being taken to carry out the whole of the recommendations of Dr. Bristowe and Mr. Rogers Field. These include the reconstruction of the gasfittings, the drains, and surface drainage. It is expected that the work will be completed before the commencement of the summer term.

William Foggin, builder, of Newcastle-on-Tyne, died on Wednesday week, aged 69 years. He carried out much of the Roman Catholic building work in the city and district. He built the Catholic Church of St. Andrew's, in Worswick-street, and also the Catholic schools at the Manors, the convent schools at Villa-place, the Presbytery at St. Mary's Cathedral, the Freemasons' Hall in Maple-street, the Catholic church dedicated to Our Lady and St. Oswin, at Tynemouth, opened about a couple of years ago, and a number of other public buildings in Newcastle and the district.

Building Intelligence.

Birmingham.—The new branch free library in Saltley-road is approaching completion. It is the largest branch yet built in the city, and is placed at the corner of Lingard-street and Saltley-road. The entrance is at the corner, and it gives access through a vestibule to the principal room, which extends the full length of the very narrow site. This single room, 82ft. long by 32ft. wide, is to be a lending library, a reference library, and a reading-room in one. The shorter frontage masks the librarian's room and a suite of cloak-rooms and lavatories. The large room has a coved roof of open timberwork, 19ft. from floor-line to springing. The floor is a noiseless one of wooden blocks laid upon concrete. It is lighted on one side by eight large three-light mullioned windows, and the opposite wall is broken up into arcades corresponding to the windows. The books of the lending library will be stored in open oak "presses" within the arcades. There is space here and in the librarian's private room for 10,320 volumes. A counter 58ft. long runs down the right-hand side of the hall in front of the presses. Externally over the vestibule there is a clock tower 10ft. square, with spire 72ft. in height—*i.e.*, 32ft. above the roof ridge; the clock has four dials. The walls are of Ruabon brick and terracotta, and the style is English Renaissance. A frieze and tympani over the windows and arcades are occupied by terracotta panels, modelled by Mr. B. Creswick, teacher of design at the Municipal School of Art. The design of the frieze is a conventionalised ornament suggested by the giant parsnip, and these contain sixteen figures illustrating the principal avocations pursued in the city. The tympani contain other subjects. The building has cost £4,000, and has been built by Messrs. W. and J. Welsh, from designs by Messrs. Cossins and Peacock.

Rearsby.—The parish church was reopened by the Bishop of Peterborough, Dr. Creighton, on Thursday, the 21st inst., after restoration carried out from plans by Messrs. R. J. and J. Goodacre. In 1860 the north wall of the church was rebuilt, new pews and a new pulpit put in, and an organ added, the amount then expended being exactly the same as now, namely, £1,400. In the present restoration the clerestory walls have had to be taken down, and on the north side the arcade and the piers have also been rebuilt from the foundation, the old masonry being again used. The nave is now covered in by a new oak roof resembling the one removed, and has a leaden surface. The chancel has been rebuilt, as have also the west wall of the north aisle, and a portion of the north wall. The aisle floors have been relaid with tiles by Messrs. E. Smith and Co., Coalville, and the pews have been restored and refixed with new oak kerbs and boarded floors. Mr. H. Cockram acted as clerk of the works, Mr. S. Cotton, of Rearsby, was the general contractor.

Westcombe Park.—On Saturday last the new church of St. George, Westcombe Park, was consecrated. The church is in the Early French style, and when completed with chancel, tower, and spire, will cost £10,000. The interior and exterior are faced with red bricks, relieved by Bath-stone dressings and strings, and the roof open-timbered. The floors are fireproof, and covered with wood block flooring. The church has been carried out from the designs of Messrs. Newman and Newman, F.R.I.B.A., architects, of 31, Tooley-street, and built by Messrs. Balaam Bros., of Shenton-street, Old Kent-road.

* * *

COMPETITIONS.

Blaina.—In the competition for the Blaina Reading Institute, the plans sent in by Mr. F. R. Bates, of Leicester-road, Newport, Mon., have been selected, and he has been appointed to carry out the work.

* * *

Alterations have been made to the offices of the London and Midland Bank, Cornhill, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air, and fresh air admitted by their improved air inlets.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Society of Architects.—A meeting of this society was held on Tuesday evening at St. James's Hall, Piccadilly, Mr. E. Tidman, F.S.I., treasurer, in the chair. Mr. William Howard Smith, city architect of Carlisle, was elected as a member. A paper on "Building Stones: their Structure and Origin" was read by Prof. J. Logan Lobley, F.G.S., of Liverpool, and is fully reported on p. 162. The lecture was illustrated by a "geological clock" (as the author termed a chronological table of sedimentary strata), and by numerous lantern views. At the close a hearty vote of thanks was accorded the lecturer, on the motion of Dr. C. Collingwood, seconded by Mr. F. J. Lewis.

Birmingham Architectural Association.—On January 19th a paper, entitled "Four Suffolk Churches," was read before the above society by Mr. Paul Waterhouse, A.R.I.B.A. The churches dealt with by the lecturer were those of Southwold, Blythborough, Covehithe, and Walberswick, of which the two latter are for the greater part in ruins. After apologising for bringing before his audience the architecture of so distant a part of England, Mr. Waterhouse proceeded to give an account of the churches in question, detailing something of their history, characteristics, and present state, and dwelling on the marked peculiarities which emphasise the church work of the particular period and locality represented by them. The lecture was illustrated by photographs and by sketches, mostly the work of the author, though some were by Mrs. Paul Waterhouse. In explanation of the building methods of the early 15th century, quotations were made from Gardner's "Dunwich" (a rare antiquarian work published in 1735), which preserved among other miscellaneous information on the buildings of the neighbourhood, a verbatim copy of the contract for building Walberswick Church, bearing date "the fourthe yeare of King Henry the Sexte." The lecturer pointed out as two prominent features of the procedure of the time, the absence of an architect and the explicit directions that the various details of the design were to be imitated from such points as were most admired in the then existing churches of the neighbourhood. Mr. Waterhouse dwelt on the terrible architectural results of the Cromwellian Iconoclastic fury, which was particularly savage in the eastern counties, and concluded his admirable paper with an imaginary picture of the glories which must have existed before the destruction of those days. In proposing a vote of thanks to Mr. Waterhouse for his able paper, Mr. W. H. Bidlake said that the country in which the churches described lay was one which, from its historic associations, and from the fact that it is a country which has, from being the seat of a wealthy commerce, become the scene of agricultural pursuits, appeals strongly to the imagination. The severe outlines of the churches of the eastern counties appeared to him particularly impressive, standing as they do, in the wide, flat lands of the district; and the churches have a great apparent stability, notwithstanding the weakness caused in appearance by the almost continuous clerestory windows. The vote of thanks was seconded by Mr. Doubleday, and supported by Mr. F. Barry Peacock (vice-president), Mr. W. Hawley Lloyd, and others, and was unanimously passed.

Leicester Master Builders' Association.—The first annual meeting of the members of this association was held at the Bull's Head Hotel, on Wednesday week. The president (Mr. D. Garrett) occupied the chair. The annual report stated the committee's opinion that, after conference with the trade societies, a fairly sound and workable code of rules had been made in all the branches, and they hoped that all alike will do their best to loyally carry them out. They had been now in use about nine months, and several other matters of great importance have been dealt with by the committee, such as the responsibilities of builders, who, although insured, were still liable to actions at common law, and the question of retendering for work after estimates are apparently accepted—both of which questions have been satisfactorily settled. The alterations to the existing forms of contract between architects and builders have not yet been finally agreed upon. The form of contract for sub-contractors issued by the committee is being generally adopted. Mr. Starkey moved, and Mr. Riddett seconded, the adoption of the report, which was agreed to. On the motion of Mr. Clarke, seconded by Mr. Tyers, the balance-sheet was adopted. Mr. D. Garrett was re-elected as president, Mr. G. Hewitt was reappointed as vice-president, Mr. F. Major was re-elected treasurer, and Mr. W. Yates was again appointed secretary. The following were appointed the committee for the ensuing year:—Messrs. H. Bland, A. Chambers, H. Herbert, J. O. Jewsbury, J. E. Johnson, J. H. Kellett, E. B. Pipes, G. Hardington, and J. Riddett.

Northern Architectural Association Students' Sketching Club.—The second annual social gathering and exhibition of sketches of the above club was held on Monday evening last, when 80 or 90 members and friends accepted the club's invitation. The exhibition included the work done by members at the fortnightly excursions, and Mr. C. Spooner kindly lent his Royal Academy Studentship drawings, which were greatly admired by those present. The president, Mr. W. S. Hicks, in opening the proceedings, congratulated the members on their work during the past year, which compliment was seconded in some remarks by Mr. Arch. Dunn. A programme of vocal and instrumental music was given by the members and their friends, including Mr. Arch. Dunn, jr., Mr. J. H. Beere, Mr. W. E. Fenwicke, Mr. B. Mulcaster, Mr. J. Cresswell, Mr. H. Oswald, Mr. Roland Rich, Capt. Macdonald, Mr. E. Connell, Mr. Fred Ridley, and C. S. Errington. Messrs. R. B. Dick and J. W. Boyd proposed votes of thanks to the artistes and the president for their services, the latter of whom received musical honours, and a most successful gathering was brought to a close by the singing of the National Anthem.

Nottingham Master Builders' Association.—The annual meeting of the Nottingham Master Builders' Association was held on Friday at the Mechanics' Institute, Mr. J. W. Woodsend presiding. After the general business had been disposed of and the officers elected for the ensuing year, notices from the bricklayers' and labourers' societies asking for an advance of wages and code of working rules were read and discussed. It was the unanimous opinion of the members that the present state of the building trade in Nottingham did not justify any advance on the present rate of wages.

Royal Cambrian Academy.—The annual general meeting of this academy was held on Saturday at Plas Mawr, Conway, Mr. Clarence Whaite, R.W.S., occupying the chair. The report showed that the academy had made great progress during the year, and that its financial position is satisfactory. Mr. Whaite was re-elected president, Mr. Edwin. A. Norbury vice-president, and Mr. W. L. Banks treasurer and secretary. Joseph Knight, R.I., was elected a full member, and the following were also elected to full membership from the list of associates:—Benjamin Fowler, B. Fisher, and J. Clinton Jones. The following were elected associates from a long list of candidates:—Arthur Baker, F.R.I.B.A. (the honorary architect of the academy), Robert Fowler, R.I., Harold Swanwick, and Chisolm Cole. The exhibition will open on the 6th of June and close on the 29th of October, and, so far, promises to be the most successful yet held in the Principality.

* * *

Under the will of Mr. John James Lowndes, late of 2, Chelsea-embankment, who died on the 2nd ult., a chalk drawing, by Dante Gabriel Rosetti, entitled "Triplex Rosa," has been bequeathed to the trustees of the National Gallery, and an onyx vase in a gilt silver setting, and a piece of old Italian needlework, set in a black frame, to the South Kensington Museum.

A new Wesleyan church, which has been erected at Swinton at a cost of nearly £7,000, will have its doors formally opened on Thursday by the Mayor of Salford. The building consists of a nave, chancel, choir vestry, minister's vestry, and morning chapel, the whole being crowned by a spire 120ft. high. The structure is Gothic in style, from the designs of Messrs. W. Waddington and Son, Burnley, the builders being Messrs. R. Rawlinson and Son, Swinton. This is the third chapel which has been erected on the present site.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. F. M.—C. S. and Co.—M. S. B.—Clyto.—E. and F. T. Co.—J. L. R. (Guildford).

"BUILDING NEWS" DESIGNING CLUB.

FOURTH LIST OF SUBJECTS.

D.—A dining-room chiffonier and chair in mahogany, suitable for an architect's house. The sideboard to be 5ft. long, and not more than 2ft. in the deepest part of the piece, which is to be 6ft. high. The lower part is to provide spacious cupboards for decanters, glass, &c In the centre of the main body, below the sideboard level, a good deep drawer is to be arranged, suitable for accommodating a tablecloth, &c. In the upper part accommodation is to be contrived for the display of small works of art in glazed cupboards. The style to be left to the competitor. Scale, 1in. to the foot. Plans of lower and upper part, two elevations, a section, and sketch.

Or E.—A pair of labourers' cottages, suitable for an exposed mountain district in a stone country. Each house to contain a porch, living room, 14ft. by 12ft., scullery about 10ft. by 12ft., pantry, woodhouse or wash-house, with copper in it, a coal-place, ash-place, and w.c. Upstairs, one large and two small bedrooms. Site is situated on the side of a hill, with a fall of 1 in 10. Walls stone, roof covered with stone slab slates. Convenience, economy, and picturesqueness to be considered. Scale, 6ft. to the inch. Two plans, three elevations, section, and sketch.

DRAWINGS OF HALL RECEIVED.—"Graham," "Pastime," "Peterborough," "Sanitas," "Sphinx," "Old Postage-Stamp," "Jamrach," "Symbol," "Sector." "Nil Nisi Bonum," "Vulcan," "Ich Dien," "La Cigale," "Excelsior," "Amor Patriæ."

Correspondence.

"ARCHITECTURE: AN ART, A SCIENCE, A PROFESSION, OR——?"

To the Editor of the BUILDING NEWS.

SIR,—The accompanying advertisement shows, at any rate, in what light the Wesleyan community at Blaina, Monmouthshire (and possibly their brethren throughout South Wales also), regard the profession of architecture!

TO ARCHITECTS.—Competitive Plans and Specifications required (free of charge) for New Wesleyan Chapel and Schools at Blaina, Mon. Sittings about 700; cost not to exceed £2,000. The Building Committee to select the design most suitable for the purpose, and the successful competitor to give his personal supervision in carrying out the work, on the usual trade terms. For further particulars apply to the Rev. Joseph Wells, Blaina, Mon. Plans to be delivered by February 2nd.

Here is a chance which no architect who looks upon himself as a tradesman should miss.—I am, &c.,

F. BALDWIN,
Hon. Sec. Cardiff Architects' Society.

Cardiff, Jan. 25.

RE LONDON SCHOOL BOARD v. JOHNSON.

SIR,—You doubtless have watched with great interest the progress of the above case, and, with many others, are pleased at the result.

A large number of persons are desirous of presenting Mr. Johnson with some public recognition of the courageous stand he has made against a great public body who have had at their command (and have used it) the purse of the ratepayers of London to persecute him with.

Mr. Johnson has greatly suffered in mind, as well as in bodily health, throughout the trying ordeal he has had to so cruelly undergo.

It will be remembered that the work which was in question had been completed for five years, and it speaks highly of Mr. Johnson's honesty of purpose that after the exhaustive inquiry of 24 days before the arbitrator he should be able to arrive at a decision which enabled the learned judge to give a verdict so satisfactory to the defendant. Yet, although the decision was so favourable to Mr. Johnson, he will unfortunately be the loser of a large sum of money by these unjustifiable proceedings, and having known him for a period of nearly twenty years as an upright man, I, at the request of numerous friends, have undertaken to obtain subscriptions on behalf of the above, and venture to ask the favour of your kind co-operation in this desirable object.—I am, &c.,

WILLIAM F. PENFOLD.

Auction and Estate Agency Office, High-street,
Upper Tooting, S.W., Jan 18.

P.S.—Cheques should be crossed "Johnson Fund, London and Westminster Bank, Southwark."

CHIPS.

Saturday in next week, the 6th of February, has been appointed for the private view of the Spring Exhibition of the 19th Century Art Society, at the Conduit-street Galleries.

A meeting was held in the Council-chamber of the Worcester Guildhall on Friday night, under the auspices of the Worcestershire Diocesan Architectural and Archæological Society, to consider the practibility of compiling a new history of Worcestershire. It was unanimously decided to proceed, and a committee was appointed, with Sir E. Lechmere as president.

A bust of the late Rev. Henry White, of the Savoy, will shortly be placed in the City Art Gallery at the Guildhall. The sculptor is Mr. J. R. Essex, Devonshire-street, Portman-square, and the original model of the bust appeared in the Royal Academy Exhibition last year.

A London correspondent states that Mr. Alfred Waterhouse, R.A., has lately received £40,000 under his brother's will, and Val Prinsep, A.R.A., who married the daughter of the late Mr. F. Leyland, has come into a third share of a million of money, left to Mrs. Val Prinsep by her father.

The public offices, Colwyn Bay, are being warmed and ventilated by means of Shorland's Patent Manchester Grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

In our description of Ralston House, Bromley, Kent, which appeared in our issue of the 15th inst., p. 90, it was stated that on the first floor were "dining-room and ball-room." This should have read "dressing-room and bath-room."

The Local Government Board has just issued three sets of model by-laws, to be adopted by sanitary authorities in the Metropolis, under the Public Health (London) Act, 1891. One series requires every cistern used to contain drinking-water to be emptied and cleansed every six months. Another requires water-closets to be properly supplied with water for flushing; and the third deals with the prevention of nuisances arising from offensive matters and from the keeping of animals.

By invitation of the Mayor of Luton the members of the corporation, together with the various officials, assembled in the council chamber on Wednesday week, to spend a social evening and to take leave of the borough engineer and surveyor, Mr. E. J. Lovegrove, who is on the point of leaving the town to take a similar post at Richmond. Mr. Lovegrove was presented with an address illuminated on vellum, framed and glazed.

Intercommunication.

QUESTIONS.

[10708.]—**Architect-Appraiser.**—I should be glad to know whether it is necessary for an architect to take out an appraiser's license (value £2) before he can make valuations of property? There seems to be some doubt on this question, and I should like to have the matter cleared up.—M. SEANOR.

REPLIES.

[10695.]—**Bricks and Brick Making Machines.**—There are plenty of hand-presses still in use in terracotta works for moulding bricks of an ornamental character. I append a list of makers of terracotta and brick machinery for use of "Currie":—W. Johnson, Awley-road, Leeds; P. Bowden, Notting Hill, London; Clayton, Howlett, and Venables, Harrow-road, London; John Whitehead and Co., Preston, Lancashire; Gill, Pullham, and Tuke, Leeds; Rowlands Bros., Bletchley; Messrs. Edge and Sons, Shifnal; W. H. Hughes and Co., Ruabon; Worten Bros., Coalville; Renshaw, Manchester.—F. W.

[10697.]—**Keeping Surface-Water out of Cesspool.**—Your brickwork, even if good, is a half-brick too thin, and your puddle evidently bad. If you can reduce your tank's capacity, I advise knocking off the cement, and lining it with "hygeian rock"—to do which, after coating the bottom, build a 4½in. brick and cement wall to sustain the composition vertically (the patentee will instruct you), and if the cavity is kept clean and well filled, the remedy is certain. Should your cesspool be covered, with only a manhole, the fumes will be unbearable; then well rough the cemented surface, and use at least 1¼in. of cement and clean sand, in equal proportions, instead of the rock. I have used both.—A. C. B.

[10700.]—**Traps.**—I sympathise with "G. B." in his reply on page 155, that a larger size of drain-trap than 4in. is advisable on a drain from water closets. I would prefer either 5in. or—where it is wished to have a small surface of water on the house side or well of the trap—a 6in. trap, with the surface of the water in the well about 4¾in. diameter. This style is largely used by the Sanitary Protection Association of Edinburgh. I omitted to mention in my reply on page 155 that in some cases the cause of a trap not working freely might be that the drain-pipe beyond the trap, if air-tight, was air-locked for want of ventilation or some means for allowing escape of air out of the drain-pipe. This implies either that the mouth or outlet end of the pipe is below the water, or that an unknown trap exists beyond the known one, &c.—W. P. BUCHAN.

[10700.]—**Traps.**—You say, "Although the closet flushes 4 gallons at a time, the force of the water when it reaches the trap is not sufficient to clear the paper and soil out." You may apply an immediate remedy by sending for a "Quick-Motion Trap" (6in.) from the works of Messrs. Wm. Ingham and Sons, of Wortley, near Leeds, the makers of these traps. All drain traps with round tops have the same defect as is mentioned in the question.—Q. M.

[10702.]—**Bookkeeping.**—I have a good and simple system for contractors and builders, worked sheets of which I can supply. If "Pictor" will write to me, I think a modification of or the same system would suit.—F. J. W., Eastbourne House, Argyle-street, Ryde, I.W.

[10703.]—**Deal Floors on Concrete.**—I laid some flooring in this manner five years ago. The coke-breeze concrete (2in. thick) on 4in. of ordinary Portland-cement concrete, was left for a month to get thoroughly dry before the floor-boards were nailed down. I saw this flooring about a month ago; it has stood perfectly, and is as solid to walk upon as on the day it was laid. The boards were not, and ought not to be, tongued.—C. F. M.

[10703.]—**Deal Floors on Concrete.**—I have practised this system these eight or ten years, and it answers well. The boards are liable to "cockle," and certain to quickly decay, if the concrete beneath is not perfectly dry. The plan I find answer best is to put in the usual 3in. or 4in. in thickness or more of concrete, as may be required, as early as possible, to give time for drying. There is no harm done by walking or working upon the concrete, if of good quality, when it has quite consolidated. When dry, lay 1¼in. or 1½in. in thickness of coke-breeze concrete, or in place of coke, crushed soft-brick rubbish, if free from mortar and screened through a ½in. sieve, does equally as well. Float the same to a true and smooth surface, and allow it to remain a month, if possible, before nailing the boards thereto, to insure the concrete not retaining any moisture; ¾in. flooring cut down the middle, to make 3½in. by ⅝in. about, and not tongued, which I consider harmful, is the kind of covering board I like, and 2in. cut floor brads I find the best to retain a firm hold of the concrete. The success of a floor of this kind depends largely upon the concrete retaining no moisture at the time the boards are laid. One caution is necessary, not to cover the floor with linoleum, kamptulicon, or canvas; the atmosphere being excluded on both sides, dry-rot is almost certain to result.—THOMAS POTTER, Alresford, Hants.

[10705.]—**Ventilation of Stables.**—I should admit the fresh air 2ft. 6in. above top of manger and 5ft. from floor on the other side of stable. It is not necessary to take the air-inlet grating near to ground. An elbow, as shown at C in your correspondent's sketch, is quite sufficient.—C. F. M.

[10707.]—**Fan-Vaulting in Brick.**—"Bricky" can see an example of modern fan-vaulting in brick in the subway connecting the Crystal Palace with the Crystal Palace Railway Station, Sydenham. Its cost of execution would depend very much upon the quantity to be done. So little of this kind of work is done, that it would be difficult to value it beforehand. Surveyors and estimaters generally undervalue such work. We should be inclined to say, as a safe price, from 5s. to 6s. a foot super., cut and set, including bricks.—F. W.

◆

Cardinal Manning has bequeathed a portrait of his father to the National Portrait Gallery.

Legal.

OWNERS AND DRAINS.

DRAINS in old houses especially are becoming a very serious subject for the owners of such property. At common law a landlord is safe enough, as he cannot be compelled to do or pay for any repairs or drainage whatever, even though it was required to render the house fit for habitation. Leases generally are so drawn that all this falls upon the lessee. But, even when this is not so, the lessor cannot be made liable except under his express covenant for that purpose. When, therefore, the drains of an ordinary house get out of order it will usually be found that if held under a lease the burden falls on the lessee by reason of his stringent covenant to repair; and, at all events, it will not have to be borne by the owner unless he has expressly agreed to do such work. But, owing to the numerous statutes that have been passed of late years affecting the sanitary state of dwellings from a public point of view, the rights of lessor and lessee no longer depend solely upon the lease; nor are their liabilities entirely governed by the common law. If a sanitary authority has ordered drainage work to be done, then this order will be against the owner; and even though the occupier or tenant does the work, he will be able to recover the cost from his landlord.

This position was well exemplified by what happened in the recent case of "Spencer v. Watson" (reported elsewhere), heard on Jan. 19, in the Marylebone County Court, before Judge Stonor. There the plaintiff, as tenant of a house, found the drains out of order, and called in a builder, who said they must be connected with the main drain; and for this he applied to the Vestry, and on May 4 last year it was done. The builder then went on with the work, and on May 8, at his suggestion, an order was obtained from the Marylebone Vestry calling upon the defendant as owner, under the Metropolis Management Act and the Nuisances Removal Act, 1855, to do all the works in question, including what had been already done. The defendant declined, and said that under his lease the plaintiff should do it; though this was since admitted to be a mistake, as there was no such covenant. The plaintiff now sued for the cost of all the works, two-thirds of which were done before the order of the Vestry. The Judge held that the defendant could not be liable for this earlier work, but decided that he was bound to pay the cost of what had been done by the plaintiff since the date of the order, on the ground that there was a statutory duty cast upon him as owner to do such drainage works; and as the plaintiff had been bound to do it under penalties he could recover the expenses. So the plaintiff gets one-third of his outlay, and would have had it all had he obtained the order from the Vestry before beginning.

Fred Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Tecton.—Sub-Contract.—Condition.—This is more a question of fact than of law. Unfortunately the subcontract was verbal, so that what was really agreed upon is matter of personal evidence. If the sub-contractor agreed to wait the three months for the 20 per cent. balance, then, of course, he cannot claim payment earlier. But if he denies this, and sues, then the judge or jury must decide.

Ch. H.—Contract.—Schedule of Prices.—In the absence of the schedule of prices, which the contractor should have supplied before beginning the work, but which you cannot now accept as applying to deviations from the contract, you must as architect measure up and value extra works in question according to the prices current at the time it was done, and if the contract is properly drawn, your decision should be final and binding on the contractor, who is himself in default.

M.—Right of Light.—Grant.—By your conveyance of this plot of land, you were, in fact and in law, granted a right of light to the extent you name, and the purchaser of the adjoining land from your vendor bought subject to this reservation. I think you are quite right, and that you would succeed in an action if necessary.

◆

At the meeting of St. Paul's Ecclesiological Society held on Wednesday evening at St. Paul's Chapter-house, E.C., Mr. J. T. Micklethwaite, F.S.A., read a paper on "The Growth of a Parish Church," illustrated by numerous plans and sections.

LEGAL INTELLIGENCE.

Compensation for Insanitary Property.—An important decision in regard to the principles on which compensation should be awarded for property which has been condemned as insanitary was given by the Queen's Bench Court on Friday, in the case of "Gough v. the Mayor and Corporation of Liverpool." Pursuant to local Acts of 1864 and 1879, a grand jury had condemned certain houses in Liverpool belonging to the plaintiff, and Mr. Hunter Rodwell, Q.C., was appointed arbitrator to fix the amount of compensation. At the first hearing he awarded the plaintiff £300, on the principle that the finding of the grand jury that the dwellings were unfit for human habitation was conclusive and must be taken into consideration, and he, therefore, assessed the damages merely on the value of the site and building materials. Upon a special case, however, stated by the arbitrator, a Divisional Court held that the claimant was entitled to the market value of the property as producing rent, and fixed the compensation at £667. Upon appeal by the corporation, the Court of Appeal agreed that the proper principle was the rent-producing value at the time, but varied the judgment of the Divisional Court by sending the matter back to the arbitrator, on the ground that, as the question had come before them in the form of a special case, the Court had no power to fix the amount of award. At the second hearing the arbitrator, although the surveyor for the corporation fixed the amount, according to the principle laid down, at £667, only awarded £468, and stated no reasons for so doing. Upon appeal, he has been upheld, the Court deciding that though an arbitrator is bound to take the rent-producing value of the property at the time as the basis of his award, he may, if he think fit, deduct from the amount thus arrived at what he considers just on account of the condition, probable duration, and state of repair of the buildings, included in which would be the insanitary nature of the property.

In re J. Trist.—At the Portsmouth Bankruptcy Court on Tuesday week, John Trist, of Chetwynd-road, Southsea, builders' merchant, trading as John Trist and Co., came up for his public examination. The statement of affairs showed liabilities of £1,006 2s. 3d., and a deficiency of £746 19s. 1d. Debtor said he commenced business in 1880, and had previously been a Unitarian minister. He commenced business at Southampton, engaging in the coal trade. He remained in Southampton for seven years. In 1884-5 he had a number of bad debts, and with a desire of doing better he transferred his business to Portsmouth. He had supplied materials to speculative builders (some of whom were now bankrupt), and had taken over and finished some houses at North End. The debtor was allowed to pass.

Employers' Liability.—Brannigan v. Robinson.—Queen's Bench Division, Jan. 20 (before Mr. Justice Lawrance and Mr. Justice Wright).—The plaintiff was a labouring man, and had been in the employment of the defendant, who at the time had in hand the building of a new theatre at Ashton-under-Lyne. As a preliminary operation some buildings which occupied the site had to be removed. While the plaintiff was at work the brickwork of a gable fell upon him and hurt him seriously. He thereupon brought an action in the Ashton County Court for damages under the Employers' Liability Act, and he recovered a verdict of £178. This decision was now appealed against, and it was submitted that the defendant was not liable under that statute. Mr. Justice Lawrance, upon the conclusion of the argument, expressed his opinion that the County Court judge was right. In his judgment a workman was as much entitled to succeed where the negligence was that of the employer himself, as where it was that of a person who was in the service of the employer. Mr. Justice Wright had come to the same conclusion, but with much hesitation and doubt. The statute, in his opinion, applied as much to the insecurity of a wall which was being pulled down as to the insecurity of a wall which was being built up. The appeal was dismissed with costs, but it was intimated that the question involved was one of importance and novelty, and arrangements were made for a further appeal.

Landlords, Tenants, and Drains.—At the Marylebone County Court on Tuesday week, Judge Stonor decided a case which bears upon the liability for the repair or renewal of defective house drains in London. It was an action by Messrs. Spencer, Turner, and Boldero for £38, which they had paid in getting certain works done to the drains of 9, Alpha-road, in compliance with an order of the Marylebone Vestry. The defendant, Mr. Watson, was the landlord of the house, which the plaintiffs held from him under lease. In the spring of 1891 the drains got out of order, and the plaintiffs instructed a builder to examine them and put them in order. The renovation of the drains was carried out by the builder, under the direction, and with the approval, of the vestry. On May 3, the vestry, on the representation of the builder, made an order under the Metropolis Management Act, 1855, on the owner (the defendant, Mr. Watson) to do all the works in question, including that which was already done. The defendant declined to do the work, on the ground that the plaintiffs were bound by their lease to do it themselves. It was now admitted that the lease contained no such provision. The plaintiffs thereupon completed the work, and now sought to recover the amount expended from the defendant, their landlord, it being admitted on their behalf that about two-thirds of the sum claimed was in respect of work done before the date of the order of the vestry. In giving judgment, his Honour said it was quite clear that at common law the defendant was under no liability to repair the drains or to refund to the plaintiffs money expended by them in doing so; and the question was whether the defendant was under any such liability under the Metropolis Management Act of 1855. In any case, under the vestry order he was not liable for work done previous to the notice of the order and his refusal to comply with it. But the judge held that he was liable for the work done subsequently, on the authority of "Castleberg *v.* Kenyon," decided in the Queen's Bench Division in June, 1879. His Honour, therefore, gave judgment for the plaintiffs for one-third of the whole expense of the works, which, by consent, was taken at £12 12s., with costs.

Public Carriageways on New Estates.—The London County Council v. Edmondson and Company.—(Appeal Court, Jan. 26, before Justices Lawrance and Wright).—The question in this appeal was whether the construction placed by Mr. Haden Corser, the police magistrate, upon the 35th section of the London County Council (General Powers) Act of 1890 was correct. The original hearing and decision were reported and commented upon in the Building News for Sept. 18, 1891, p. 391, last vol. The respondents owned an estate at Islington which was being laid out for building. On one side of the estate was Aberdeen-road, and on the other Highbury New Park, both carriageways. There was a narrow way, which ran from one thoroughfare to the other, and the respondents gave notice of their intention to widen this way, and they did widen some 350ft. of it, but there was no evidence that they intended to widen it the whole way, and if this were not done the widened road would not directly communicate with a carriageway at each end. The section said that no road, passage, or way which should not directly communicate at both ends with a public carriageway should be formed into a public carriageway without the consent of the Council, who might impose conditions. The Council objected to what the respondents proposed, and summoned them, but the magistrate said that the Council should show that it was not ultimately intended that the widened way would not communicate at both ends with a public carriageway. This it was submitted to their lordships that the Council were not bound to do. On the other side it was said that the Council sought to impose upon the respondents a condition that they should widen a part of a road which was not upon their own land.—The Court, after a long argument, said that the principal question seemed to be whether the Council had a right to require that there should be a road across from one carriage way to the other, or whether it would be a sufficient compliance with the Act that the road should start from one carriageway and return to another instead of proceeding straight. They thought that this state of things would be a sufficient compliance with the Act. Otherwise, on many estates it would never be possible to make roads without going over other people's property.—The appeal was dismissed with costs.

A Clerk of Works' Action for Libel.—At the Sunbury Petty Sessions on Monday, William Batchelor, of Railway-road, Teddington, was summoned by Thomas Morris, of 4, Vicarage-road, Teddington, for unlawfully and maliciously publishing a certain false, wicked, scandalous, and defamatory libel, on December 3, and he was further summoned for a similar offence on December 16. The proceedings arose out of certain matters connected with the sewerage scheme of the Teddington Local Board. For plaintiff it was stated that Mr. Morris was clerk of the sewerage works at Teddington, and the defendant had formerly been in the employ of the local board, but was discharged. On the 3rd December defendant wrote to Mr. Frampton, the chairman of the local board, the following letter:—"Sir,—Having received certain information concerning the sewerage works which I have every reason to believe, I am advised to lay it before the board. (1) I am informed that since Mr. Acock left the sewage farm, Mr. Morris, clerk of works for the board, has been acting on behalf of the contractors, Mr. King having told the workmen they were to go to Mr. Morris for their orders. (2) That this was with the consent of Mr. York, the board's surveyor. (3) That during the time Mr. Morris has been acting as the clerk of the works for the board, and also on behalf of the contractors, certain parts of the work have been scamped, with his knowledge, and to his orders. Sir, I am able to inform the board of one place in particular where the work has been scamped to a serious extent, which, according to my informant, is sufficient evidence to prove the character of the man they have had to represent them." This was the libel published on Dec. 3. The libel of the 16th of Dec. consisted of a letter published in a local paper, and containing the same charges against the complainant. Mr. Frampton deposed that the defendant called upon him on the 3rd of December, and handed him a letter, which he asked him to lay before the local board. The witness told him he would not do so, as it contained statements of a libellous character, whereupon the defendant said he would bring it before the ratepayers in some other way. Cross-examined: The witness admitted that the local board had been engaged in sewerage operations for some time, and that the scheme had turned out to be unsatisfactory. He would not admit, however, that it had broken down altogether. How do you account for the failure of the drainage scheme in Teddington?—I don't think that has anything to do with me. Have not the sewers been opened by the board?—Yes, to repair leakages. And arising from the contractors' faulty construction?—Yes. And has not the consulting engineer reported to you that the whole of the work of the contractors was perfunctory and incomplete?—He reported that it was incomplete. Defendant was committed for trial on the first charge, bail being allowed, and the second was dismissed.

RUINOUS PREMISES.—At Torquay, on the 4th inst., Colonel A. P. Keating, Teignmouth, was summoned by the Marychurch Local Board for neglecting to comply with a notice from Mr. D. Bowden, surveyor, to take down or secure a building at Barton, which was in a ruinous state and dangerous to passengers and occupiers of neighbouring buildings. Mr. Grant Wollen, who represented the Local Board, said in February, 1890, the surveyor reported that the buildings were in a dangerous condition, and in the following December notice was served on Colonel Keating to take down the house. This, however, was not done, although further letters were written; but in the meantime the Board had a hoarding erected in front of the dangerous building at a cost of £3 12s. 6d.; and he now asked for an order that the building be taken down. The defence was that the property belonged to trustees. The Bench made an order for the payment of £3 12s. 6d., the cost of the hoarding, and 12s. costs, and ordered the dangerous building to be taken down within three days.

COMPENSATION FOR SUBSIDENCE OF A CHAPEL.—Mr. Royle, of Manchester, the arbitrator in the dispute between the trustees of the St. Stephen's Congregational Church, Milnrow, and the Local Board, has just made his award. The trustees claimed £500 for damages done to the chapel by the subsidence of earth consequent on sewerage works on the highway adjoining. The Local Board offered £150, the offer, however, to be withdrawn if not accepted within twenty-four hours. The case came on at Liverpool Assizes, but the hearing was stopped by the judge, Mr. Justice Wright, who suggested a friendly arbitration, Mr. Royle being appointed arbitrator. Having investigated the case and heard witnesses and the speeches of counsel, he now awards the trustees £364 as damages, the board to pay all costs.

EMPLOYERS' LIABILITY.—At the Leicester county court on the 13th inst., George White, labourer, sued Messrs. F. Major and Son, builders, Leicester, for £50 for injuries alleged to have been sustained while in the defendants' employ, and in consequence of negligence on the part of one of the partners of the defendant firm, who was directing the work plaintiff was doing. This action was heard at the December court, but the jury were unable to agree on their verdict, and were discharged. The evidence for plaintiff was that he was engaged with others to pull down a building in Milton-street, Leicester. White noticed that one of the walls was unsafe, and was about to push it down, when Mr. Arthur Major stopped him. The wall afterwards fell on plaintiff, and he was injured. The defence was that Mr. Major did not know the wall was unsafe, that it would not have fallen but for a heavy gust of wind, and, further, that just previous to the accident the plaintiff and two men had been called away to do other work, but that plaintiff did not go. The jury found for the plaintiff, £25, and judgement was entered accordingly.

IN RE JAMES GREENWOOD.—A sitting for public examination was held last week before Mr. Registrar Hope, under the failure of James Greenwood, builder and contractor, 80, Cannon-street, City, and Maltby-street, Bermondsey. The receiving order was made on November 4th last, the liabilities being returned in the statement of affairs at £12,330, of which £5,541 are unsecured, with an estimated suplus in assests of £7,136. The debtor commenced business about 26 years ago in partnership with his father and brother. His father retired from the firm in 1877, and the partnership with his brother was dissolved in September, 1889, and the debtor afterwards traded alone under the style of James Greenwood and Son. At the time of the dissolution he had a large amount of capital, and he attributed his failure to having taken over expensive machinery and premises, and to losses on the trading and on contracts. He stated that he accounted for the latter by having taken contracts at too low a price. The estimates were usually prepared by himself. In some cases he accepted contracts on low terms in order to keep the machinery moving. His loss on the trading was returned at £7,000 during the short space of two years. He was examined with reference to the circumstances attendant on the execution in November, 1889, of a post-nuptial settlement, by which he assigned properties at Sutton and elsewhere to trustees for the benefit of his wife, and stated that he was perfectly solvent at the time. The debtor passed his examination.

ADVERTISING HOARDINGS AND THE BUILDING ACT.—At Bow-street, on Tuesday, before Mr. Vaughan, the Partington Advertising Company appeared to a summons taken out at the instance of the London County Council, for unlawfully erecting a wooden structure, or erection of a removable or temporary character, on a piece of waste ground on the south side of Parliament-street, without the license of the Council under 45 Victoria, sec. 13, cap. 14, and 51 and 52 Victoria, cap. 41. Mr. Lawriston, a surveyor under the London County Council, described the hoarding as being 54ft. long and 18ft. high, and held in position by scaffold poles. Cross-examined, he said that he believed that a hoarding had been up there for several years, but that it was blown down in September last. Mr. Haddon Chambers, for the defence, contended, firstly, that the hoarding had been in existence for several years, and that, according to the Act, notice must have been given within six months of its erection. Mr. Vaughan thought that this was a new hoarding. Mr. Chambers still contended that putting up a hoarding after it had been blown down did not make it a new hoarding. His second point was that the hoarding was on ground specially exempted from the control of the London County Council under the Act. It was ground belonging to the Receiver of Police, an official appointed under the Crown, and was therefore Crown Land, and, as such, exempted from the operation of the Act. Evidence was called in support of this contention. Mr. Vaughan suggested that if the summons were adjourned, the Council would probably make no objection to granting a license for the hoarding. Mr. Burton, on behalf of the County Council, remarked that the hoarding would have to be reduced in height, and that it projected beyond the street frontage. Mr. Chambers thought that to apply for a license would be to make a surrender of his position that on Crown land no license was needed for the hoarding. Mr. Vaughan adjourned the summons.

THEATRES ON PIERS.—The company which owns the pier at Llandudno proposed to construct a theatre at the shore end of the pier, and submitted plans to the Improvement Commissioners, who refused to consider them, on the ground that a structure in such a position would injuriously affect the Promenade. The Pier Company applied for a mandamus against the Commissioners, but on Wednesday Justices Lawrance and Wright held that the company had no power to construct the theatre, and the rule for a mandamus was discharged.

THE ASSAULT ON A SURVEYOR.—THE QUEEN v. JUSTICES OF ESSEX.—(Before Justices Hawkins and Willis.)—On Wednesday a rule was moved for, calling upon the Justices of Essex to show cause why a writ of mandamus should not issue to compel the Justices to hear an appeal on behalf of William Stark, a builder and contractor of East Ham, who had been sentenced to 14 days' imprisonment without the option of a fine, for assaulting Mr. W. H. Savage, the surveyor of the East Ham Local Board. The Court granted a rule nisi.

THE BATTERSEA FIRE.—The adjourned inquiry into the death of the two girls, resulting from a fire at a draper's shop on Battersea Rise, was resumed yesterday (Thursday) before Mr. Braxton Hicks, at the Battersea vestry-hall. Mr. Barnard, the solicitor who is watching the case for Mr. Hardcastle, said the premises had been viewed by two district surveyors, who were prepared to give evidence if required. The coroner said he did not think it would be necessary to call upon them that day, as he was going to take the evidence of the shop-girls as far as possible. Ada Pearce, who was getting the grass from the window in 309 when it caught fire, said she had plenty of time to warn the other employées, and go upstairs and into the other shop, No. 307, before the fire became dangerous. Jane Lock, who lived in the house, said the Sun Insurance Company would not insure her things because of the unprotected state of the lights in the window of the shop. Other witnesses were called, who were in the house at the time of the fire, and the inquest was adjourned until next Thursday.

WATER SUPPLY AND SANITARY MATTERS.

ACCRINGTON.—Colonel Walter Mardon Ducat, R.E., held a Local Government Board inquiry at the town-hall, Accrington, a few days since, concerning the corporation's application to borrow £12,740 for works of sewerage, street improvements, new stables, and public lighting. The plans and estimates were prepared by the borough engineer, Mr. William J. Newton, Assoc.M.I.C.E. There was no opposition. Col. Ducat inspected the districts where the various works are to be carried out, also the new stables and abattoirs, and expresed himself as well pleased with the sanitary arrangement, the planning, and the substantial character of the buildings, and the work throughout.

THE COATHAM WATER SUPPLY.—The award of the arbitrator in the recent case of the Kirkleatham Local Board and the Stockton and Middlesbrough Water Board was received at Middlesbrough on Friday, and fixes the amount to be paid by the local board for mains, pipes, fittings, &c., at £25,424, each party to pay their own costs and half the costs of the award.

CRANLEIGH SEWAGE PURIFICATION.—A Local Government Board inquiry was held on the 14th inst. before Mr. T. Codrington, C.E., to consider the application of the Hambledon Rural Sanitary Authority for a loan to carry out works of sewage disposal for the parish of Cranleigh, the treatment of the sewage on land having proved an expensive failure. Mr. C. Nicholson Lailey, C.E., of 16, Great George-street, Westminster, who had prepared the scheme, explained that the method of disposing of the sewage was that known as the international system, by which the sewage was first treated in tanks and then passed through polarite filter beds, now rapidly coming into general use. There was no opposition to the scheme, which was considered highly satisfactory.

THE ARTESIAN WELL IN THE CITY.—The experiment of sinking the artesian well for the supply of the artisans' dwellings recently built by the City Commissioners of Sewers in the Minories has proved a success. The supply from the well yields 100,000 gallons a day of water, which, according to the analyses of Dr. Sedgwick Saunders, is of the purest quality. Col. William Haywood, the engineer to the Commissioners of Sewers, under whose direction the works have been carried out, has reported that the cost of sinking the well has been £3,500, and the expense of laying the requisite mains and pipes to connect it with the artisans' dwellings will be £1,690. When this has been done, the annual cost of pumping the water will be £140. The cost of the present water supply to the dwellings is £81 per year; but the supply is five times the quantity required for the dwellings, and the surplus 80,000 gallons a day could be utilised. The Commissioners decided on Tuesday to proceed to laying the water on to the dwellings.

THE SHIPLEY LOCAL BOARD AND BACK-TO-BACK HOUSES.—Although the by-laws of the Shipley local board prohibit the erection of back-to-back houses, the clause to that effect has been practically a dead letter, and the type of house has been accepted by the approval of plans in many instances. This fact was especially referred to by representatives of the West Riding County Council at the inquiry into the application by the Shipley and Windhill local boards for the amalgamation of the two districts, and undertakings were given that the practice should be discountenanced. Afterwards plans were submitted to the Shipley local board proposing the erection of blocks of back-to-back houses. One lot were allowed, to complete a row, but the other plans showing two new blocks of four were referred back. These plans were again considered, and then the matter was deferred until the new Shipley local board took office. The result was that, in spite of protests, the plans were approved by a majority. The action has not passed unnoticed by the County Council. The sanitary committee has made a report, and has directed a communication to be addressed to the local board pointing out the illegality of the approval, and threatening that unless the illegal approval is withdrawn the whole matter will be brought before the notice of the Local Government Board.

STAINED GLASS.

KILLINGHALL CHURCH, HARROGATE.—Stained glass has been inserted into two of the south-aisle windows by Mrs. Cautley—one window being in memory of her mother and the other of her late husband, Dr. Cautley. The first window represents the Resurrection and the Ascension of our Lord. The window to the memory of Dr. Cautley illustrates the text, "And they brought unto Him all sick people that were taken with divers diseases, and He healed them," and shows the Saviour employed in healing the sick, the lame, and others. These windows have been designed and executed by Messrs. Powell Bros., of 30, Park-square, Leeds.

Our Office Table.

WE are glad to see that at length the qualities of Mr. Thomas Graham Jackson's work as a draughtsman and architect have been appreciated by the members of the Royal Academy, as testified by his election on Wednesday night as one of the three new associates of that body, and all, however widely many differ from Mr. Jackson's views on architectural examination, federation, and registration, will unite in congratulating him on the tardy honour accorded him. The *Daily News*, in commenting on the elections, falls into an amusing error in classifying the architect of the New Examination School and for most of the modern college work at Oxford, with Messrs. Forbes and Bates as a "very young man." A portrait and biography of Mr. Jackson appeared in our issue of Feb. 7, 1890. The other two fresh A.R.A.'s are Mr. Stanhope A. Forbes, the *genre* painter, whose Salvation Army picture of last year ("Soldiers and Sailors") and his "By Order of the Court," an auction sale in a poorly furnished cottage, were popular features of the last two Academy shows; and Mr. Harry Bates, whose altar-piece for the late J. D. Sedding's church in Sloane-square, figure of "Socrates," and group of "Hounds in Leash," are works of undoubted merit and vigour.

IT is evident that the Glasgow Corporation will have to encounter serious opposition to their Building Regulations Bill next session. The builders object to it; its phraseology has been smartly criticised by local lawyers, and on Wednesday, at a representative meeting of Glasgow merchants and warehouse proprietors, it was unanimously resolved "That the Glasgow Building Regulations Bill is unreasonable in its terms, and is uncalled for in the interests of the community; and that the Bill, if passed into law, would interfere with the due development and proper utilisation of property, and would thereby hamper the conduct of business, and unnecessarily increase the rents of warehouses, shops, and dwellings." A committee was appointed to wait upon the Police Commissioners with a view to inducing them to abandon the Bill, and, failing that, to petition against it. Arrangements were also made for raising funds to oppose the Bill in Parliament.

THE City Council of Glasgow discussed at great length, at their last meeting, the question of appointing a manager for the supervision of the Improvement Trust property. It was stated that the Trust owns 1,000 dwelling-houses, 300 or 400 of which are under £5 a year rent. The Trust possess houses, to speak of which as disgraceful would be quite inadequate. This was attributed by a member to the ignorance of the trustees regarding the condition of their property. The net return from rental is £16,000; but to raise this there is an expenditure of £6,400, or, adding the unlet property, which amounts to £2,132, of £8,500, being more than 50 per cent. of the entire net revenue. It was asserted that the Trust owned property in which it was a wonder human beings could live. On a division, the motion to appoint a manager was carried by 29 to 22.

THE best pavement for city traffic, according to Mr. Samuel, C.E., in an address recently given to the Engineers' Club of Philadelphia, is one with an 18in. concrete foundation, overlaid with a 2in. plank flooring, thoroughly covered with asphalte on both sides, and, on top of these, cedar blocks set on end, with ½in. joints filled with beach pebbles and asphalte. It gives a sure footing for horses, is comparatively noiseless, and easily kept clean, and can be repaired in places without interrupting traffic or breaking up the rest of the street.

M. E. BARTET, a French expert, has just reported as to the best time to cut oak, elm, and beech underwood. When it is done in the middle of March or April, nearly all the shoots of the oak or elm are made before the end of June; but if the cutting is deferred until the end of August it is only in the spring of the following year that these make their first growth. The more the cutting is delayed beyond May, the more the shooting is retarted, and the proportion therefore increased of shoots in the second year. The beech is slower in putting out growth than the oak or the elm, and it is sufficiently early to cut the beech in the middle of August, so as to render them incapable of shooting until the following year. The time of cutting seems to have little effect on the proportion of stumps which put forth shoots, and those which are reduced to sterility obtain their maximum proportions in oaks and beech when cut between May and July. The elm shows the least sterility from cutting, the oak occupying the middle place between the elm and the beech. In the elm, the number of fertile stumps changes very little with the time of cutting; for the oak, August appears the only time unfavourable. The time of cutting does not exercise a marked influence on the average number of shoots from the fertile stumps of oak and elm, but with the beech the differences are very great.

◆

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Annual Meeting, St. Paul's Chapter House. 2.30 p.m.

MONDAY.—Society of Engineers. Westminster Town Hall. 7 p.m.
Surveyors' Institution. Discussion on "The Four Course System." 8 p.m.
Leeds and Yorkshire Architectural Society. "Spanish Architecture," by F. W. Bedford, A.R.I.B.A.

TUESDAY.—Institution of Civil Engineers. "Gold Quartz Reduction," by A. Harper Curtis. 8 p.m.
Glasgow Architectural Association. "The Architecture of the Human Figure," by Francis H. Newbery. 8 p.m.

WEDNESDAY.—Civil and Mechanical Engineers' Society. "Main Drainage Extension in Towns," by J. F. Reade. Westminster Palace Hotel. 7 p.m.
Society of Arts. "Dust, and How to Shut it Out," by T. Pridgin Teale. 8 p.m.
Carpenters' Hall Free Lectures. "Drainage of Buildings and Construction of Sewers," by Professor H. Robinson. 8 p.m.

FRIDAY.—Architectural Association. "Suggestive Domestic Work seen in past A.A. Excursions," with lantern illustrations, by Maurice B. Adams, F.R.I.B.A. 7.30 p.m.
Society of Arts. Howard Lecture No. 1, "The Development and Transmission of Power from Central Stations," by Professor W. Cawthorne Unwin, F.R.S. 8 p.m.
Royal Institution. "Metals at High Temperatures," by Professor Roberts Austen, C.B., F.R.S. 9 p.m.

◆

Architectural Association, 9, Conduit-street, W.—NOTE.—The date of the Sixth Ordinary General Meeting, given in last week's advertisement, should have been January 29th, instead of February 29th. February 5th, the Seventh Ordinary General Meeting at 7.30 p.m. Paper by Maurice B. Adams, Esq., F.R.I.B.A., on "Suggestive Domestic Work seen on past A.A. Excursions," with lantern illustrations.

SESSION 1892-93.—Students proposing to join the Association with a view to taking up the Courses of Instruction at the beginning of next Session, are reminded that delay will be avoided if their nomination forms are forwarded to the hon. secretaries not later than the end of March. The subscription of an ordinary member elected after the last day of April covers the ensuing Session.

ERNEST S. GALE
F. T. W. GOLDSMITH } Hon. Secs.

THE EXAMINATIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.—NOTICE IS HEREBY GIVEN that, after the close of the year 1893, all gentlemen who desire to qualify for Candidature as ASSOCIATE of the Royal Institute of British Architects (except in special cases submitted to and approved by the Council) will be required to enter for the PRELIMINARY Examination, and having passed it, work up through the INTERMEDIATE to the FINAL Examination, which in 1894 will take the place of the present "Examination in Architecture." The only examinations to which young Architects who are in practice, and who desire to become Associates without passing the Progressive Examinations, can enter, take place twice in the year 1892 and twice in the year 1893. Those, therefore, who may not be prepared to enter for the "EXAMINATION IN ARCHITECTURE," before the close of 1893, should take immediate steps to secure registration as Probationers, which they can do by passing the Preliminary Examination or obtaining the grant of exemption therefrom.

ASTON WEBB, Hon. Secretary.
WILLIAM H. WHITE, Secretary.

The Royal Institute of British Architects, 9, Conduit-street, Hanover-square, London, W., 25th January, 1892.

◆

A new wing, which has been added to the North Ormesby Cottage Hospital, Middlesbrough, was opened last week by Viscountess Falkland. On the ground floor of the new building there is a large room for out-patients, with a dispensary, doctor's room, and a dressing-room. The first floor contains the nurses' day and bedrooms and bathrooms. Mr. Thomas Dickson, of Middlesbrough, has executed the work from designs of Mr. J. M. Bottomley, of the same town. The cost has been £2,006.

As the result of a joint meeting of representatives of the Glasgow corporation and of the directors of the Caledonian Railway Company, Mr. W. R. Copeland, deacon-convener of the Trades House of Glasgow, has been appointed arbiter in connection with the Central Railway in room of the late Mr. Galloway.

Trade News.

WAGES MOVEMENTS.

COVENTRY.—At the end of last year the bricklayers, plasterers, and labourers employed in the building trade at Coventry forwarded a three months' notice to the master builders for an increase of wages. Two years ago the wages of bricklayers and plasterers were advanced from 7d. to 7½d. per hour, and they are now asking for 8d., as well as for several alterations in the working rules. In August, 1890, the labourers, who were receiving 4¾d. per hour, came out on strike and asked for 5¼d. This being refused the men returned to work, and were paid at the old rate of 4¾d. per hour until April last, when the masters agreed to increase the rate to 5¼d. The present demand is for another farthing, making the rate 5½d. The masters have held a meeting to consider the demands, and though of opinion that the increase cannot be granted, they stated that they were willing to meet delegates appointed by the men, and if they could not agree they would refer the matter to an independent arbitrator.

◆

CHIPS.

Mr. Gawthorp, of Long Acre, has just issued a book of designs and examples in wrought metal-work, which will deservedly find a place in architects' offices. Designs are shown for lecterns, oil, gas, candle, and electric-lighting, altar-crosses and lights, alms-dishes, &c., in polished brass, and for chancel screens, gates, railings, font-covers, grilles, signs, fittings for lighting, &c., in hammered iron in all styles.

New R.C. schools in Granville-street, Kilburn, were opened last week. They accommodate 350 children, and have been built at a cost of £2,500, including site, from plans by Mr. E. D. Hansom.

The tenor bell of the cathedral church of Winchester, which was found to be defective, consequent on a crack in its base, has been removed from the belfry by Messrs Mears' men, and has been taken to London to be broken up, the new bell being ready for hanging. The old bell was cast early in the last century by Phelps, who founded the great bell of St. Paul's, and the Messrs. Mears are the descendants of the famous bellfounder, and have cast the new tenor. The old one weighed over 1½ tons.

Mr. Arnold B. Mitchell, A.R.I.B.A., read a paper on "The Vaulted Roofs of the Middle Ages," at the London Institution, Finsbury-circus, on Monday evening last.

The London County Council resolved on Tuesday to invite applications for the post of second officer of the fire brigade, at a salary of £350 a year, rising by £25 a year to £500, with quarters, coal, and gas, the value of which (£100) should be taken into account in calculating pension; and that the limits of age of candidates should be fixed at thirty and forty years. At the same meeting the offices committee reported to the council that they had under consideration three sites, either of which, subject to price, would be suitable for the erection thereon of new offices and a council chamber. Authority was given the committee to enter into negotiations.

◆

Holloway's Pills exercise the inestimable power of thoroughly cleansing each component part of the blood, and rendering this fluid fit to perform its important functions. They cope most successfully with chest diseases, stomach complaints, liver disorders, and many other maladies, which were once the besetting dangers of mankind at certain seasons in town and country.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent.—
Mr. E. A. WILLIAMS. 16. Craven-street, Strand, W.C.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

GOODMAN, HUGHES, & CO.,
TIMBER MERCHANTS, IMPORTERS, BROKERS,.
TIMBER AUCTION MART,
44 TO 47, BISHOPSGATE STREET WITHOUT, E.C.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BARNES, SURREY.—For the erection of the new church of St. Michael and All Angels. Mr. C. Innes, architect:—

Balaam Bros. (accepted).

BRISTOL.—For new front and other alterations at Nos. 112 and 114, Victoria-street. Mr. J. H. La Trobe, A.R.I.B.A., architect. Quantities supplied:—

Baston	£215	0	0
Church	210	0	0
Walters	210	0	0
Forse	200	0	0
Hayes	199	0	0
Davis	187	0	0
Cowlin (accepted)	173	0	0

All of Bristol.

BRISTOL.—For fittings for grocer's shop, Clifton. Mr. J. H. La Trobe, A.R.I.B.A., architect:—

Forse (accepted)	£495	0	0

BRISTOL.—For additional works at the city of the central electric-lighting station at Temple Back, for the city council:—

Durnford and Son (accepted)	£6,670	6	6

(The lowest tender received.)

BRISTOL.—For erecting and constructing a 16-chamber brick kiln (Sercombe's patent), with flues and 80ft. chimney shaft, for the Netham Brick and Tile Works Co. Mr. Herbert J. Jones, M.S.A., Bristol, surveyor:—

Krauss, A.	£2,990	0	0
Galbraith, W.	2,768	0	0
Wilkins, G. H.	2,750	0	0
Cowlin and Son	2,743	0	0
Wilkins and Sons	2,645	0	0
Eastabrook and Sons	2,497	0	0
Humphreys, G.	2,374	0	0
Perrott, J. (accepted)	2,346	0	0

All of Bristol.

CHESHAM.—For construction of new road, curbing, channelling, sewering, &c., New Town, Chesham, Bucks, for Mr. D. G. Patterson. Mr. Geo. H. Green, Chesham, surveyor:—

Capper, St. Alban's	£771	0	0
Mead, Chesham	650	0	0
Hill, Maidenhead	597	0	0
Morecroft, Acton (accepted)	570	0	0

GREAT YARMOUTH.—For the erection of grand-stand at recreation ground, for the Great Yarmouth town council. Mr. J. W. Cockrill, A.R.I.B.A., Assoc.Mem.Inst.C.E. Quantities by the borough surveyor:—

Beckett, G., Southtown	£1,237	10	0
Leggett, J.,	1,175	0	0
Rand and Cooper	1,170	0	0
Cork	1,150	0	0
Barnard, M., Southtown	1,098	13	8½
Bray, J. F. W.	1,088	0	0
Bracey, W.	1,056	6	0
Eastoe	1,055	12	5
Beech	1,033	0	0
Stevens, East Grinstead	1,028	0	0
Flaxman	1,024	0	0
Grimble and Watts	1,020	0	0
Bond, A. E. (accepted)	1,015	0	0

Rest of Yarmouth.

LICHFIELD.—For the erection of a new workhouse infirmary, for the board of guardians:—

Low and Son, Burton-on-Trent (accepted), £8,000.

For replacing the brick floor of the workhouse chapel with boards:—

Thornloe, J. (accepted)	£55	0	0

HASTINGS.—For the erection of five blocks of artisans' dwellings in Castle-road. Mr. Mark J. Lansdell, architect:—

Accepted tenders.

Excavations:—			
Davis, G.	£536	5	0
Underpinning:—			
Davis, G.	43	10	0
Patent stone steps, landing, &c.:—			
Elliott and Co.	113	15	0
General buildings:—			
Moon and Garner	4,320	0	0

KINGSTON, HEREFORDSHIRE.—For alterations to the sewage outfall works, for the improvement commissioners:—

Hamer, B.A. (accepted)	£95	10	0

LONDON.—For erecting new sanitary blocks, laying new drains, and supplying new sanitary fittings and other works, at the Orphan Working School, Haverstock-hill, N. Mr. C. Bell, F.R.I.B.A., architect. Mr. E. Tidman, C.E., F.S.I., consulting sanitary engineer:—

	A.	B.	C.	D.
Clarke and Bracey	£2,431	£1,695	£257	£4,383
Holliday and Greenwood.	2,383	1,559	197	4,139
Burford and Sons..	2,446	1,295	145	3,886
Wall	2,195	1,348	104	3,647
Irwin Wallas	2,127	1,285	177	3,589
Allen and Sons	2,135	1,310	105	3,550
Bryan, G., and Sons	2,067	1,334	107	3,508
Sharp, G.	2,130	1,070	160	3,360

A.—Buildings. B.—Drainage and sanitary plumbing. C.—Cleansing. D.—Total.

NEWCASTLE-ON-TYNE.—For a three-manual organ, to be erected in Brunswick-place Chapel:—

Harrison and Harrison, Durham	£1,000	0	0

(Accepted.)

PICKERING.—For a footway bridge over the river Severn at Brawby, for the Pickering-Lythe highway board:—

Thackray (accepted)	£26	10	0

ROCHDALE.—For the fitting-up and completion of new mills, for Messrs. Richard Kay and Brothers:—

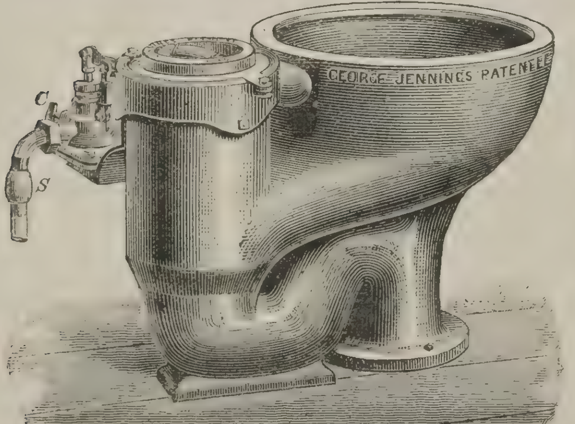
For high-pressure steam-piping for heating:—
Whitehead, G., Bury-street, Heywood (accepted).
For four steel boilers:—
Earnshaw and Co., Heywood (accepted).
For shafting and rope-driving:—
Woods, J. and E., Bolton (accepted).

SOUTHGATE.—For the erection of a residence in the Old Park, Southgate, for Mr. J. B. Freeman. Mr. P. B. Freeman, 6, Gray's Inn-square, architect:—

Monk, A., Edmonton (accepted).

JENNINGS' PATENT VALVE CLOSET & TRAP.

IN ONE PIECE OF STRONG GLAZED EARTHENWARE.



OVER 100,000 NOW IN USE. Fixed in all the principal **MANSIONS, CLUBS, HOTELS, RAILWAY STATIONS, HOSPITALS, BARRACKS,** and **ASYLUMS** in all parts of the world. The **CLEANEST** and **MOST EFFICIENT** Closet of the day, **free** from complication; adapted for buildings of all classes, public and private, with the **latest improvements, new Service Valve, Ball Overflow Discharge Plug,** and **base under Trap,** ensuring the maintenance of a perfect connection with soil-pipe.

This Closet can be arranged with waste-preventing valve mechanism, or with his Improved Waste-preventing cistern, either of which secures the necessary after-flush to the basin. "JENNINGS' extra long **drawn-lead** Bend" should be specified for connecting the outlet of this Closet with soil-pipe.

Architects specifying any fittings "to be obtained from George Jennings" can rely on securing most satisfactory results for their clients, and as a **guarantee of efficiency,** all articles of **his manufacture** bear the Name and Address,

GEORGE JENNINGS, STANGATE, LONDON.

Illustrated Catalogues forwarded on application of latest improvements in
Lavatories, Baths, Urinals, Sinks, Sanitary Appliances, and Water Fittings of every description.

Awarded the **GOLD MEDAL,** Paris Exposition, 1889.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXII.—No. 1935.

FRIDAY, FEBRUARY 5, 1892.

ARCHITECTURAL TEACHING.

ONE of the characteristic marks of the architectural teaching of the present day is its practical tone. It is no longer a matter of Orders, or Styles, or theoretical proportions, but one of actual building, of dimensions, and of materials. The architect must now be a builder first and fundamentally before he presumes to make a plan or design an elevation; and, according to some of those who have set themselves up as instructors, the young architect must be so much of a surveyor as will enable him to prepare his own set of quantities, to make a valuation or a specification of repairs. A low view of architecture as an art, some will say. Perhaps—nay, probably it is, to those who have not the power to endow the prosaic, to make the commonplace artistic, and to give grace to the utilitarian. These practical teachers of art may sometimes lack the original genius or artistic endowment themselves—they may look at architecture only as building; but the real artistic designer can make use of all these branches, and, so to speak, turn them to an architectural account. Take, for example, the constructive problem of placing a roof on four walls—one of the commonest operations of the builder. The practical inartistic builder would not trouble about such questions as how to dispose the roof to the best advantage, what proportion of height to span should be given, whether a simple span or a roof with hipped ends would be best: but these are exactly the points which the architect would trouble himself about. He would certainly try one or two proportions to scale, sketch the effects of gabled and hipped ends before deciding on the construction of roof, and would probably come to the conclusion that simple high-pitched, hipped roofs, such as the typical chateau roof one sees on the towers of French chateaux, would be more pleasing than a flat hipped or gabled roof. The ordinary builder would, in all probability, select the latter, believing it to be more economical as a covering, without any thought for the proportion, and be content to cover a lofty warehouse of oblong shape by a flat roof, than which nothing can look more hideous. Extreme simplicity may be the result in both the artistic as well as in the non-artistic methods; but while one would show thought and art, the other would be thoughtless and feelingless. We might easily extend this line of argument to the designing of some of the commonest utilitarian structures, to show that building may be either nothing but mechanical labour or a product of the artistic functions. We can make it either, one or the other, just as we begrudge or bestow thought on it. In this way, then, the architectural student can turn his knowledge of commonplace building to account. To him it need not be a mere matter of so much brickwork and timber and labour, but the problem of how to combine material and labour to the best advantage, and make them subserve an artistic end. So with other labours which appear prosaic.

Mr. Macvicar Anderson's vindication of the art of planning addressed to students at the Institute, a full report of which will be found in our last issue, is well timed. We have so often urged the claims of planning to be considered the very fundamental of good design, that it would be superfluous to go over the ground and arguments used by the president. Yet it is well to endeavour to eradicate the commonly-received idea that planning is a prosaic matter like specification writing, and again and again to insist upon its being the very root of good architecture, and to be as much a question of art as making an elevation. Till it is recognised as the only foundation of a good design, involving the exercise by the imagination—in short, till it is considered to be an art, all the lecturing in the world about the importance of a good plan will be thrown away. How many men there are who look upon planning as drudgery, as having no reference whatever to the design of a building, as something upon which the elevations may be made to hang together? It is hopeless to impress such minds with the idea of an art of planning, as they cannot realise what architecture is in its entirety. When they conceive that a design for a building depends as much upon its internal as it external distribution, and that all that is important in a design is the outcome of plan; they may begin to realise the value of the study, and to regard it from other than a mere prosaic point of view. Look at the artistic possibilities evolved out of plan, how it shapes outline and masses, giving prominence to certain features, and scope to the imagination. But, of course, only to the artistic mind are these things possible, for a man may make a skilful plan without knowing how to develop it; hence Scott's remark that "mere planning" will not by itself "produce a noble building." To the great bulk of those who make plans of buildings, a clever plan means simply one satisfying convenience and utility without any further concern. What is wanted is to encourage the idea that plan and external design are correlative factors—that one is as important as the other, that there is as much art in the design of a plan as there is in the design of an elevation; that both are integral parts of the whole.

The vital importance of making the study of plan a prominent one in future architectural education is obvious. Hitherto it has taken no higher place than one of the commonest and utilitarian functions of the architect, the exercise of a kind of adroitness in disposing entrances, passages, and rooms to be convenient, in which blind chance had as much to do as intention and skill. But it is now beginning to be recognised that there is something that can be learned—a problem to be thought over. Art can be called to the solution, even that art which sees how to avoid disagreeable results, if it does not aim higher. For instance, we have many daily experiences of this. Plans are required for a hall on a plot of land of trapezoidal shape at the corner of two roads meeting at an acute angle. There are only three possible solutions: to make the hall partake of the inclination of the sides, producing a wedge-shaped building; to make it rectangular, and thereby sacrifice some of the space on one or both sides; or to so dispose the outer walls as to make the building utilise the irregularity of the site. The first idea would be the conception of a novice or ignorant person; the second of the man who only regarded the practical requirements of structure and roofing; the latter of the artistic mind who could see the value of giving projections or transepts at the end of his building where the land was widest. What would be the actual results? A distorted building, with twisted roof or flat, would be the result in the first case, a barn-like structure in the second, and a building of artistic form and broken outline in the third case. It would be very instructive to discover how much of the architectural merit of our great buildings has been due to plan. Certainly a poor, ill-devised plan may be made presentable by artistically-designed elevations, but never a work of true architecture. All our successful architects have been good planners, because in their mind's eye they keep the internal and external effect constantly in view.

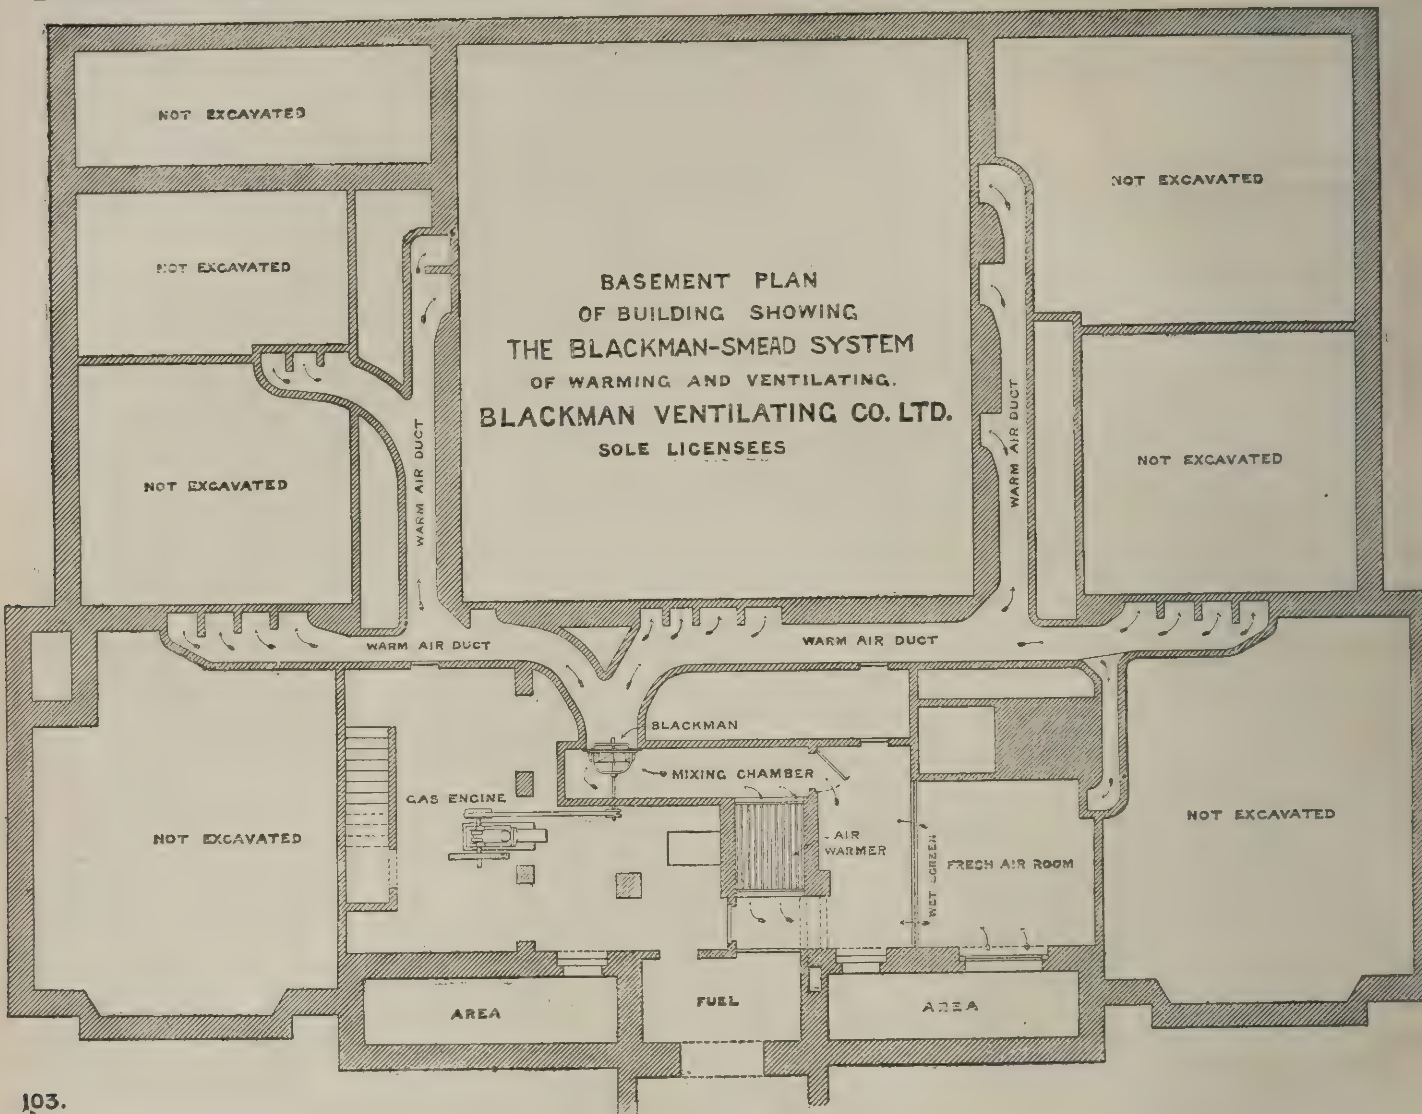
The practical teaching of the day has the misfortune of separating utility from art—of making, in a word, the studies of construction, of plan and of materials distinct from that of architecture. We see the consequence of this teaching in the way in which special divisions of the art is taken up. For example, the surveyor tells us that it is in the interest of architects that specifications should be prepared and written by the quantity surveyor; that even the working drawings and details would be better prepared by him under the architect's general direction. The engineer engaged in iron construction makes out a strong case that the constructive scheme and working details of an iron structure should be left to him; and we have many in our profession who think that the architect's duty is only to design the elevations of a building to a plan prepared by a practical man. In each of these instances there is the presumption that the practical and utilitarian construction is a totally distinct thing—that, in fact, building and architecture are distinct occupations requiring different capacities and methods of instruction, and that they cannot be conjoined; and as long as this idea prevails, or is suffered to prevail by an apathetic profession, the studies will be pursued with different objects.

* * *

AN OPPRESSIVE BUILDING LAW.

MANY vacant sites, that have been left in the proximity of old buildings by the demolition of premises for street improvement, are lying idle. Around these desolate and often dirty and objectionable plots, windows with the ominous words "Ancient Lights" appear; and many of these lights are near the ground, and placed in positions that render it almost impossible to build on the site without interfering with them or obstructing the light. In many cases the plots are too small for any but one-story buildings to be erected without compensation, and the wonder is why the authorities could not have acquired the premises in the rear. The new street has, in many cases, been widened by cutting through a row of houses on one side of the old thoroughfare, leaving only a portion of the courtyards at the back, quite insufficient for the purpose of building a new frontage of shops to the road. These slices of property unavailable for building may be seen on the side of almost every new widened thoroughfare—Charing Cross-road, Gray's Inn-road, the neighbourhoods of Covent Garden, Clare Market, &c. The removal of buildings in the rear of other property at once raises the value of the remainder; they acquire rights which they never possessed before—a condition of things which renders it extremely difficult to deal with intersected properties in large towns. The question is one which calls for immediate legislation in the interests alike of the public and building owners. How are buildings of any dimensions to be erected? What should be the regulations for controlling private rights of light, and how should compensations be assessed?

The law of light has lately received some attention. The Institute of British Architects appointed some years ago a special committee to take into consideration these questions, and a quantity of useful information and evidence was collected. Professor Roger Smith made a report on the proceedings of the committee, in which that gentleman made certain suggestions that would make procedure less oppressive. Since then another committee has been considering the question, and has drawn up a report, the main objects of which are to lessen the delay and cost in carrying out new buildings and alterations



103.

to old ones. The report proposes in brief that the owner or occupier of any tenement who considers his ancient lights will be or have been imperilled by the erection of new premises or alterations, shall have the right to inspect the drawings prepared by the building owner, and take such particulars therefrom, or the building if erected, as may enable him to ascertain whether there is ground for complaint; that if he considers his lights will be interfered with, he may, within seven days, give notice of his objection to the building owner, together with the name and address of a surveyor. Upon acknowledgment of the receipt of such notice the building owner shall send the name of his surveyor, and that such surveyors shall, within seven days, meet and discuss the objections, and come, if possible, to an agreement, or, if not, refer the matter to an umpire. Other clauses give power to either party to appeal to a tribunal composed of two barristers, three Fellows of the Institute, and two Fellows of the Surveyors' Institution.

It is not to be denied that these rules will facilitate building operations which now are retarded owing to vexatious proceedings at law. But we should have preferred a formulation of some rules that would have been accepted in certain cases without reference. One of the regulations that ought to have the sanction of legislation is to what extent a neighbour's rights should be observed by a building owner; in other words, what they are. Also to determine the amount of obscuration that is detrimental, as the angle of light ought not to be difficult in a large number of instances. If these principles are not determinable in ordinary cases, it is impossible to expect that a tribunal can satisfactorily adjust them. As it is now, a neighbour can enforce his rights in so summary a manner as to leave the building owner quite powerless; and as we have had ample evidence to show, the dominant owner can make his own terms or refuse. Now, a person who desires to build on a plot adjoining old premises cannot do so for fear of extortionate demands being made upon him; or, if he does venture, he has to submit to an injunction of the Courts. Then the question of light is a matter of opinion with the Court; as nobody knows what the Master of the Rolls' idea of infringement will be.

With regard to the private rights of owners of property intersected or cut through for public improvements, Parliament can at least abrogate or modify private rights. Now, if public bodies, like railway companies, can compulsorily purchase under their Acts, why should the rights of light stand in the way? Such at least is an argument that has been used; though it may certainly be carried so far as to rob private owners of property of their light and air—very elements of health. We ought not to rob or confiscate that which we cannot create; but we can determine at least how far building may be permitted under certain conditions of notice being given and a fair rate of compensation. In short, we contend simply that it should not be in the power of a neighbour to exact his own terms, or prohibit building by legal and vexatious procedure.

WARMING AND VENTILATING PUBLIC BUILDINGS WITH OR WITHOUT MOTIVE POWER.

A LECTURE on this subject was recently delivered before the Glasgow Philosophical Society by Mr. John D. Sutcliffe, of Manchester. The lecturer remarked that for the past eight years he had entirely devoted himself to the subject of mechanical ventilation, and wished to draw a few conclusions from the experience gained when inspecting and reporting upon over 8,000 buildings. Twenty years before mechanical ventilation was thought of in Scotland it had become recognised in America as the only safe plan on which large buildings could be ventilated, for as far back as 1851 the Association of Medical Superintenders unanimously agreed that all hospitals should be warmed by fresh air passed over pipes containing steam at low pressure or hot water, and placed in the cellar of the building heated, and further that a system of forced ventilation in connection with the heating was indispensable to give purity to the air. In Scotland, Mr. William Cunningham, a flax spinner, of Dundee, was the first to employ a mechanical system of positive ventilation to schoolrooms, and the lecturer believed that if Mr. Cunningham had been able to devote his whole time to ventilation he would have soon found out the weak places in his system, one of which, the author pointed out by means of illustrations, was to admit the fresh air at each end of a room, and to draw it off on each side, thus producing an even distribution of the warmed air. Mr. Sutcliffe exhibited a series of illustrations showing how the warm air really behaved in a room, taken from an article by Mr. Briggs, architect, of Bridgeport, Mass. In the first case the warm air was admitted at the floor and exhausted near the ceiling, in accordance with the theory that warm air must be bad

4.

air. As they let the warm air out and left the occupied portion cold and foul, they were always closed in winter, and consequently the ventilation was *nil*, or bad. In the second case the air was admitted at a height of 8ft. on one side, and taken out near the ceiling on the other side, necessarily leaving the whole of the space below 8ft. without any warm air. The third example approached a little nearer to the right method, as the outlet was brought a little lower down; and in the fourth case the arrangement was still better, the outlet being brought to the floor, although the inlet was still kept about 8ft. high. The fifth instance came very much nearer the perfect system, as the inlet was at the floor level and the outlet also at the floor, leaving but a very small space unoccupied. The most perfect system was, the lecturer remarked, that shown last: in this the inlet was a little above the breathing line, and the outlet on the floor line. Unfortunately, the latest buildings which had been mechanically ventilated copied the faults as well as the virtues of Cunningham's system, with one notable exception, that the cumbersome and expensive air-pump was replaced by the Blackman air-propeller, which, as Mr. Cunningham had generously remarked, was much simpler and cheaper. At the present time in every trade throughout the world the Blackman fan was doing good work, over 10,000, averaging 36in. diameter, being used for industrial purposes alone, with immense improvement to the condition of the workers. The lecturer proceeded to explain in detail the American Smead method, which was a warm-air system as distinguished from a steam-heating or hot-water system. The author had never seen a hot-air apparatus working satisfactorily in this country, and the chief reason for their failure was because the furnaces were not of sufficient capacity, and no proper system of changing the air was adopted, and therefore the air was scorched. Mr. Smead gave the following reasons why this system was to be preferred—1st, because the first cost of the Smead was about one-third less than for first-class steam heating; 2nd, expense of fuel was from one-third to three-fifths less; 3rd, there was no possible danger from explosion with air-warmers, whilst with steam there was constant danger, whether the pressure were high or low; 4th, there were no water-pipes to freeze or burst; 5th, repairs for steam-boilers, pipes, and pumps would cost in the first ten years ten times as much as for the Smead, and the repairs had always to be made by a skilled mechanic, whilst any caretaker could repair a worn out air-warmer; 6th, the Smead would warm the air in any weather; 7th, with it the building could be warmed in one hour from the time the fires were fairly burning, whilst with steam five or four hours were required; 8th, three-fourths of the force generated by the burning fuel in steam apparatus was lost in the form of mechanical motion, and did not appear as temperature in the room; whilst in the Smead seven-eighths appeared in the room as temperature, and only one eighth as loss; 9th, with the Smead, absolute uniformity was secured throughout the building; whilst with steam-heating apparatus, the rooms furthest away from the boiler were 10° to 15° colder than the nearest rooms, in extremely cold and windy weather. Heat manifested itself in two ways—namely, as temperature and as expansion. Water at the normal pressure could be heated to only 212° Fahr. However much fuel was consumed, the water would still remain at 212° Fahr., but the force generated by the consuming fuel was not lost, but was transmitted to the water in the form of expansion, and the water was converted into steam. Now, if the water were confined, and this tendency to expansion resisted, the temperature could be raised to almost any extent; but if not thus resisted the temperature would not rise above 212° Fahr. The mechanical work of forcing the steam through the pipes was performed at the expense of temperature. If a building were warmed by steam three-fifths of the force generated by the burning fuel was consumed in the form of mechanical motion. On the other hand air could be heated to 600° Fahr., so that nearly all the force generated by the burning fuel appeared as temperature, whilst scarcely a particle appeared as mechanical motion. Few persons understood how the air in a room was warmed. It was generally thought that the air in immediate contact with the burning fuel or heated stove was warmed, and that this air warmed more air, and so on, until all the air in the room was heated. This was not so. In the case of an open fire, the air next to the burning fuel was warmed, and for the most part went up the chimney. A small part, however, rose, and the cold air took its place. The lecturer exhibited a diagram, showing plans and sections of two buildings, the one warmed and ventilated on the "aspiration" method, and in its details known as the Smead system, and the other a mechanical method, known as the Blackman-Smead system. By "aspiration" he meant heated chimneys or shafts for the removal of foul air. "Mechanical" ventilation was produced by the action of fans creating an air movement regular and unvaried, in stated volumes, removing the foul air, and drawing in fresh, pure air to take its place. The Smead plans showed a school at Pawtuckett, Massachusetts, which he believed to be one of the finest schools in America. Much more was made of the basement in America than we make of it in this country, for four air-warmers were employed, and two large ventilating stacks. The air entered the fresh-air rooms, passing afterwards under and over the four heaters, and then found its way through the vertical air ducts to the rooms above. The warm air rose through the flues, and was distributed through the rooms, returning to the foul-air chamber on the same side of the room as it left the warm-air register. It was then brought down into the foul-air duct in the basement, and from this foul-air duct it was carried underneath the closets. The action of this warm air was to evaporate all the moisture in the excreta, and the air was then drawn forward by the ventilating shaft, which, by the way, had a large heater fixed to it, and so the foul air was carried above the top of the building. The class-rooms were carefully warmed, and there was also a large warm-air register in the floor in each corridor. This register was always open, so that if the teacher closed off all the warm air from the schoolrooms, there was still an exit for it into the corridors. Special arrangements were devised by Smead for admitting all warm air, or all cold air; but the teacher must have the full quantity coming into the room, warm or cold, so that it was quite impossible to stop the ventilation. There were no valves to the outlet ducts; these were always open. Mr. Sutcliffe next explained the Blackman-Smead system of ventilating and warming, which differed from the Smead in the important point that it was a mechanical as against a system of "aspiration," the reason for the difference being that the air of an over large town needed filtration, and the filters offered such an obstruction to the air that nothing less than motive power would drag it through them. The accompanying illustrations show the application of the Blackman-Smead system to a building by the single duct system. The figure marked Fig. 103, the lecturer continued, gives the plan of the basement, showing gas-engine, tubular air warmer, fan, wet screen, and air ducts. The Blackman fan pulls air from outside into the fresh-air room, thence through the wet screen, which will intercept the soot or dust. The cold air then passes to the tubular air warmer, which raises its temperature to 100° or 120° Fahr., and thence into the mixing chamber, into which cold fresh air can be admitted by the door. The Blackman forces this air through the horizontal duct to the vertical flues that lead to the rooms above. The building can thus always be flooded with pure warm air in winter and pure cool air in summer, and as each room has its own separate flues, any room can be supplied with warm air in winter and cool air in summer independently of the rest. Fig. 104 gives the plan of the ground floor, with the warm air and ventilating flues. The corridors also receive their supply of fresh air from independent flues, and are so kept warm and sweet. The ventilating flues run up to the roof space, where horizontal ducts lead the vitiated air to the tower, where it escapes into the open air. The inlets are placed about 7ft. above the floor of the room, and over these are fan registers by which the flow of air is controlled. The exhaust registers are near the floor line, so that the vitiated air is drawn off through the ventilating ducts to the tower. The lecturer further gave explanations of the Blackman-Smead system of warming and ventilating by the double duct system, in which one horizontal duct is placed above another. At the entrance to each duct a Blackman is placed, which forces cold air into the lower duct and warm air into the upper duct. From the sides of these horizontal ducts, flues are carried up to each room in the building. At the bottom of each flue is an opening into the cold-air duct, by which cold air can enter the flue. Above this is another opening, which admits warm air to the flue. Between the two openings is a valve hung in a frame, and controlled by a chain from the room above. When the valve is down, warm air only is allowed to pass up the flue into the room. If the room becomes too warm, the valve can be raised, which will allow cold air to enter the flue and mix with the warmer air, thus reducing the temperature of the admitted air without restricting its volume. By this means continuous ventilation is assured at whatever temperature may be desired. In conclusion, the author gave the following practical data as a guide to the size of inlets for warm air and outlets for vitiated air. In large schoolrooms and public buildings the best results are obtained when the fresh-air inlets are placed about 7ft. above the floor-level, and the foul-air outlets on the same side of the room and at the level of the floor. With the "aspiration" method of ventilating, the outlets should be larger than the inlets, and the dangers of cold draughts would then be reduced. In buildings ventilated by the "mechanical" method, the area of the inlets for fresh air should be larger than the outlets, and then the rooms are placed under a little pressure, and all the air from crevices, &c., flow outwards, and no draughts are felt. The rule in estimating the area of inlets for admitting fresh air, and the area of outlets for getting rid of the impure air, must depend upon the number of persons who will occupy the room, and not upon the size of the room.

BUILDING STONES: THEIR STRUCTURE AND ORIGIN.

(*Concluded from p.* 162.)

THE organic origin of a limestone is most conspicuously shown by the shell limestones, often called marbles, for they are almost, if not quite made up of fossil shells, of considerable size, cemented together by calcareous matter. The fossil shells composing the chalk require a microscope for their detection, but the shells that make up the forest marble, the Purbeck and the Sussex marbles, are at once seen and recognised as "familiar objects of the sea-side" or the river bed. Forest marble, an Oxfordshire rock of the Lower Oolites, is a mass of marine shells, and the Purbeck marble and the Wealden marbles of Sussex are made up of fresh water shells. In the forest marble there is a variety of shells, but in the fresh water limestones just named there is but one genus represented, the *Paludina*, one species of which in the Purbeck marble is a small one, and in the Sussex marbles a large one. As is well known the Purbeck marble was in great request with the builders of Early English churches, and in the great example of that architecture—Salisbury Cathedral—was very extensively used. But in the Temple Church in London, not only in the slender attached pillars, but also in the recumbent figures of the knights, the sections of the multitudinous *Paludinæ* may be very well seen. The beautiful encrinital marble of the carboniferous limestone of Derbyshire also conspicuously displays its organic origin, the interesting forms and figures on its polished surface being but sections cut at various angles of portions of stems of ecrinites, or stone lilies as they are sometimes called, that flourished on the beds of the carboniferous seas. In the carboniferous shell and encrinital marbles it will be noticed that a considerable part of the mass of the stone has no organic structure, but is crystalline calcareous matter. The amount of this part of the mass is less in some and greater in other stones, and is so great a proportion of the whole in some limestones that the organisms they contain are but few and far between. Such, for instance, are some of the Derbyshire marbles, the Irish marbles, the beautiful grey Anglesea marble, and the splendid richly-coloured Devonshire marble. And in some Palæozoic limestones the whole is non-organic in structure, as in the black marbles of Ireland and the Isle of Man. The great steps of St. Paul's, it may be mentioned here, are from the carboniferous black marbles of Poolvash, near Castletown, in the Isle of Man. The formation of these hard, compact crystalline limestones, which, taking a good polish and being ornamental, are called marbles, is well illustrated by what is now taking place in the coral-rock regions of the tropics, where recent coral rocks are so altered by the action of water as to be converted from a mass of coral to an almost entirely compact crystalline rock. That the climatic conditions were here favourable for coralline growth and development is abundantly shown by the coral structures that have remained unobliterated, and which form beautiful and interesting markings in the carboniferous marbles of Derbyshire and Anglesea, and in the Devonian marbles of Devonshire. There are some compact marine limestones in the cretaceous rocks of the South of England of considerable interest. One is now much used in building operations in London, and well known as Kentish rag. It occurs in thin beds in one of the divisions of the Lower Greensand called the Hythe Beds. The Kentish rag is not a pure limestone, some specimens containing a considerable amount of silicious matter. Its structure is such that it is only adapted for dressing with a rough face in small-sized stones, and is therefore only used for ashlar work. In the Upper Greensand of Surrey is a fine calcareous stone, soft when worked, but hardening on exposure, that is largely quarried at Merstham and Godstone as a firestone, but in ancient times it was used as a building stone, having been employed at Windsor Castle and Westminster Abbey. A somewhat similar stone is the Totternhoe stone near the base of the chalk. Although the Secondary and Palæozoic rocks supply the chief British limestones, perhaps the greatest limestone of the world is a Tertiary rock of the age of the sands of Hampstead Heath, and newer than the clay on which London stands. This is the Nummulitic limestone of Middle Eocene age, that extends from France eastwards to the confines of China. It supplied the builders of the Pyramids of Egypt with material, and it supplied to the builders of Paris the beautiful stone which has been so instrumental in giving due effect to Baron Haussmann's magnificent plans. It is a compact and pure limestone, with, in some places, as in Egypt, an abundance of the fossils that have given it the name of Nummulitic limestone. These fossils, circular, about the size of a halfpenny or farthing, are the remains of a marine genus of the class Foraminifera. The Paris stone is called the calcaire grossier, and does not display the nummulites as do the blocks of the Great Pyramid. Another Tertiary well-known limestone is the Maltese stone of Miocene age, the adaptability of which for fine and delicate carvings was so well shown at the Colonial Exhibition. In the Isle of Wight there is a Tertiary limestone called geologically Bembridge Limestone, that has long been quarried for building purposes, and was used in the building of Winchester Cathedral. There is a peculiar and important limestone that may, perhaps, be named here. This is dolomite or magnesian limestone, which contains, as its name implies, a considerable amount of magnesia, it being a carbonate of lime and a carbonate of magnesia. It is a compact stone of a warm cream-colour, and may be seen in London at the Houses of Parliament and the Museum of Practical Geology, Jermyn-street, both of which edifices are built of it. Some of the oldest abbeys and Castles of East Yorkshire are built of Magnesian limestone, but in London the sulphuric acid of our abnormal atmosphere attacks it with injurious effects. Magnesian limestone is of Permian age, and may have been formed by chemical precipitation in inland lakes or seas, or it may have been produced by the conversion of ordinary limestone into one containing a proportion of carbonate of magnesia by the addition of that mineral by water action, and the subtraction by similar means of some of the carbonate of lime. Inland salt lakes are known to contain the chloride of magnesia, and hence we may probably conclude that this has been the source of the magnesian part of dolomite. Although much of the substance of all ordinary compact limestones has been formed by chemical precipitation of carbonate of lime from water holding it in solution, yet the bulk of these rocks were originally due to organic action, but there is an important and historic limestone that is entirely due to chemical precipitation. This is the great building-stone of Rome, travertine. Of this material was built the Coliseum and the other great edifices of Imperial Rome, for it was into a city of Travertine, not of Marble, that Augustus changed the old brick-built Rome. Travertine has also been the great building material of Rome from ancient times to the present day, St. Peter's, and the churches and basilicas of mediæval times being built of this hard limestone, which is conveniently obtained from the neighbourhood of Tivoli, where it is even now in process of formation in the fresh waters coming from the Apennines. These mountains are largely composed of limestones of Cretaceous age, called the Apennine limestone, and their streams consequently contain much calcareous matter in solution. On the waters losing some of their carbonic acid, solid carbonate of lime is thrown down, and thus great masses of hard compact limestone are formed. At the Lago di Zolfo in the Campagna the formation of travertine may be conveniently seen now going on. Another example of a purely chemically formed limestone is the very beautiful translucent material, now commonly called onyx stone, or onyx marble, but more correctly Oriental alabaster; for, of course, it has nothing to do with onyx. This was the original alabaster, the alabaster of the ancient world and the Bible, and was obtained from quarries in Egypt and Algeria. The latter supplied Rome and Carthage, but they were lost for hundreds of years, and only rediscovered at Blad Recam in the year 1849. The

---

[*] By Prof. J. Logan Lobley, F.G.S.; a paper read before the Society of Architects, Jan. 26, 1892.

irregular circular markings indicate the stalagmitic origin of the stone, for it has been the infilling of cavernous hollows in limestone rocks. This Oriental alabaster differs essentially from modern ordinary alabaster, which is not a carbonate but a sulphate of lime, a much softer material than the carbonate. It is, in fact, but a fine massive form of gypsum, and is only adapted for interior work and ornaments. In salt lakes that contain sulphate of lime in solution, it is precipitated by the evaporation of the water before the chloride of sodium or common salt. We thus see how beds of gypsum and alabaster have been formed. In England these beds chiefly occur in the Triassic rocks in which are also our great workable beds of salt, the result of the evaporation of the salt lakes of the Triassic epoch. There is a special class of limestones which now demands our attention. These are the true marbles. The term marble is generally used, as we have seen, as a name for a hard limestone that takes a polish, and so forms an ornamental stone. But a marble in the strict geological sense must be a metamorphic rock, and possess the peculiar structure produced only by metamorphic action. This metamorphic action has been the result of great heat, and a pressure which has prevented the evolution and escape of carbonic-acid gas. An ordinary limestone or mass of chalk subjected to such heat and pressure is converted to a mass of crystalline granules of calcite of very uniform size, each of which has its own independent lamellæ, showing a twinned arrangement, and cleavage lines. Such is the structure of pure white statuary marble, whether Italian or Greek, and of all the beautiful and very varied veined marbles of the south of Europe. The chalk of Rathlin Island, off the north coast of Ireland, has been converted into finely granular marble by the heat from the lava that formed the dykes of basalt now traversing the old chalk beds; and the compact material formed into carved cameos, and sold as lava of Vesuvius, is simply limestone altered by the volcanic heat of Vesuvius when blocks have been torn from the underlying great bed of Apennine limestone at unusually violent or paroxysmal eruptions. The marble of Carrara is the statuary marble of Italy, but in Greece there are two famous pure white marbles, the Parian and the Pentelic, the latter of which was the building stone of the Parthenon of Athens. Although the Carrara marble of Italy is a splendid material for statuary, the Greek marble surpasses it in brilliancy of surface, and Italian sculptors can detect an antique statue of Greek marble by the brightness of the stone. The structure of these marbles is so like that of lump-sugar, that the name "saccharine marble" is used. The beautiful colours and veinings which so many marbles display are due to the more or less irregular dissemination of various mineral matters throughout the mass, and which have not been destroyed, like the organic structures, by the metamorphic action to which the original limestone has been subjected. The origin of a white or veined true marble is, therefore, the same in the first instance as that of other limestones, as, for instance, the Carrara marble is altered Apennine limestone of the same general age as the Chalk of the North Downs, and the alteration it has undergone has been due to great masses of the rock having been subjected to high thermal conditions, while covered over by such thicknesses of rocks as were necessary to give the requisite pressure. The Argillaceous rocks worked for building material are the slate rocks, for although clays are abundantly used for bricks, tiles, and terracotta, and some shales, as the Ludlow mudstones, are locally used for rough walling, no clay rocks produce valuable stone except the slates. Slate rocks are metamorphosed clays, and are of various geological ages. The fine slates of Carnarvonshire are some of Cambrian and some of Silurian age, while those of Valencia, on the south-west coast of Ireland, are Devonian, and those of Cork are Carboniferous, and on the continent of Europe there are Mesozoic and even Tertiary slates. The term slate, like that of marble, requires definition, for some fissile limestones, locally used for roofing purposes, are incorrectly called slates, as the Stonesfield slate of Oxfordshire, and Collyweston slate of Northamptonshire. A true slate, like a true marble, is a metamorphic rock, and so has a changed structure, from which organisms have been eliminated by the metamorphosing heat, and possesses new characters that make it a quite different rock in all except chemical composition.

The great and essential character that distinguishes a slate is slaty cleavage, which is quite distinct from ordinary rock cleavage in having its direction across instead of parallel or coincident with the plane of original bedding or deposition. Thus a flagstone or the thin Oolitic limestones of Stonesfield and Collyweston split quite in accordance with their bedding-planes, but a Penrhyn or Festiniog slate splits either at right angles, or at a high angle, with the original stratification of the unaltered rock. It is now established, through the observations and experiments of Sorby, D. Sharpe, and Professor Phillips, that this new and remarkable character has been given to the rock by the great lateral pressure to which it has been subjected, and which has changed the direction of the longer diameters of the particles forming the mass from a horizontal to a more or less vertical direction, and has, in addition, to some extent elongated them. This action of the forces of nature has been imitated artificially with successful results, an arrangement of layers of matter having been converted by great pressure at the sides into a mass in which no layers were to be found, but instead vertical cleavage planes. The pressure to which these rocks have been subjected has been accompanied by great heat, which has converted clay rocks into the semicrystalline stone called slate, and imparted to it a very close and dense texture, which makes it weigh 170 to 180lb. to the cubic foot, and gives it a resistance to a crushing force of 20,000lb. to the cubic inch. The transverse strength of slate is greater than that of any other stone. The mineral of which all argillaceous rocks are essentially composed is kaolin, a pure white clay, consisting of silicate of alumina. The chemical elements of all clay, shales, and slates are therefore aluminium, silicon, and oxygen, and we must consequently trace the origin of slate through the history of the formation of a bed of clay. Kaolin is produced by the decomposition of the felspar of felspathic rocks such as the granites. This is washed into streams and rivers, and so is conveyed to the sea where, consisting of matter in an extremely fine state of division, it is carried further from the shore than is the silicious sand, and so is deposited separately, which produces an accumulation of argillaceous or muddy material that subesquently becomes a bed of clay. Like sandstones, beds of clay are not altogether or even mainly directly derived from the parent source, for old clays furnish material for newer clays, and these again are subjected to denudation, and provide argillaceous matter for still newer argillaceous accumulations. Clays of the older rocks that have long been subjected to vertical pressure have been compacted and hardened into shales and mudstones, and when these at great depths have been subjected to high temperatures and to great lateral pressure, they have been converted, as we have seen, into the hard and strong roofing slate. The extreme tenuity into which slate will split, and the perfect parallelism of the planes of cleavage, as well as the density and strength of the material, are well exemplified by the specimens exhibited in the Museum of Practical Geology, where there is one specimen five feet long and only 1-16th of an inch in thickness produced by simple splitting. Talc is the name of a mineral consisting of a silicate of magnesia, and is represented by various forms as steatite, French chalk, asbestos, jade, &c., but the building stones formed of silicate of magnesia are the Serpentines. Being essentially magnesian, the beautiful stone called serpentine is of an entirely different character from sandstones, limestones, and slate rocks, since they, with the exception of dolomite, are devoid of magnesia, and in dolomite it is present as the carbonate, not the silicate. Although the resemblance between serpentine when polished and some polished marbles is very great, yet it will be seen they are essentially different stones, marble being a carbonate of lime, and serpentine a silicate of magnesia. Serpentine is a metamorphic rock, but unlike, again, marble and slate, it is an altered igneous rock. Much has been written on the production of serpentine, but it may be concluded that the great intrusive masses of the rock, such as that at the Lizard in Cornwall, have been produced by the alteration of igneous rocks that have been rich in olivine which contains about 84 per cent. of silicate of magnesia. Such a rock is the lherzolite of the Pyrenees, an ultra basic rock, and of the very high specific gravity of 3·35. This rock seems to fulfil the conditions necessary for the production of serpentine by the action of permeating water. M. Daubrée, by fusing serpentine with the addition of magnesia, obtained a product possessing the characters of olivine. Serpentine is a compact rock, with the smooth surface characteristic of the magnesian rocks, and a dull or very faint lustre of various prevailing colours, usually green or red, and streaked or veined with steatite and other minerals. The chief locality in the British Islands for serpentine is the Lizard district of Cornwall, where it has all the appearance of an intrusive mass, but is traversed by dykes of gabbro or dillage-rock. But serpentine also occurs in Anglesea, Galway, and other places in Ireland; Banffshire and other places in Scotland and the Shetland Islands. It has been contended that some serpentines may have been derived from dolomites by metamorphic action, and the Serpentinous ophicalcites of the Laurentian rocks of Canada are doubtless altered sedimentary rocks. A very numerous, varied, and important group of building stones may be formed under this heading, for felspar is the prevailing mineral of the granites in their great variety—the syenites, the porphyries, and of the acidic volcanic rocks. Ordinary felspar is a silicate of alumina and potash; and a variety of great importance, called labradorite, is a silicate of alumina and lime. It is the former, usually called orthoclase, that is the mineral constituting this group of stones. The most important of these as building stones are those comprised under the name granite. The granitic rocks are very various, but all granites must contain felspar and quartz. To these may be added mica, hornblende, talc, and other minerals; but ordinary typical granite consists of felspar, quartz, and mica. Granites are therefore very different in character from all the stones previously mentioned, which each consist mainly of but one mineral. The minerals forming granite are likewise, although intermingled and closely packed, yet separate and distinct, and clearly separately displayed to the eye. Since felspar is sometimes grey and sometimes pink and sometimes a rich rose colour, and the prevailing tint being mainly due to the colour of the felspar, granites vary in colour accordingly. That granite has been produced by the crystallisation of its component minerals from a magma in a fluid or fused state, there can be no doubt, and it is possible to ascertain the order of the separation and solidification of the minerals. It is found that the grains of felspar and mica are partly embedded in the quartz grains, and hence it is concluded that the quartz was the last to solidify. It was also found by Sorby and Zirkel that quartz grains contained minute cells partly filled with water. The size of the grains varies very much, some granites being very fine, some very coarse, while many are of medium texture. In the well-known grey Aberdeen granite and the pink Peterhead granite we have perhaps the most typical granites, since they are moderately fine grained, and regularly intermingled felspar, quartz, and mica granites. In some granites distinct crystals of felspar are conspicuously seen. These are called porphyritic granites, some of which are highly ornamental, as is the beautiful rose-coloured Shap granite, seen in the chain posts in front of St. Paul's, in which there are large crystals of rich coloured felspar. The Luxullianite that was used for the Wellington sarcophagus in the crypt of St. Paul's is another beautiful example of a porphyritic granite, and the stones of London Bridge display crystals of felspar of extraordinary size, and afford an excellent illustration of an English grey porphyritic granite. This granite is from Dartmoor, while the granite of Waterloo Bridge is from Cornwall. The exceedingly tough mineral, hornblende, is a constituent of many granites, which form from their great durability excellent road material, and have accordingly been long largely quarried at Mount Sorrel in Leicestershire and in the Channel Islands for the macadam of London streets. But hornblendic granite has been put to a much more interesting, if not so practical, a use, by being employed by the ancient Egyptians for those great monoliths—obelisks and colossal statues—that after three thousand years command the admiration of the world. This granite was quarried in Upper Egypt at no long distance from the seat of government at the time and the places where these fine works were first erected. It was in later times that they were brought to a great distance from their quarries and re-erected in Lower Egypt. Lower

Egypt has in its turn given them up to adorn the public places of Rome, and Venice, and Paris, and lastly London, where, on the Thames Embankment, stands the great obelisk named long after its first erection "Cleopatra's Needle." As the place where this granite was worked was called Syene, the name syenite was given to the Egyptian hornblendic granites. The petrologists have, however, now decided to restrict the term syenite to a rock consisting of felspar and hornblende, which not containing quartz would not be granite. Thus the Egyptian granite, although from Syene, is not syenite, but hornblendic granite. It has been disputed whether there is any grey granite in Egypt. The two famous columns of the Piazza San Marco, Venice, one red and the other grey, are both reputed to be Egyptian, though brought to Venice from Tyre in 1127 by the Doge Michielli. The column on which stands the group of St. Theodore and the Crocodile is doubtless of the red granite of Egypt, but that surmounted by the Lion of St. Mark, of grey granite, if it be Egyptian, is the only great monolith known of Egyptian granite not red, although there are some small works of grey granite reported to be of the granite of Egypt. Granite enjoys a high reputation, and deservedly so, for strength and durability, yet its crushing weight is less than that of slate, being 13,400lb. to the cubic inch, while that of slate is, as before stated, 20,000lb. The great granitic masses of the British Islands and other countries are doubtless true igneous rocks, yet there is as little doubt that some granites are highly metamorphosed sedimentary rocks, for they have been traced back to the original unaltered rock. Although the term "porphyritic" applies rather to the structure than to the composition of a rock, yet the name porphyry usually means a felspathic rock in which there are distinct crystals of felspar imbedded in a matrix of amorphous felspar. These crystals are often small and of a beautiful green or red colour. Such rocks as granite, syenites, and porphyries, although igneous, are not volcanic in origin, since they have been cooled and solidified from a fused state below the surface, and are now exposed only by the removal of the rocks by which they were formerly covered, and so are called Plutonic. But there are some true volcanic felspathic rocks used as building stones. In Italy, especially in Naples, the light pumicious tufa of which so many hills in that volcanic land are formed, is largely quarried as a building material for ordinary houses, the fronts of which are covered with stucco. This tufa has been the product of old volcanic action before the present coast line was formed, when the ashes from volcanic vents fell on to the surface of the sea and subsequently sank to the bottom, where they accumulated and were consolidated into a rock that was afterwards upheaved into land and subsequently sculptured by nature into hills and vales. Unlike other rocks which have been produced by volcanic action, volcanic tufa contains organic remains, that of the neighbourhood of Naples having both shells and plant remains, which clearly testify to its submarine accumulation. The whole of the hilly land forming the site of the city of Naples and its suburbs is composed of volcanic tufa, as are also the famous seven hills of Imperial Rome. In Germany, too, the felspathic volcanic rocks of the Rhine Valley have been worked for building stones and millstones for many centuries, quarries at Andernach having furnished stone to the Roman builders of Cologne. These rocks, well displayed at the Sieben Gebirge and the Drachenfels, are chiefly trachyte, an acidic volcanic rock, of which felspar forms the greater part. Such, too, are the volcanic rocks of Auverge in central France, which have supplied material for some of the buildings of the city of Clermont. Hornblende or amphibole is, as has been before stated, a very tough mineral, and forms a constituent of some granites and of syenite which may therefore be classed under hornblendic as well as under felspathic stones. Hornblende is a silicate of magnesia and lime with iron and manganese, and is of a dark green or black colour. In addition to hornblendic granite and syenites, this mineral is a constituent of the diorites or greenstones, basic Plutonic igneous rocks. They are little used for building stones, but one, the beautiful orbicular diorite or Napoleonite, of Corsica, forms a handsome ornamental stone. For use as paving stones, diorites are of great value, and they are very largely quarried for this purpose at Penmaenmawr in North Wales, and at Bardon Hill in Leicestershire. Near the town of Dudley in Staffordshire, at Rowley Hill, there is a highly interesting igneous rock called Rowley rag, which has been largely quarried for paving purposes, and has also been melted and cast into ornamental articles. It is highly hornblendic and exhibits columnar structure very conspicuously. The mineral giving name to the Augitic group is sometimes called pyroxene, and is very similar in composition and general aspect to hornblende, having magnesia for base, and being of a dark or black colour. With labradorite felspar, it forms the ordinary black lavas, and the basalts and dolerites, which are merely old lavas. These rocks are therefore volcanic, and are formed when a flow of lava issues from a volcano. Basalt and dolerite having a similar composition, differ considerably in texture, basalt being a compact rock with its component minerals so intimately intermingled that they are separately indistinguishable to the eye, while in dolerite the texture is much coarser, and the minerals, though intermingled, can be easily separately seen without the aid of the microscope. Old lavas, or basalts, develop a remarkably columnar structure, as is most conspicuously displayed at the Giant's Causeway at the north of Antrim, and at the Isle of Staffa in the Hebrides. This structure, the result of vertical splitting, is due to shrinkage of the homogeneous mass. Basalt was used by the ancient Egyptians for sculpture, and several examples are now in Rome, the most noticeable being the lions at the foot of the steps of the Capitol. An old form of basalt, the melaphyre, has been used with good effect in the tomb of Napoleon at Paris. The lava-rock of the Neapolitan district is largely used for building purposes, the town of Torre del Greco being chiefly built of it. At the eruption of Vesuvius in 1631, there was an enormous flow of lava which formed seven great rivers of molten rock, that, reaching the sea, produced projecting headlands. This rock is now quarried on the shore of the Bay of Naples, near Torre del Greco, and and incipient columnar structure may there be detected. Lava has been abundantly used in Italy for paving purposes from early times. The Via Sacra and the Appian Way still display the lava pavement of old Rome, and quarries of the rock are close to the famous road over the Campagna at Capo di Bove in an old lava flow from the now extinct volcanic craters of the Alban Hills that terminates near the tomb of Cæcilia Metella. Blocks of lava also form the pavement of the modern city of Naples, and, as is well known, that of the ancient city of Pompeii, where the great polygonal blocks of lava from the pre-historic lava-flows of Vesuvius are grooved by ruts worn by the wheels of Roman chariots. There is much basalt in the British Islands, for volcanic activity has here been great in the past. Old lava forms almost the whole of the county of Antrim, and much rock in Mull and other islands of the Hebrides, as well as at Edinburgh and other parts of Scotland. So, too, in Wales, Cumberland, Shropshire, Staffordshire, and other counties in England; but except as a road metal it does not seem to have been economically worked. The consideration of the structure and origin of building-stones cannot fail to forcibly remind us that the work of constructing the solid rocky framework of the earth has by no means terminated. Still, the physical forces of nature acting on the exterior of the globe are incessantly working, and laying down and accumulating vast masses of silicious and argillaceous materials; still, animal life, in the coral-animals of the Tropics, the Foraminifera of the Atlantic, and the Mollusca of all seas, is extracting from the waters mineral matter which is left, when its producers die, in a solid and enduring form to supply materials for limestone rocks; still, the chemical forces of nature are completing the rocks so commenced and entirely forming others; and still, the internal forces of the globe are producing volcanic action and pouring forth floods of lava to form hard basaltic rocks as in the geological epochs of the far distant past. Life is short, Art is long, but Nature is eternal.

ARCHITECTURE OF SOUTHERN ITALY.

At a meeting of the Leeds and Yorkshire Architectural Society, held on Monday night, Mr. F. W. Bedford gave a lecture, illustrated by lantern views, and entitled "Some Account of the Arts in Southern Italy and Sicily." Mr. W. H. Thorp, President of the Society, introduced Mr. Bedford. The lecturer described the geographical position of the land, its climate, and the beauty that nature has lavished upon it, which made it the coveted land through many generations, and consequently the field of struggle between the older and newer civilisations, and said that, in speaking of the art of Sicily, we must have clearly in our minds its position, thus placed midway between Athens and Rome, and Rome and the mighty power of Carthage. The climate, too, had great influence on the arts, its bright sun and blue sky being reflected in the brilliant colour of its temples. The temples are now the sole remains of the wonderful Greek civilisation that flourished in these parts. The Temple of Juno Lacinia, erected in the 5th century B.C., a pure type of Doric, was built, he said, as were all the temples at Girgenti or Agrigentum, of a warm yellow and red calcareous stone, which was covered with an extremely thin and fine coating of stucco made of powdered marble, and afterwards painted in the brightest colours with ornamental designs. The Temple of Concord, a little to the west, was one of the best preserved temples in existence, owing to its having been converted in the Middle Ages into the church of "St. Gregory of the Turnips." It was similar in plan to the Temple of Juno, somewhat later, but also belonging to the best period of Doric art. After describing other temples, he said it was difficult to picture in our minds what must have been the effect of these temples in the days of the Greeks—this long succession of noble buildings, situated in one of the most beautiful spots in the world, on the edge of a precipitous ridge, converted by the consummate art of the Greeks into terraces and platforms from which they viewed the sparkling sea beyond. It was unfortunate that we had no remains of the domestic and civil architecture of the Greeks, or of their paintings. However, in tracing the influence of the Greeks on the native tribes of the countries they colonised, they could gather some idea of the Grecian houses and their decorations from what was seen in the town of Pompeii. The most interesting period of the art history of Sicily and Southern Italy commenced with the invasion of the Normans. The architecture of the Normans was quite different to that of Normandy or England. The Norman invaders were warriors, and did not devote themselves at first to the arts. They found the inhabitants of the island Greeks and Saracens, in a high state of civilisation and culture. The Normans employed the Saracens in the building of their churches and palaces; the Saracenic art was again swayed by Byzantine influences. The Normans, however, introduced many features of their native land, so that the result as we saw it was a mixed style of great interest. The first building of the Norman period in Sicily was the Cathedral at Cefalu, erected by Roger in 1131. It was Basilican in type, with the unique feature of twin Norman towers in front. It contained the most beautiful mosaics in Sicily, completed in 1148, of a far higher class of art than the Roman ones of the period. The Capella Palatina in the Royal palace at Palermo was built at the same time as the Cathedral of Cefalu, and the mosaics were little, if any, later. Above a high dado of marble, porphyry, and mosaics, all was gold—the glittering gold of glass mosaic. In the semi-dome of the apse was a great bust of Christ. The whole story of the Old and New Testaments was told in those mosaics in a strikingly simple yet telling manner. Over the crossing, and above golden arches, sprang a low semicircular dome. Mr. Bedford then compared this style of polychromatic decoration with our Northern cathedrals, wherein the windows formed the chief centre of colour, and with the fresco-covered churches of Italy. As to the methods of the mosaic workers of the 12th century, Mr. Bedford said the whites and flesh tints were of calcareous stone, found in the islands, of different shades. All the other colours were of coloured glass; while the gold ground was formed of gold leaf between two sheets of glass fused together, and then cut up into cubes about three-eighths of an inch in size. Concluding, the lecturer said the buildings of Southern Italy and Sicily of this period, although not so great or ambitious as some of our Northern efforts, were of an interesting transitional character, and formed a link between the Eastern and Western worlds.

"THE CARPENTER'S SHOP AT NAZARETH."—PLYMOUTH CO-OPERATIVE AND INDUSTRIAL SOCIETY'S NEW PREMISES. — PERSHORE ABBEY. — HOUSE AT FOREST-ROW, EAST GRINSTEAD.—RYDAL MOUNT SCHOOL, COLWYN BAY.

Our Illustrations.

"THE CARPENTER'S SHOP AT NAZARETH."

The above has been painted by Mr. William Lance for the decoration of St. Mary's School, Wantage, and is a scene in the ordinary household life of the Holy Family. The Child Jesus has reached an age when He can begin to make Himself useful in a humble way to the carpenter of the lineage of David, who stands to Him in the position of a father. He is engaged in sharpening the carpenter's tools that Joseph uses in his trade. As He stands at the grindstone in the open court that forms an important feature of most Syrian houses, His mother, passing to and fro about her household duties, has paused to contemplate the Child, whose birth and character draw forth her reverence as well as affection, though as yet she does not fully realise who and what He is. Jesus ceases His occupation for a moment to place His hand in hers, and to look up into her face with the truthful affection of a child. St. Joseph also, without remitting his vigorous planing at the bench behind, glances at the mother and Son with a dim conception of the mystery of their relationship. The utensils of his trade are kept in an arched recess in a wall of very solid masonry of the hard limestone in which the mountains of Palestine abound, its original white being toned down to a pale yellow by exposure, which, however, has left still visible the salmon-coloured veins which vary its surface. A stone staircase leads from the court to an upper chamber, having a door opening upon the roof, the parapet round which is decorated with the arrangement in triangles of small red pipes, perforating it from side to side, which is everywhere used to give lightness and finish to the tops of walls in Palestine. Against the wall at the back there rest two newly-fashioned implements—a crook and a fishing net, reminding us that He who received "gifts for men" was to be Himself the "Good Shepherd," or Pastor, and the "Fisher of Men" the Evangelist; while He is here engaged in learning the trade of the "Builder," the Apostle. There hovers near Him the Dove, the symbol of prophetic inspiration. The subject has been chosen for the decoration of a schoolroom, as setting forth the beauty and dignity of Labour and Obedience, in the example of the perfect Childhood.

PLYMOUTH CO-OPERATIVE SOCIETY CENTRAL STORES.

These premises, now in course of erection, situate at the corner of Frankfort and Courtenay streets, Plymouth, have a frontage of 126ft. to the former and 146ft. to the latter. They will be entirely occupied by the society for the purposes of their business, and comprise on the ground-floor nine separate shops for various branches of the society's business. On the first-floor will be a general office, 50ft. by 34ft., with manager's office and accessories, and several large show-rooms for furniture, drapery, &c. On the second-floor is a hall about 80ft. by 41ft. for general meetings of the members (who number in the whole about fifteen thousand). It has a large end gallery, also kitchen and serving-room adjoining for dinners and similar entertainments. There will be also on this floor committee-rooms, reading-room, library, and other recreation-rooms and work-rooms. The remaining stories will be principally occupied as work-rooms, store-rooms, and caretaker's apartments. The principal entrance to the hall will be from Courtenay-street by a Portland stone staircase 6ft. wide, and there will be an exit staircase of almost equal dimensions at the other end leading by a corridor into Frankfort-street. The stories are lofty, the ground-floor being 17ft. high, the first-floor 14ft., and the remainder of proportionate height. The hall will be about 35ft. high, and the ceiling will be in three curves, those at the sides springing from the same level as the arches of the windows. The fronts are faced with deep red facing bricks, with Portland stone dressings. The whole of the plinth and pilasters of ground-floor up to a height of 7ft. above the footpath are of polished red Peterhead granite, as are also the jambs of two of the principal doorways; the third doorway (the main entrance to the hall) is entirely of polished red granite. The clock tower rises to a height of 150ft., and will contain a clock with four illuminated dials with Westminster chimes. The general contractor for the work is Mr. A. R. Debnam, of Plymouth. The architect is Mr. Henry J. Snell, of the same town.

PERSHORE ABBEY.

Pershore Abbey was founded either in the year 604, 681, or 689, A.D., preference being given to the last date. It has been several times since then repaired or rebuilt, and the present portions—the choir, south transept, lantern tower, and some chantry chapels—exhibit examples of 11th, 13th, and Early 14th-century work. The 11th-century work is in the south transept, the 13th-century that of the choir, a very beautiful specimen, consisting of four straight angles, and one returning towards the eastern arch at an angle; the piers are delicately shafted and the arches richly moulded. The illustration is of the Lantern Tower, about 40ft. square externally and 30ft. internally, is of Early 14th-century work, attributed by the late Sir Gilbert Scott to the architect of Salisbury Cathedral tower, to which it bears much resemblance, though much plainer in detail. His reasons for this statement we will consider directly. It stands on four lofty Norman arches, springing from massive piers, faced on each side with coupled attached three-quarter shafts having rudely-carved caps, and which probably bore the tower, destroyed by the fire in 1288, of which traces are yet distinctly visible; and, as about half a century after the tower was still spoken of as ruinous, 1330 will not be far wrong for the time about which the present superstructure was commenced. It rises to a height of 60ft. above the arches, and makes the total from the ground about 116ft., and to the top of the modern pinnacles 144ft. Externally, the upper or belfry story, divided from the lower by an embattlemented band (a rare feature in this period), exhibits four canopied arcades of four arches each, slightly recessed behind the angle-stair turrets, and divided by square, pinnacled shafts, which occur in couples in the middle of each face. The central arches are pierced for light; the others are blank; all have mullions and traceried heads. The lantern story has on each side two traceried windows of two lights, the lower portions of which are somewhat awkwardly shut off by the line of the choir, transepts, and nave roofs which rise sharply on either face. The turret of the stair, now crowned with modern pinnacles, added by Sir Gilbert Scott, rose originally only just above the parapet. There exists to the north-east angle of the tower a semi-Classic buttress, which was erected when, not having the support of the north transept, the tower was considered somewhat unsafe. Internally, a lantern of much beauty is displayed, so much so that of it Sir Gilbert said he "hardly knew of a lantern story so beautiful as that at Pershore; it stands," so far as he knew, "quite alone in its design." It is richly panelled and traceried, and is pierced by two passages, one above the other, from the upper of which access is made to a square ringing stage, so arranged as not in any way to interfere with the view of the lantern from the floor of the church. The belfry over contains eight bells—one of the finest peals in England, though surpassed by some of a larger number—cast in 1729, except one, the treble, which dates early in the present century. The tenor is of about $1\frac{1}{2}$ tons weight, and gives the note of D flat. The timber roof over is an old one, but its date is unknown. There is no provision for a spire, and though it has been suggested as the original intention, it does not seem very probable, except that perhaps a wooden one might have been used.

Francis B. Andrews, A.R.I.B.A.

HOUSE AT FOREST-ROW, EAST GRINSTEAD.

This house is now in course of erection upon a beautiful site overlooking Ashdown Forest. The walls up to first floor are built hollow faced with the local sandstone, the upper portion is in half-timbered work, filled in with brick cemented on face, and the roof is covered with brown Broseley tiles. Mr. Sidney A. Ell, A.R.I.B.A., of East Grinstead, is the architect, and the work is being carried out by Mr. Job Luxford, of Forest-row.

RYDAL MOUNT SCHOOL, COLWYN BAY, NORTH WALES.

The rapid and increasing success which has attended the above school under the *régime* of its popular head master, Mr. T. G. Osborn, M.A., J.P., together with the lapsing of the lease of one of the schoolhouses, has necessitated the additions which we illustrate to-day. The recently erected buildings comprise a new schoolroom, 46ft. by 24ft. (exclusive of bay), a dining hall. 44ft. by 22ft. (with service from kitchens), a master's room, several art and other classrooms, boys' changing room, lavatories, and the various accessories necessary to a large private school, including provision for a laboratory. In the upper floors extensive bedroom accommodation is provided for both boys and masters, the rooms for the latter (which are arranged as sitting and bedroom combined) being planned so as to command the boys' bedrooms on either side. A sanitary block, &c., is provided near, and yet separate from, main building, and special attention has been paid to the ventilation and drainage of the school buildings generally. The style of the new portion has necessarily been influenced to a great extent by the existing buildings, but a somewhat more scholastic character has been introduced in the new work, which has been executed from the designs, and under the superintendence of, the architect, Mr. T. E. Lidiard James, of Lonsdale Chambers, 27, Chancery-lane, London. In connection with the school there exists another house to the north of the main building, near which are situated a well-appointed school workshop, and also, at some distance from the school, the sanatorium. The new buildings were formally opened last June by the Rev. Dr. Moulton, principal of the Leys School, Cambridge, and president of the Wesleyan Conference. The external facing of the work is of Yorkshire stone, from Shepley, near Huddersfield, matching the older part, with Cefn-stone dressings. The builder was Mr. J. Berth Jones, of Llanrwst, and the clerk of works Mr. George Malpass, of Sheffield.

◆

A fresh disaster occurred on Monday to the Manchester Ship Canal works. The tide burst in Bridgewater Lock, which is intended to work the port of Runcorn, and a breach of 200ft. wide was made. The brickwork, 5ft. thick, was thrown down, much plant is submerged, and three men were drowned. The lock was approaching completion, and the damage is estimated at about £5,000.

St. Matthew's Church, Horsley Fields, Wolverhampton, was reopened last week after undergoing extensive alterations and renovation. The improvements include the insertion of a large four-light stone-mullioned window at the west end of the nave. The old organ has been removed, and pews are erected in its place, while a new organ is built in a chamber formerly used as a vestry. The chancel floor is raised 1ft., extended 7ft. into the nave, and laid with encaustic tiles, approached by Yorkshire-stone steps. A new pulpit and a reading-desk are placed at the end of the chancel floor. The church is repewed throughout with pitchpine seats, while the roof has been revarnished and the walls recoloured. The new organ was built by Messrs. H. Pickett and Son, and the structural alterations were done by Mr. E. Marchant, Ettingshall, from the plans of Messrs. C. Manton and Son.

WAYSIDE NOTES.

It is a remarkable thing, considering the progress that we have made, or that we supposed we had made, in the science of ventilation, that a medical man should have recently exclaimed to a gentleman who was sounding him on the subject of cold-catching after church-going, "Oh! yes; the church, the chapel, and the teapot are our best friends." One usually imagines that nowadays churches are heated and ventilated to perfection, and chapels likewise, and that, therefore, no more risk should be run in leaving such buildings than in quitting the domestic roof; but a letter from "Fresh Air" in a recent issue of the *Standard*, reminds us that all may not experience the same sense of satisfaction in the things that be. The writer stigmatises our churches as "little better than death-traps." If so, then what are the theatres? As a rule, a church is vastly better heated and ventilated than a theatre, and a public hall or concert-room is generally worse than either. But I think our friend has a good deal of justification for his complaint, and for condemning the ventilation of many churches. It is sufficient to call to mind how many and various are the systems of warming and purifying the atmosphere of public buildings—churches more particularly—to understand that they cannot all be right, unless, indeed, the laws of nature can be set at defiance. If, therefore, *some* plans for heating and ventilating are in harmony with natural forces, it stands to reason that those on a different system must be a delusion. There being so many considerations to be made in dealing with broken interiors like churches, irregular in plan and varied in sectional heights, their ventilation is naturally difficult compared with that of a box-like room. Yet how many treatises have been published on heating and ventilation! We shall soon have to obtain the sanction of Parliament to a regulation whereby everyone entering the architectural, engineering, and allied professions and callings, shall be submitted to a rigorous examination, and if he shows signs of developing into a writer of matter relating to heating and ventilation, shall be bound over to "keep the peace," or be otherwise vigorously dealt with.

A new prophet has arisen who knows not "style." At last the question that has puzzled the grey-heads of generations has been solved. What is "style" in architecture? "There is no such thing" says Mr. E. F. C. Clarke in the contemporary number of *A. A. Notes.* "In olden times there was *growth*, and in our time there is 'fashion,' as in hats and bonnets. It is now 'Classic' versus 'Gothic,' 'Early' versus 'Late,' 'school' versus 'school.'" Mr. Clarke refers to "the astounding pile of monastic eccentricities known as the 'Royal Courts of Justice'" to "wrong-headed Burges," and again to "the sad heap of stray limbs of a dead past gathered together in the Strand." But further on in the paper I am right glad to find a champion of a "stubborn and absolute return to *first principles*," and a plea for "mass, simplicity, purpose, and, above all, *reverence*, that highest of qualities so fast disappearing from all human thought and all human life." This is good, and we may be tempted to overlook much of the patronising of Burges and Street in one who sees the crying necessity of the architectural age for more light on the first principles of design.

A note in *A.A. Notes* points out that the attendance at the ordinary meetings of the Association is not what it should be. From some indefinable reason the average attendance during recent years has diminished. It is pointed out that whereas in the olden time it was often difficult to find standing room, now there are generally seats to spare. Certainly I never remember so meagre an attendance as when Mr. Goldsmith, the genial secretary, read Mr. Westlake's paper, with the sole exception of the meeting a fortnight before, when Professor Garnett came all the way from Newcastle to give, in concise form, the results of his ripe experience in the arrrangement of technical schools, to what was literally a beggarly array of empty benches. As the character of the papers have certainly not deteriorated, it is difficult to assign any plausible reason to this decrease in attendance of members. It is suggested that the increase in the amount of student's work may have something to do with the falling-off of attendance at the ordinary meetings, the students taking Friday as a "night off," and trusting to their "B. N." for reports of the papers read. If this is really the case, it is a pity, because however useful the report of a paper may be to those who are absolutely prevented from attending the meeting, it is greatly to the advantage of a student to attend the actual reading, so that he may make the most of the opportunity of seeing drawings, &c., exhibited in connection with the lecture. As I write I read on the next note, and find that the writer argues in precisely the same way, and further suggests "that the opportunity of hearing eminent specialists upon questions hardly dealt with in the curriculum is not to be lightly disregarded," and that the occasion is also a very valuable one for cultivating the art of public speaking, which will be valued when in future years the young architect has to stand up before building committees.

Committees are dreadful facts to face. I was told some days ago of an incidental occurrence that shows the pettinesses of which they may be capable. Several members of a building committee were inspecting the progress of a public work, my friend, the architect, accompanying them. On a discussion occurring as to the best way of carrying out some minor detail, a suggestion was made; whereupon Mr. Buttertub *loq.*:—"Oh, we can't do that, *it will be carrying out Jones's idea!*"

None of us, in the general way, care to "carry out Jones's idea," but when the public interest is at stake private jealousies and contentions should be set aside. And as to committees, the evil of them does not rest at petty differences. Among others with whom the architect has to contend, there is the pig-headed member, and the matter-of-fact, over-economical gentleman, who wants to spoil the ship for the ha'porth of tar, the man who "knows something about building," the amateur architect who likes "the Gothic" manner, and is generally supposed by the other members of the committee to possess a knowledge of matters architectural of unfathomable depth; and not infrequently our old friend Mr. Buggins himself may be found in committee, airing his views on drains and stink-traps, and generally making himself objectionable. To meet and argue, reason, and confute with such a company require a good deal of "gab"; and if this is not a gift such as old George Stephenson coveted, it must be acquired by practice. The young architect will in after years consider that by constant attendance at meetings like those of the Association, and studied efforts at elocutionary excellence, he has very cheaply acquired an invaluable accomplishment. In these days of competitions, every one is liable to find himself face to face with a sceptical, exacting committee, and it behoves all to prepare for the contingency.

At the fifteenth annual dinner of the men portion of the choir of St. Paul's Cathedral, Canon Scott-Holland, who presided, explained the works now in progress and contemplated for the decoration of the Cathedral. Mr. Richmond has agreed to devote three years to the work of decorating the spandrels and smaller domes of the choir in mosaic, part of the scheme being now well advanced. Mr. Penrose is preparing to substitute statues for the imitations now above the whispering gallery, and for decorating the alcoves above the arches carrying the dome, the spandrels of which are now in course of completion in mosaic. Messrs. Bodley and Garner are preparing a scheme for the better treatment of the font, and placing a marble canopy on it; and Mr. Gilbert has undertaken to design two candelabra for the western entrance, in lieu of the unsightly gas-lamps. This all seems to me good; but so diverse are opinions concerning what ought to be done in the matter of the decoration of St. Paul's, that it cannot be expected to please all.

The parties seem of two distinct orders, each with their respective creeds. On the one hand, we have the purists, and the other party comprises such as believe that as the cathedral interior now stands it is cold and bald. They may be called the "ornamentists." The purist party is divisible into sections, according as the individual members are against innovations on religious and puritanical grounds, or for artistic reasons. To the religious party I give little consideration, they having shown their cast of mind in the reredos case; the architectural purists have usually my favour in regard to well-designed Gothic church interiors; but there is something about the interior of St. Paul's Cathedral that gives me sympathy with the ornamentists in the present question. So long as the idea of plastering over every square inch of the interior of the cathedral with colour or decoration, as a plasterer papers and limewhites the walls and ceiling of a house, is forsaken, the efforts at rendering the interior more inviting and interesting must meet with success. And I believe that so far as the Dean and Chapter have carried their work, they have been successful, while the works foreshadowed by Canon Scott-Holland, in the decoration of the choir, the provision of a font canopy, the substitution of real statues for false, and the erection of candelabra by Gilbert, will all help on towards the desired end.

Goth.

THE SURVEYORS' INSTITUTION.

Of the candidates who presented themselves at the preliminary examination of the Institution, held concurrently in London and Manchester on the 26th and 27th ult., the following satisfied the examiners:—

Gerald James Frederick Adams, Henry Charles Adams, Alan Arnold, Percy Charles Beasley, George Beken, jun., Herbert Owen Bell, Frederic Roger Betenson, Raphael Bonella, Alexander Bruce, Charles V. Cable, Sydney George Carnell, Alfred Stott Cartwright, James Arthur Chubb, John Whitehead Clayton, Robert Wm. Clutterbuck, Herbert Lee Cowell, William Shapland Cowper, Herbert Henry Crawford, Stanley Johnstone Cribb, Dixon Bowring Davies, Walter Jackson Davies, George Plant Deeley, Edward Aubrey Deer, Clement Robert Finch, Hugh Ernest Folkes, John Stanley Garner, Henry Alexander Glover, Chas. Henry Godfrey, William Harris, William Rook Hicks, William Hindes Hull, *William Jarmain, Douglas Harold Jeboult, William Thomas Lamprill, Walter Burditt Leane, Sydney Burton Lee, Francis Prideaux Lightfoot, Edward Covill Lyons, Frederick Chas. Thomas Mann, Alfred John Martin, Thomas Charles Nevett, Harry Alfred Newbronner, Stanly Hatch Page, William Henry Pain, Walter Parks, John William Paul, John Arthur Peppercorn, Francis John Phillips, Frederick Fleet Rootham, Charles Sidney Sandford, Alfred Sydney Edward Sedgwick, Henry Edward Bygrave Sewell, Arthur Percival Skeat, Alfred Charles Skingle, Alexander George Smith, Rupert Wyatt Smith, Arthur Carnegie Standen, Chas. Walter Stupart, William Selves Walker. Herbert John Watson, Herbert Bateson Whitby, Sidney Algernon Wilde.

* Passed at head of list.

CHIPS.

The top stone or finial of the main gable of the new Wesleyan Chapel, Penryn, Cornwall, was set on Monday. The granite work of the building has been executed by Messrs. Freeman and Sons. Mr. Arthur Carkeek, of Redruth, was the contractor; Mr. J. Wm. Trounson, F.R.I.B.A., F.S.I., being the architect.

The death is announced of Mr. John Edward Price, F.S.A., of Leytonstone, the secretary of the London and Middlesex Archæological Society. Mr. Price, who was in his 52nd year, was the leading and most reliable authority on Roman relics in London, and had done good service in connection with the acquisition and arrangement of the contents of the Museum at the City Guildhall.

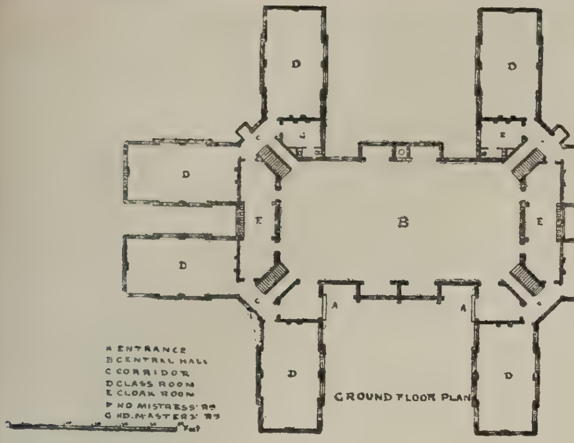
In the case of the application for an order of discharge from bankruptcy, made by Walter William Neal, of Newfoundpool, late of Leicester, builder, the discharge has been suspended for nine months, ending April 21st.

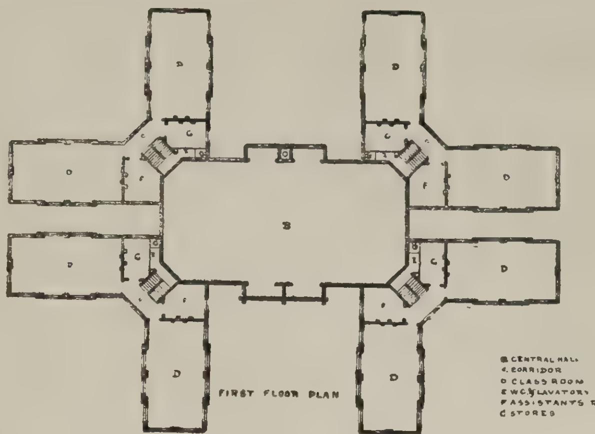
The promoters of the Waterloo and Royal Exchange Railway have decided not to proceed any further with this scheme during the ensuing session of Parliament.

The Glasgow police commissioners appointed on Monday Mr. Thomas Nisbet, C.E., as assistant master of works, at a commencing salary of £300 a year.

A village hall was opened at Llansaintffraid last week. The hall is seated for 300 persons, and has been rebuilt from designs by Mr. E. B. Smith, of Oswestry, the contractor being Mr. David Mason, of Llansaintffraid.

At Daphne excavations have been begun by the Athenian Archæological Society, with the object of bringing to light the *via sacra* of Eleusis and the remains of the sanctuaries of Apollo, of Athena, of Demeter and Kore, and of Aphrodite, which known to have existed in that neighbourhood.





PATENTED PLANS FOR THE IMPROVEMENT OF SCHOOLS.

MR. THOMAS HUGHES has produced this patent arrangement illustrated above, with a view of isolating the several class-rooms, of either a large or small school, so as to secure thorough ventilation and light, each class-room being made of easy access either from the central hall or the exterior of the building. The accompanying drawing shows class-room accommodation for 1,200 children, there being 16 class-rooms, D, each 40ft. by 20ft., leading from a central hall, B, 90ft. by 45ft. There are also head-master's and head-mistress's private rooms, E and G, size 14ft. by 10ft., with w.c. and lavatory accommodation to each. On the first floor there are four private rooms, 14ft. by 14ft., and four other rooms, G, 14ft. by 10ft., which rooms are intended for assistants' private rooms and store-rooms. There are also four private w.c.'s and avatories, one from each staircase landing. On the ground floor at each end of the central hall s placed a cloak-room E, size 45ft. by 14ft., divided into two compartments by a wooden screen. There are also six wash-hand basins to each cloak-room, three on each side of the partition. The staircases, C, four in number, are 4ft. wide n the clear, and the staircase corridors are 4ft. and 8ft. respectively. The amount of land covered by the school buildings is about ,744sq.yds, the extreme length of the building being 68yds. 2ft., and the width 53yds. 2ft. This ystem can be adapted to suit various sites ccording to requirements, and the central hall an be built either octagonal or oblong. The atentee claims that the cost of building will ompare very favourably with the cost of schools s erected at the present time.

* * *

THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. F. T. Baggallay, in the chair. The following new members were elected: Messrs. C. H. hewlis, W. Hearn, G. B. Goslin, F. G. Hunt, and R. V. Hunt.

ASHIONS IN ARCHITECTURE AND KINDRED ARTS.

A paper on this subject, written by Mr. . H. J. Westlake, was read in the author's bsence through ill-health by Mr. Goldsmith, on. sec. Mr. Westlake proposed to epitomise me of the differences of style that fashion had, om time to time, adopted during the present ntury, and to follow this by putting certain opositions before the members as the causes of e rapidity of these changes in recent years, ncluding by attempting to show how all this ight be worked to a good purpose. We are all us, the author continued, continually told by ose who claim to be men of "light and leadg" what is *the* thing, especially in the way of yle. Notwithstanding this, we have seen somemes the same leader change, from a dogmatic herence in preaching the imitation of some cient style, because of some supposed or real bjective value that its characteristics enshrine, d, altering his opinion, use the same arguments favour of another, and finally, perhaps, boldly inquishing his line of argument, opinions and , in favour of this, advocate something entirely ferent. The cause of this is difficult to exin. Often it is because some architect or artist, having made a success and a reputation in another style to that formerly in vogue, has attracted many followers, thus forcing a change of fashion, and your man of "light and leading" is fashionable in his opinions, or nothing. We are forced to ask ourselves this question: Why during the last century the changes in architecture and the kindred arts have become rather those of fashion than of style, and why we now have no distinctive style proper to this great period—no style which embodies a real religious or national character, and why for a certain short period we design in any adaptation of either of the old styles and then discard it for another? Could any method of enshrining a beautiful idea in architecture or art be more inviting than that of the Adelphi Adams and the period of Reynolds, of Flaxman, of the Wedgwoods, and all the eminent men of that time? Can you on looking back see any reason why such a fashion ceased, and that shown in the Houses of Parliament for a time arose, and Pugin, Sir C. Barry, and kindred artists were in vogue? We all know Pugin's arguments in favour of the Gothic revival. One of the most celebrated art thinkers and writers that ever arose, whilst in some respects following the same line of thought as Mr. Pugin, said hard things about him and the "Houses." I allude to Mr. Ruskin, who has been a power in the influence that at one time changed the mode of thought and fashion in art. The action of the Royal Academy during the century has been rather that of a body with an unsettled purpose. In its early days composition, design, and the more intellectual branches of the art were represented. Amongst its roll of members we often find the names of eminent composer-artists, such as Flaxman, Maclise, and Dyce. The main object of the majority seems to have been simply to encourage mechanical and technical excellence, until quite recently, under the present President, who, with some few others, has encouraged the study of the architectonic arts. The Academy has not, however (notwithstanding the recent advances in the architectural school), as yet during the present century shown us even the elements of a school of national artist-composers, great as some of its individuals are in separate branches of art. About half a century ago there arose the School of Design in South Kensington, but I cannot think the influence of that expensive machine has been other than dangerous at times. It has given us cheap drawing schools; but is national design, as national design, developed at all in proportion to the influence of the great and expensive machinery? As nearly all modern developments and improvements are from minds that were outside its influence, I cannot consider it a large factor in the changes that have taken place. Many of us can recollect the influence that the Lille competition and the publication of Viollet le Duc's dictionary had for a period on our fashions. The Early French style adopted by Burges and Clutton—the successful competitors for Lille Cathedral—began to dominate, and adaptations of this style became so prevalent that nearly every architect practised it more or less. We all know of work in that style by Clutton, by Burges (who never entirely deserted it), by Street, and by a host of followers, with a result that was lamentable; for the host of followers seem to have delighted in the eccentricities, rather than the merits, of the style, and many of the arts were involved in its study and practice for a considerable period. Later on, the competition for the Law Courts perhaps did much to produce a change in this, and we saw many of the competitors working from English models, although the successful architect never completely escaped from his French "convictions." The youngest of us have seen through the change, from Decorated to Perpendicular, the devotion to the so-called Jacobean and Queen Anne, and our present rising fancy, if there is one dominant, for a mixed Renaissance of a very indefinite character. This brings me to the second part of my subject. Why have these changes taken place? Why, if one of the antique styles did for centuries, and one of the Mediæval styles for one hundred years, and was consequent and consonant to its predecessor, must we have now twenty or thirty different, and often incongruous, styles adopted in the same period? What is the cause, not the accidental—but the essential—cause of this? Is it that there is no dominant national or religious character to enshrine, no dominant thought requiring a dominant idiom, no great and leading poetical aspiration in us, no really important idea for us as a nation to represent? So that we have fallen from the regions of the ideal, and are become more professional men and few poets! For architecture and art in their perfection are but concrete renderings of the author's finer imaginings. The language, the idiom in which he spoke in ancient days, embodied an idea of which he was a part—it was almost a "chironomia"—and we even now, when gazing at times on these ancient works, seem to feel the author's emotions, and to be inspired by the same sublime ideas. We appreciate at evening the grand outlines of their buildings as they appear like dreams, their masses showing dimly against the setting sun, and in the daylight we dwell on the sweet intentions or bold determination of their details or mouldings. We read their language, but have little occasion to speak it as they spoke it, and too great a love of various knowledge to limit ourselves as they were limited—to the perfect expression of a few ideas: we forget that in this limitation of action there is an increase of power. My argument may thus be condensed—the higher architecture is an art, and like the other arts is a language for the expression of thought; in this it distinguishes itself entirely from the science of building; perhaps to many my definition would be more acceptable if I were to say that it is a language combining science and art. In ancient times it expressed the ideas of the period in the idiom of the period. In these times what is its position, what expression of living national or local idea is there in the Houses of Parliament, the Law Courts, the Meat Market, in the various new Board schools, or workhouses? You may answer, little; but tell me to look to the railways and their stations, the City warehouses, and those real expressions of living national architecture, the ships; but for my own part, in these last only do I find what I desiderate. If, then, there is neither dominant idea nor dominant idiom, what is the architect to do? and the most rational answer to this, in my own mind, is that he must either express his own ideas, embody his own fancies, or represent the ideas of some living energy to which his mind is affiliated. When I said that we were now more professional men than poets, it was not my intention to imply that there are no poets left—no architects whose works speak of their nobility of aspiration or intelligence. Far from it. There are some few. It would be invidious to choose examples amongst the living; but I may mention the names of two who have not long passed away, and with whom I was intimate; and they had minds so full of sympathy and intelligence that they would have been marked men, no matter in what method they expressed themselves. I allude to Burges and Sedding, and I take them as exponents of the two ideas I have mentioned—Burges of the first, and Sedding of the second. Burges imbued his sensitive and poetical mind in Mediæval lore; he was almost at home in its ideas when an accident led him to study Early French architecture, and he learnt to speak in an idiom of his own formed upon that basis. He cared not to speak much in any other way; if he did, he did it with that difficulty with which one speaks a foreign tongue, and you all know at sight Burges's works, and from them Burges's ideas; they are not more than an individual expression, but they expressed the man, his intelligence, his great information, his power of adapting that information, and his poetical disposition. Sedding affords us a complete contrast; intelligent, fairly learned, of a refined and poetical mind, he rather represented an idea than himself. He did not work long enough in any style to form for his own use a distinct idiom, although he managed by his ability and sympathy to express himself in many ways; his individuality was never so apparent in his work as was that of Burges. This, then, is the highest point in which the architectural arts can now aspire as national arts. What might be done by the nation, or even by the City of London, or the various large parishes, is one thing—what might be done had they unity and honesty of purpose is magnificent to think of; but what is done amounts to little more than a series of jobs in which those capable of intrigue have had far greater chances than men of reflective, conscientious, and poetical dispositions. Look at the majority of public buildings, the workhouses, and the Board schools, and tell me, do they represent in any way the best or the second-best architectural genius of their period? You, who can form a fair opinion, tell me, am I right or wrong? Returning, then, to my subject, I fear this change of fashion, then, is unavoidable; we shall not have a 19th-century style. The era will pass without any distinct architectural expression like the period of a nation, if such a society can be so-called, of mixed languages. But what are the advantages of this disadvantageous position, as we are soon to enter a new era—the 20th century? History never repeats itself, yet its life and ideas are the products of its predecessors. Most of you will agree with me now in the statement that this is the first century in the history of the world's civilisation unmarked by any dominant architectural style. If the history of a country is written in its monuments, what will the historians of future centuries say of this? Will they be right in saying that it was a century of "Fashion," of vacillating thought and of changing or unsettled purpose, in which everything was tried and nothing stuck to? One cannot tell, but this we know, that if as a nation, as a people, we have made no great and distinct monumental mark, as individuals we may still have character and purpose. Perhaps, then, as a necessity of the position in which we live, if we differ in our characters and purposes, the great knowledge of the various styles which have been diffused by the successive study of them will be of some use to us and to coming men, from which each mind can adopt that best suited to its bent. Wren and Inigo Jones did this as Burges and as Pugin did. Moreover, this knowledge of the character and the details of each style enables us by comparison to form a clear and intelligent knowledge of the capacities of each, as though we could speak many languages and choose that which best expresses our thoughts, even if we lacked a mother tongue. Of course, a mind allied to very firm convictions and of a strong character may, out of this knowledge, evolve a style which may embrace the thoughts of an age, and become that of a coming era, but, as yet, we are looking for this mind. At any rate, when such a one arises there is a vast store of knowledge in the art literature of this century, so collected and ordered that he will not require mental food. He will have this advantage over those who have preceded him, in any period, for never has there been so vast a storehouse, nor so much accumulated store, so readily obtainable, and to this cyclopædic accumulated store of art knowledge the Architectural Association has been no small contributor.

A brief discussion followed, in which Messrs. Owen Fleming, Paul Waterhouse, C. H. Brodie, Leonard Stokes, F. T. W. Goldsmith, and E. Woodthorpe took part, and a vote of thanks was accorded to the author and reader of the paper.

HOSPITALS AND ASYLUMS.*

IN our recent remarks on asylum construction, we alluded to the very scanty information extant on this class of buildings that would be of any service to an architect. Since they appeared, a work of a comprehensive character has been published, which supplies, to some extent, the requirements of the profession. Mr. Henry C. Burdett, the author, formerly secretary and superintendent of the Queen's Hospital, Birmingham, and for twenty-five years engaged in hospital and asylum administration, has presented the public with the results of his experience in the shape of two handsomely-printed volumes, which give a comprehensive history of the subject, besides plans of some of the principal asylums in this country. These have been classified and arranged according to type, and are drawn to one scale. If we do not agree with some of the recommendations and suggestions given, we are willing to admit the scientific and medical facts and principles have been well summarised, and the work will be of value to those who want a record of accepted facts and examples. We must content ourselves with giving our readers a mere synopsis of the first volume, a very bulky one of 681 pages, which, like the second volume, deals with asylums, their history, and administration. The first chapters on the former treatment of lunatics are instructive; and the historical narrative is divided into the ancient period, the period of demoniacal possession, from 600 to 1750, the period of brutal suppression and ill-treatment of lunatics, from the latter date till 1850. Mr. Burdett's account of the second and third periods reveals a very inhuman and cruel method of treatment of the insane. Even ancient writers like Soranus, who lived a few years before the reign of Trajan, speak of the methods to be used, and which rather tended to assuage and appease than to irritate or frighten the patients, such as being kept in dark places, restrained by bodily force, and even tortured by cruel devices. The other portions of the volume deal with the history of lunacy and asylum treatment in the colonies and abroad, and the present condition of asylums throughout the world.

The second volume is more practical, and deals with asylum construction. Referring to site, many useful hints are given. For an asylum of about 600 beds, a site of 50 or 60 acres is found sufficient. Subsoil drainage is absolutely necessary where the soil is not gravel. Speaking of position, the author recommends a rather sheltered situation—a point upon which medical opinions will probably differ, as many of our English asylums are built on high ground rather exposed. The chapter on instructions to architects is of value; the author thinks open competition is the most promising system, if proper conditions are made imperative. Committees should state their ideas clearly, and among the points to mention are the type of asylum required, whether it is to be in blocks or on the corridor system, or a mixture of these; the number of blocks; method of warming, light, and ventilation; the number of beds, and the entire space for each; number of single rooms; if private patients are to be provided for; materials, style. We agree that a committee of architects and medical superintendents of asylums is the best body to adjudicate on the plans.

The main principles of construction are stated, and the following are a few that will be accepted: That the building should be constructed on some modification of the block principle; it should not exceed two stories in height; the floor of each block should contain dormitory space sufficient for those patients who occupy its day-rooms; that the corridors should be of two stories and fireproof, including staircases; access to any ward without passing through any other; single-bedded rooms should be provided to accommodate at least one-fourth of the patients, and should contain at least 800c.ft. each, with at least 80sq.ft. of floor; in the infirm ward as many as possible of the single rooms should open from day-room; hence the value of the gallery form of ward for an infirmary; minimum day and night space should be 600 cubic ft. to each patient—*i.e.*, a floor-space of 60sq.ft.; where there are separate dining rooms and recreation hall the day-room space may be reduced to 500c.ft., except in the infirm ward; each ward should have its own dining room, which should be an addition to the day-room space. Several other points are enumerated. The author recommends a modification of the French casement for day-room and dormitory windows, the upper part being an oblong hopper opening inwards from the transom bar, the lower part divided by a large mullion, with swivel hung sashes in each division. These certainly look better, and are stronger than ordinary sash windows, and there are no sash-weights and lines. Plain architraves and shelves for flower-pots are desirable, and the stone sills of windows should not be more than 2ft. 9in. from floor. Single rooms should have battened shutters securely hinged, and the lining should be extra strong. Blinds should be provided to day and dormitory windows, and a good, durable kind is wanted. As regards doors, the six-panelled is thought to be the best for day-rooms and dormitories, the upper panels being filled with strong glass plate in outer doors. For single-room doors the top panels may be left open. Some of them may have shutters. Flush-out closets without casings are recommended.

The administrative department is first discussed, each of the departments being specially treated. Generally the asylum has a southern aspect, with the recreation courts in front, and the entrance to the north, so as not be overlooked from the wards; but this disposition prevents, as the author says, the main elevation from being seen. A plate is engraved of a model plan for 750 patients, showing the official portion: the superintendent's block comes first, with clerk's office and sitting-rooms, with committee and bedrooms over for assistant medical officers. A short corridor joins this block with the main building, where are two receiving rooms for males and females, one on either side of corridor. The north longitudinal corridor here cuts across the block, from which the surgery and pathological rooms open. These form the north end of the main central block between corridors on the male and female sides. Between these follow in order an open court, then a large general store from side to side, with access from each corridor, with meat safe. Open courts divide the store from the kitchen department, with its surrounding offices, servants' mess-rooms, and bedrooms over. Two more open courts separate the kitchen from the store and housekeeper's rooms, and, lastly, at the south end is the recreation hall, 70ft. by 50ft., with dressing-rooms and chapel above. In a similar manner descriptions and plans follow of the laundry departments, and some useful remarks are made of the requirements. The hospital buildings are fully dealt with, and model plans are given of the infirm blocks. The plan consists of a long gallery, with day-room projecting in the centre towards the south, with twelve single rooms arranged along the north side. A small dormitory projects at each end of the galleried-day-room on south side, and a large dormitory block runs northward on the same axis as the day-room, thus forming a cruciform arrangement. At each end of the ward gallery the window is bayed. The nurses' rooms are placed at the ends of the single-room ranges in each case. A laboratory and bath-room projects from the large dormitory. The infirm are placed on the ground floor and the convalescent above. The author prefers the plan of giving patients their meals in rooms attached to their wards, and this plan is no doubt best. He remarks, and it is worth notice, that the architect's classification of wards is not often adhered to by the medical staff, who adopt their own classification. The plans are drawn to a scale of 1in. to 60ft.

An asylum for 300 beds is illustrated resembling that of the borough of Derby, built with blocks in quadrangle form on the corridor-pavilion plan. In addition to the model plans, plans are given of the Hereford City and County Asylum on the corridor principle, with wide galleries and centre bays; the Elgin, Illinois, Hospital on the linear system; the Gloucestershire Second County

---

* Hospitals and Asylums of the World, &c. By Henry C. Burdett. In two vols. London: J. and A. Churchill, New Burlington-street.

Asylum, by Messrs. Giles, Gough, and Trollope, on the broad arrow pavilion system, partly constructed; the Norwich Lunatic Asylum, by Mr. R. M. Phipson; and large plans of the Claybury Asylum, Woodford, Essex, by Mr. George J. Hine, illustrated by us. These several types of asylum are described by reference to existing examples, full lists of which are given in every country of the world. Four leading types are enumerated, though these often merge into one another—viz., the irregular or conglomerate, the corridor, the pavilion, and the corridor-pavilion. Asylum construction in France and in Germany is treated in separate chapters, and the author deals with warming, ventilation, and lighting; and for asylums he thinks the high-pressure system of heating the best. Drainage, detached infectious diseases hospitals, asylum furniture and decoration, and irrigation are also subjects dealt with. The appendix gives the report of the Committee of the London County Council on a hospital for the insane, the evidence given on which is of value.

BOOKS RECEIVED.

A Manual of Instruction in the Art of Brass Repoussé for Amateurs, by GAWTHORP, illustrated (London: Drowley and Co., Ludgate-hill), will be found a useful manual for amateurs in the art of *repoussé* work, the author, who is a practical artificer in brass and iron, endeavouring to explain the methods used by craftsmen in this ancient art. The mode of beginning, tracing, or outlining, grounding or matting, raising, finishing textures, background, and other operations are all practically explained. The tools required, and the appliances, the backing of plastic materials, a compound of pitch for giving shape to the metal, a spirit blow-lamp, bench, &c., are described.——The *Essex Review* (Chelmsford: Edmund Durrant and Co.; London: T. Fisher Unwin) is the first part of a quarterly journal for the county, which is intended to relate to matters of interest in the local life-history and literature of Essex; to collect facts, and conserve materials. This part has a readable article on Essex churches; St. Augustine's, Birdbrook, is described and illustrated by Mr. Fred Chancellor, J.P., F.R.I.B.A. An article on an appeal case in the House of Lords, as to the right of the Crown to the foreshore known as the Maplin Sands; a paper on Waltham Abbey, by I. Chalkley Gould; the Housing of the Agricultural Labourer in Essex, Notes and Queries, &c., form part of the present number, from which we should predict a large circulation among the county gentry. The Review is edited by Mr. Edward A. Fitch, F.S.A., assisted by W. H. Dalton, F.G.S., and several important contributions are promised.——*The London and Middlesex Notebook*, edited by N. P. W. PHILLIMORE, M.A., B.C.L., is devoted to local history and antiquities of the cities of London and Westminster, and the county. The contents of the fourth number are varied, and contain interesting notes on a perforated stone hammer of rare type from Hammersmith; Drift implements from Marylebone; the Prebendal Manor House, Chiswick; Flemish brasses; the Great Fire of 1666; Canonbury Tower, Islington, &c.——*Examples of Mosaic Pavings from Rubbings of Floors at Pompeii and Venice, &c.*, by ARTHUR T. BOLTON, A.R.I.B.A. (London: B. T. Batsford, High Holborn.)—This is a large volume of examples from some of the best remains. The author rightly emphasises the cube formation of mosaic; the plates are half full size reductions of tracings from rubbings, by which the joints and cubes are correctly shown with the irregularities. The brief introductory essay is interesting as an attempt to trace the history of the art and its origin; and no doubt entire rubbings of mosaics furnish us with the only correct mode of classifying the examples. Four classes are dealt with, and those are divided into two, thus:—

Opus Tesselatum } used in pavements.
,, Sectile }
Opus Figlinum } used in walls and vaults.
,, Vermiculatum }

These are separately described. The book is devoted mainly to the first of these classes—the Opus Tesselatum. Of course the best material for mosaic is marble, though glass and enamel are used in Venetian pavings; and these glass cubes were usually in strong brilliant colours, while the marble cubes were in low tones. Some useful remarks are made on the manufacture, forming beds, and laying. The author complains naturally of the over-close fitting of the cubes, and of the mechanical modes used in copying. Conventional treatment and design are essential, such as the elaborate Greek borders and patterns, or the Mediæval diapers; sudden curves are objectionable, and designs are seldom pleasing. The author acknowledges the encouragement he has received from Mr. Ewan Christian, R.I.B.A., for his consent to publish drawings made for him; also to Mr. Brindley for the suggestion to print the examples in toned ink which very closely resembles the low tones of the originals. Twelve plates are given. No. I. represents a variety of key plans to ½in. scale, which enables us to realise the variety of scale of the patterns, as in those of the Baths of Caracalla with those from Palermo. The latter are very finely worked. Full-size details are given of one of those in the next plate, representing a Roman mosaic from Pompeii, a border and centre. In III. we have a fine detail of a man swimming, a Roman example from the bathroom in the House of Mars and Venus, Pompeii. No. V. is the fret border from the same bathroom. The Wild Boar from the House of that name, plate VI., is a well-known and beautiful mosaic, the ground and pattern most skilfully combined. The Tablinum of the same house has a very excellent design, forming a guilloche in the border, and the interlaced basket or rectilinear pattern on plate VII. Other plates represent a pavement in the House of Sallust, also a rectilinear pattern based on an octagon separated by squares; a hexagon pattern from Pompeii; one in the House of Holconius, of four colours, a kind of Greek key pattern; a Venetian mosaic of glass cubes from St. Mark's, and a pavement from Church of St. Donato, Murano, a peacock in enamel cubes. These plates are artistically printed, and the examples will be valuable to all who design and work in mosaic.

CHIPS.

The new mosaic work and marble steps in front of the altar and altar rails of the parish church of Epsom were dedicated on Sunday. The five steps are Vert des Alpes marble, and were worked in Italy. The altar rails are in carved oak. The mosaic work has been carried out by Mr. Rust, of Southampton-road, London, and the remainder of the work by the contractors for the restoration, Messrs. Longley. The whole of the work has been designed by Sir Arthur Blomfield. The mosaic and steps form the last portion of the church restoration, and have cost £175.

A picture by Scott Lauder, R.S.A., has just been presented to the permanent collection in the Victoria Art Galleries, Dundee, by Mr. A. J. Buist, merchant and millspinner.

The London County Council have appointed Dr. W. H. Hamer as Assistant Medical Officer of Health, at the commencing salary of £500 a year, rising to £600.

As a further step towards utilising the peal of Belgian bells, which have already cost over £3,000, the town council of Aberdeen decided on Monday to purchase a carillon machine of Mr. Edward Mirhiels, of Malines, at a cost of £550.

The Blackpool Corporation decided on Friday to go again before the ratepayers with an amended Improvement Bill. The promenade widening clauses are to be dropped out, but the scheme for the restoration of the lower walk, at a cost of £50,000, will be included. An amendment that the Bill be entirely dropped until the next session of Parliament was defeated.

The town council of Tynemouth have entered into negotiations with the Duke of Northumberland to sell them a site of half an acre of land in Albion-street, a central position, on which to build new premises for the free library, now inadequately housed, together with a museum, art gallery, and lecture-hall. The Duke has agreed to sell, and preliminary plans have been prepared by Mr. J. F. Smillie, the borough surveyor, for the new buildings, which are estimated to cost from £12,000 to £15,000.

Mr. Alexander Melville, portrait-painter to the Queen, died at his residence, 6, Fitzroy-square, on the 26th ult.

The death is announced, at the age of 54 years, of Mr. Charles Norman, builder and contractor, of London-road, East Grinstead. He leaves a widow, three sons, and several daughters.

The Lady Chapel in St. Peter's Church, Dormer-place, Leamington, has lately been decorated with additional paintings, illustrative of the life of the Blessed Virgin. It has been done by Mr. Jos. Pippitt, of the firm of Hardman and Co.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

JAS. LOUGHLAN, Belfast. (We should think you would get the mouldings at W. H. Lascelles and Co., 121, Bunhill-row, E.C. Any good builders' ironmonger would get you the socket cast.)

THE ACTION OF HEAT FROM OPEN FIREGRATES, STOVES, AND HOT-WATER PIPES.

To the Editor of the BUILDING NEWS.

SIR,—Having read with much interest the articles on the above subject in your recent issues, I should like to suggest that, in addition to the projecting fireclay backing for grates, which, it is submitted, would throw all the heat rays in an outward direction, as shown in sketch 1, it certainly would be an additional advantage to prevent the loss of heat by "radiation" or "transmission" backwards through the party or outer wall, by placing a non-conducting incombustible material, such as silicate cotton, at the back of the fireclay slab. There is no doubt that a very large percentage of heat is naturally lost through absorption at the backs of fireplaces, and it stands to reason that if the heat which is thus lost could be made proper use of by being concentrated and radiated forward—particularly in a downward direction as suggested by Mr. Dye—not only might fuel be greatly economised, but comparatively *complete* *combustion* would be the result, and little or no smoke would pass up the chimney. Apart from economy in *heat-yielding*, the complete combustion of carbon (so far as an open fireplace permits) would go a large way towards diminishing our London fogs. Of course carbon can be totally consumed in a crucible, but in treating with an ordinary open fireplace, I simply wish to show that by concentrating the heat all round where the combustion of fuel is going on a great deal might be done towards a more complete consumption of the particles, which otherwise will be forced up the chimney by the ordinary induced draught.

Sketch 2 shows what would probably be the loss of heat through absorption and radiation in the wrong direction at the back of the fireclay slab, and sketch 3 shows how the heat with which the fireclay may be surcharged might be forced to radiate in an outward direction.

The ordinary fireplaces with which I have experimented in the manner indicated—viz., with a backing of silicate cotton or "slag wool"—have yielded, through radiation, a much larger percentage of heat than if backed with the ordinary "brick rubble and mortar," and I shall be happy to furnish details of the experiments, should they be of sufficient interest to your readers.—I am, &c.,

James Christie.

41, Priory Park-road, Kilburn, N.W., Jan. 26.

THE SOCIETY OF ARCHITECTS.

Sir,—Referring to "Goth's" paragraph in your issue of the 22nd ult., as to an expected change in the title of the Society of Architects, my attention having been called to the remark in question, I should like to say that I fear "Goth's" authority is defective. I do not know of any such change as he hints at,—I am, &c.,

W. H. Seth-Smith.

46, Lincoln's Inn-fields, Feb. 8.

* * *

CHIPS.

The third of the course of free lectures given daily this session at Carpenters' Hall, London-wall, E.C., was delivered on Wednesday evening by Professor Henry Robinson, M.Inst.C.E., who gave an address on "The Drainage of Buildings and Construction of Sewers," illustrated by diagrams.

The annual meeting of the Leaseholds Enfranchisement Association was held on Thursday evening last at the Memorial Hall, Farringdon-street, E.C., Mr. H. L. W. Lawson, M.P., the president, in the chair.

The decoration of the chancel of the parish church of St. Austell has just been completed. The panels were designed by Mr. Edward Fellowes Prynne.

Mr. Wm. Scorer, architect, Lincoln, has been appointed by the Department of Science and Art, South Kensington, the local inspector of drawing for the South Lincolnshire district.

Mayor-General H. D. Crozier, R.E., an inspector under the Local Government Board, held an inquiry at York yesterday week into the application of the corporation for power to obtain loans as follows:—£9,572 for the purchase of premises for street improvement; £550 for purchase of land for an extension of the depot on Foss Island; £400 for the purchase of land for a rubbish tip; £2,200 for the purchase of land for market extension; and £11,055 for the purchase of the York Institute, the Yorkshire Fine Art Institution, and the York School of Art, for purposes of a Technical School, a Free Library, an Art Gallery and Museum.

A new mill has been erected at Burnley, from the designs and under the supervision of Mr. Samuel Keighley, engineer, &c., of 27, Nicholas-street, Burnley.

A statuary marble tablet, designed by Mr. A. F. Smith, and executed by Mr. J. Roddis, of Birmingham, was unveiled at the Bloomsbury Institute on Monday last, its object being to perpetuate the memory of the late Mr. D. Smith, F.R.S.A., the founder of the institution.

The restoration of Peterborough Cathedral, which has been in progress for the past ten years, is now rapidly approaching completion. The first set of stalls on the south side of the choir are completed, and service will be resumed beneath the lantern in about a week's time. The new marble mosaic pavement in the choir is nearly finished.

The free public library at Longton, Staffs, was opened on Thursday week. It occupies the premises of the defunct Mechanics' Institute, which has been refitted from plans prepared by the borough surveyor, Mr. Wardle. Mr. Peter Bennion was the contractor.

Intercommunication.

QUESTIONS.

[10709.]—**Depth of Hip-Rafter.**—Practical men say that the hip-rafter should be the depth of the purlin plus half the depth and the depth of the spar added together, for a right-angled building, and the roof three-quarter pitch, with the hip-rafter *backed*. This would make all the timbers flush on top and bottom edges of the purlins and hip-rafter. Is this practically correct?—Tyro.

[10710.]—**Baker's Ovens.**—I have a pair of baker's ovens to construct abreast. I shall be glad of any experienced correspondent's advice as to foundations, dimensions of walls, ovens, positions of tie-rods, and provision to carry a 50ft. shaft. It is a wood oven.—A Twenty Years' Reader.

[10711.]—**Wooden Houses.**—I shall be glad to know where I can obtain information as to cost, &c., of wooden houses, with the names of American or other firms who make a speciality of this sort of work.—G.

[10712.]—**Swimming Baths.**—1. What material is considered most suitable for the bottom and sides of swimming-baths? 2. To obtain a transparent sea-green to the water, what colour should the bottom and sides be? 3. Can the desired colour be obtained by the use of tinted glass in the skylight over bath? 4. I presume the effect which might possibly be produced by the use of tinted glass, could not under any circumstances be obtained when the building is lighted with gas? 5. Where can I see any examples?—Architect's Pupil.

[10713.]—**Quantities.**—Can any of your readers inform me what are the items that usually come under thicknesses in the Joiner's bill, and in what order they are billed?—Student.

REPLIES.

[10703.]—**Concrete for Artisans' Dwellings.**—I am very much obliged by your insertion of my inquiry as to laying flooring on concrete, and to those who gave the valuable suggestions in reply. The great importance at the present time of the question of housing the labouring classes in cities will, I trust, be a sufficient excuse for troubling you with a question or two more, which may elicit from some of your readers their experiences for the benefit of those who, like the writer, are endeavouring to solve the question of economical and yet substantial labourers' tenements in their own localities. It is proposed to replace joists on upper stories by slabs of coke-breeze concrete, the walls being levelled off for each story at under-side of floor concrete, which would be then laid on the walls through their full thickness, and the walls of next story carried up from top surfaces of the slabs. On these slabs the flooring would be nailed. 1. Should the breeze be used just as it is got from the gasworks, or is it necessary to remove any of the very fine part of it, or to add any other material to it, and in what proportion should it be mixed with Portland cement for this particular purpose? 2. What is the largest size of floor that is shown by *practical* experience to be safe without any support except on the walls as above described, and using slabs of 5in. or 6in. thick? 3. If breeze is used for the walls, which would vary from 5in. to 9in. thick, would it be necessary to add any other material, and what proportion of cement should be used for wall work?—Surveyor.

* * *

At the Bankruptcy Court, on Friday, William Smith, builder and contractor, of Trowbridge, came up for his public examination. He admitted his liabilities were £3,148, and the deficiency amounted to £1,920. He was ordered to file an amended deficiency account.

A new water supply is about to be provided for Norton, near Malton, Yorks, under a scheme prepared by Messrs. Fairbank, civil engineers, of Westminster and Driffield. The spring is at the foot of Horne Hill, and at a depth of 60ft. yields nearly 200,000 gallons a day. The reservoir will be constructed on Horne Hill.

During the carrying out of the works of restoration of the Church of St. Swithin's, Baumber, Lincolnshire, several discoveries have been made. At the two doorways of the tower have been found Norman arches and other fragments of a church of some magnitude. Interesting work of the 13th century has also been found in the arcades of the north and south aisles, the columns and arches of which, though hidden beneath thick coatings of plaster, prove to be of good stonework. The restoration is being carried out by Messrs. Walter and Hemman, of Horncastle, from plans by and under the direction of Mr. William Scorer, of Lincoln.

Canon Hicks is giving two courses of lectures on classical archæology at Owens College, Manchester. The subject of the afternoon course, which began on Thursday in last week, is "Græco-Roman Crafts and Trades." In the opening lecture Canon Hicks gave an outline of the development of the potter's art in Greece, tracing the influence of Eastern styles, and explaining, by the aid of photographs and illustrations, the gradual growth of the methods which enabled the Greeks to produce their best work. The second lecture, delivered yesterday (Thursday), dealt with the practice of the potter's art in Rome, and subsequent lectures will be occupied with the crafts of spinning and weaving, embroidery and needlework, metal-work, glass, and mosaic. The Wednesday evening course is upon Græco-Roman Mythology.

Legal.

THE BASIS OF COMPENSATION.

UNDER the various statutes passed for the purpose, numerous buildings are nowadays being demolished as unfit for human habitation. But then there arises the question, What compensation shall be paid to the owners of such property? It is generally difficult for local authorities and landlords to agree upon the value, and so these claims frequently go to arbitration. Their architects, surveyors, and house agents all have to give evidence on behalf of the parties, and the arbitrator has to decide on all the facts and figures brought before him by some rule or other; or, in other words, to assess the compensation payable according to a clearly defined principle. In the recent case of some house property in Liverpool, reported in our issue of last week, and more at length in the *Times*, January 23, a very important point affecting cases of this kind was decided. The dispute as to the sum to be paid to the owner had been sent to the arbitration of a Queen's counsel, who, taking it as admitted that the premises were unfit for human habitation, declined to value them as houses at all, and assessed the sum due to the owner for compensation as being only the value of the ground as a site, and of the premises themselves as merely building materials, thus arriving at a total of £300. From this view the claimant appealed to the Divisional Court, where it was held that the proper principle in such cases was to estimate the market value of the property as producing rent, and that upon this basis the assessment should be £667.

It was then the turn of the corporation to appeal, which they did, with the result that the Court of Appeal upheld the decision of the Divisional Court as to the point of principle, but said that this Court had no right to settle the figures, and so the case went back once more to the arbitrator. This time he heard further evidence, and it appears that he took the market value of the premises as houses that were producing rentals at the sum of £667, as to which both sides were practically agreed; and then deducting 30 per cent., because of the insanitary state of the neighbourhood, brought out the amount payable at £468, though he gave no reasons for this result. Once more the case was taken back to a Divisional Court; but this time the arbitrator's award was confirmed. It was laid down that as he had based his assessment of compensation upon the right principle, the amount should now be left to his discretion. The rule was, as already stated in the Court of Appeal, that the price for which such property would sell should first be ascertained; then, having got that sum fixed, the arbitrator could deduct what he thought proper, having regard to the condition of the premises, including their insanitary state. The Court now considered 30 per cent. a fair amount to take off for that reason, and so they practically agreed to the award for £468, refusing to send it back again. The use of this basis of principle may save much litigation in future cases of similar claims for compensation.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning, to insure answer same week.

M.S.A.—Penalty.—Charges.—If the contract is clear and stringent, the penalty is enforceable, and so it could be deducted or set off as a counterclaim. The assignee could not stand in a better position than the contractor. The architect's extra charges should, I think, be paid out of the penalty received by the owner.

A. D.—Land.—Drains.—If B. bought the land and cottages subject to this easement of drainage, he cannot cut off the sewer or compel adjoining owners to pay him rent. The matter should be arranged.

M.—Right of Light.—If the opening-out of the windows in no way interferes with any one, I do not see how it is to be prevented.

M. C.—House.—Drains.—If the landlord is bound under a lease or agreement to do repairs, notice should be given him of what is needed, and if he will not do them then the tenant can, and charge him with the cost. But under an ordinary yearly tenancy, as this seems to be, the landlord is not legally bound to do anything. You can employ any sanitary inspector you like, or an architect, at your own expense. There are only the local sanitary inspectors to be called in.

LEGAL INTELLIGENCE.

The Battersea Fire.—Mr. Braxton Hicks resumed yesterday (Thursday), at the Vestry Hall, Battersea, the inquest on the two draper's assistants who lost their lives in the fire, Dec. 19th, at Minnis's premises, 307 and 309, Lavender-hill. As on previous occasions, the coroner was assisted by Mr. F. J. Chambers, F.R.I.B.A., as assessor. Conflicting evidence was given as to the water-supply and pressure. Engineer Glover, of the Fire Brigade Station at Battersea, emphatically asserted that there was a good supply of water. The roof and party-walls of the premises fell without warning twenty minutes after the outbreak, and the front walls followed. Joseph Wrestler, chief engineer to the Southwark and Vauxhall Water Co., gave evidence as to the water supply and pressure at the time of the fire. His directors regarded the fire plugs as antiquated, and as recently as November 27 they wrote to the London County Council pointing out that in their opinion the plugs were inadequate. This had been only formally acknowledged. Mr. John T. Pilditch, surveyor to the Battersea vestry, deposed that the water supply was neither regular nor sufficient, but that it was improving. As to the shop burnt, the vestry never sanctioned the line of frontage adopted, but the then Metropolitan Board of Works declined to interfere, although correspondence passed on the subject, and as the vestry did not take action within six months, the matter dropped. Mr. Byworth, the vestry clerk, was called, and laid the blame on the late Board of Works; but the coroner suggested that the initiative lay with the vestry. Professor T. Roger Smith, F.R.I.B.A., district surveyor for West Wandsworth since 1874, said he had examined the remains of the buildings destroyed, and found that the upper part of the party-wall between the houses would have been of the right thickness if there had been no rooms in the roof. The Building Act was very vague on this point, and, indeed, no matter was more in dispute. Witness held that the full thickness of wall should be continued to the apex of the ceiling, but other district surveyors considered that the wall need only be of full thickness up to the tie-beam. He believed the late Mr. Edward I'Anson, the district surveyor when these shops were constructed, took the latter view, which was upheld in the case of "Hodgson v. Ford," heard in 1890. As a matter of fact, he considered the wall too weak. The reasons for the rapid spread of fire were the use of matchboarding in the shops, with a hollow space behind, acting as a flue; the use of stud partitions on the first floor, and the fact that these were carried on a naked iron girder simply toed into the party-walls. The risk of life was gravely increased by the removal of the second staircase, and by the encasing of the remaining one in stud-work. In reply to the Coroner, the witness said that under the present Acts the district surveyor had no control over the matchboarding of shops, the throwing of the two buildings into one, and the removal of a second staircase. When the two premises were thrown into one, the central wall ceased to be a party-wall, and openings could be made in it. The Coroner: Legally, it ceased to be a party-wall; but, as a matter of common sense its character had not been altered. Witness, in reply to questions, said the London police magistrates refused to recognise "danger" in case of fire, or other risks other than structural matters, and shops in which fewer than forty persons were employed did not come within the range of the Factories Act. Under subsection 15 of sect. 20 of the Building Act of 1855, no chimney-breast could be cut away without a certificate from the district surveyor; but, of course, the central wall had ceased to be a "party" wall. The chimney-breast in No. 39 had been cut away, but that wall had stood. To Mr. Barnard, representing Mr. Hardcastle: The only offence against the Building Act he could find was that there were no piers or posts under the bressummers. The examination of the witness was not concluded when the Court rose, the Coroner intimating that the inquest would be completed at the ensuing sitting on Thursday next.

Is Duroline a "Combustible Material"?—Payne v. Wright.—(Before the Master of the Rolls and Lord Justice Fry. Court of Appeal, Feb. 1.) This was an appeal from the Queen's Bench Division (Mr. Justice Mathew and Mr. Justice A. L. Smith) upon a special case stated by a metropolitan police magistrate. The defendant, the managing director of the New Wire Wove Roofing Company, was summoned under the Metropolitan Building Act, 1885, by Mr. Alexander Payne, district surveyor, for having covered a roof of a building in Victoria Park-road, Hackney, within the Metropolitan district externally, with a combustible material, contrary to the provisions of section 19, subsection 1, of the Act. A notice had been duly given by the district surveyor to the defendant to obey the requirements of the section, and the defendant, having made default, was summoned before the magistrate under section 46 of the Building Act, 1885, to show cause why an order should not be made directing him to comply with the requisition contained in the notice. By section 47 the defendant would become liable to a penalty not exceeding £20 a day if he made default in obeying the order of the magistrate. The question before the magistrate was whether "Duroline" was an incombustible material within the meaning of section 19. The magistrate held that the material as a whole was incombustible within the meaning of the section, but stated a case. The Divisional Court held that the magistrate was wrong, and remitted the case to the magistrate to make an order under the section. The defendant appealed. The preliminary point was taken that this was a "criminal cause or matter" within the meaning of section 47 of the Judicature Act, 1873, and that no appeal lay. The Court dismissed the appeal; both the Master of the Rolls and Lord Justice Fry held that the decision in "*Ex parte* Schofield" was conclusive of this case.

Relative Liability of the Employer and the Sub-Contractor.—Hunt v. Mowlem and Co.—In the Queen's Bench Division, on Feb. 1, before Justices Hawkins and Wills, the plaintiff, a bricklayer, claimed to recover from Messrs. Mowlem and Co., contractors, damages for personal injuries, both under the Common Law and the Employers' Liability Act. The defence was that the plaintiff was not in the employ of the defendants, but in the employ of a sub-contractor for labour for brickwork, named Bells. Further, there was no evidence of negligence on the part of the defendants or Bell's servants. On the other hand, it was said, on behalf of the plaintiff, that the only name painted up as that of the firm performing the work was that of Messrs. Mowlem, and plaintiff thought he was in their service, and did not know anything to the contrary until after the accident. The jury, at the trial before Mr. Commissioner Kerr, awarded the plaintiff £175 under the Employers' Liability Act, and gave an alternative verdict for £50 in regard to the common-law claim, and the defendants now moved that judgment should be entered for them or for a new trial. The Court refused to enter judgment for the defendants, but granted a new trial, the case to be heard in the Bloomsbury County Court.

Sky-Signs Doomed.—John Jenkins, 34, Camberwell-road, was summoned at the Lambeth Police Court on Monday by the London County Council for having retained a sky-sign without a license. Mr. Thomas Chilvers, on behalf of the Council, observed that, under the 5th section of the London Sky-Signs Act, it was provided that every person, within three months, should, if desiring to retain sky-signs, be bound to give notice to the district surveyor, and, within fourteen days afterwards, to apply for a license. The defendant had never complied with the Act, or taken notice of any orders given to remove the sign. Mr. Mullins, assistant to Mr. Banister Fletcher, district surveyor, proved that the defendant did not apply for a license to retain the sign. The defendant consented to remove the sign, and upon that Mr. Hopkins imposed a fine of 1s. and 23s. costs.——Messrs. Skinner and Co., bottle dealers, of 206, Kennington Park-road, were summoned by the County Council for retaining a sky-sign without having obtained a license. Mr. Chilvers informed His Worship the sign had been removed, and asked that a nominal penalty only should be imposed. Mr. Hopkins imposed a penalty of 1s. and 23s. costs.

Re George Luff.—A sitting was held on the 22nd ult. for public examination. The bankrupt was a builder, carrying on business at 13, Lime-street, and Bromley. His accounts showed total liabilities £2,927 16s. 8d., of which £621 4s. 4d. are unsecured, and assets £357 7s. 8d. A trustee of the estate, together with a committee of inspection, having been appointed upon the application of the official receiver, the examination was adjourned to Feb. 19th, the bankrupt to file a cash account.

◆

The new cathedral at Marseilles, which has been in progress for the past thirty years, will be opened this spring. It occupies the summit of a hill overlooking the docks, and is Byzantine in style, with domical roofs to the principal features, and has cost over £550,000. Great use has been made in construction both externally and internally by variously coloured stones and marbles. The extreme dimensions are 475ft. in length by 175ft. across transepts. The central dome is 242ft. high, and the twin western towers are each 178ft. in height. The architect for the completion is M. Revoil, of Nîmes, represented on the works by M. Errard, the resident architect.

It is stated that at the election of Associate Academicians last week, only two architects, Mr. T. Graham Jackson and Mr. Aston Webb, obtained votes. The joint-architect of the Birmingham Assize Courts and the restorer of St. Bartholomew's, West Smithfield, can afford to wait.

Our Office Table.

◆

The thirty-first exhibition of the Glasgow Fine Arts Institute, held on Monday, is one of the strongest held by that body in recent years. The council have reduced the number of works shown by each artist to two, and thus secured great variety in the exhibits. The leading place is given to Sir F. Leighton's "Bath of Psyche," bought by the Chantrey Trustees after the Academy Exhibition of 1890, and Orchardson, Burne Jones, and Colin Hunter are also represented. Mr. Walton, of Glasgow, sends a presentation portrait of Sir James King, ex-Lord Provost, intended for the Corporation Art Gallery, and good portraits are also shown by Herkomer, Ouless, James Guthrie, Laverie, J. J. Shannon, and Walter Sickert,—the last, of course, being Impressionist treatments. Denovan Adams's Highland cattle are well posed with reference to the landscape background. J. M'Tagart, A. Frew, and Wilson Steer contribute seascapes, and among the landscapes worthy attention are those by John Smart, A. K. Brown, Wingate, and J. M. Henderson.

We regret to announce the death, in his 72nd year, of Dr. G. G. Zerffi, one of our oldest contributors, which occurred from pneumonia, following on influenza, on the 28th ult. at Chiswick. Dr. Zerffi was for upwards of twenty-four years lecturer on the historical development of ornamental art at the Science and Art Department, South Kensington, and was expected to have resumed his lectures from week to week since his illness. "A Manual of the Historical Development of Art," which, with outline illustrations, appeared first in the Building News, and "Studies in the Science of General History," were among his most widely known books. He was a popular lecturer on historical subjects, and a member of the councils of the Royal Society of Literature and the Royal Historical Society. Dr. Zerffi was a Hungarian by birth, and took part in the Hungarian Revolution of 1848, serving as captain in the Second Corps of the Revolutionary army. He also edited the *Ongar* in Pesth. He became naturalised soon after taking up his residence in this country, some 40 years ago.

Mr. Philip Charles Hardwick, F.S.A., who died after a long illness on Wednesday week in his seventieth year, was one of the pupils of Edward Blore, but his own leanings were towards Classic architecture. At the age of twenty he assisted in the practice of his father, the late Philip Hardwick, R.A., F.R.S. Mr. P. C. Hardwick held many public appointments, including those of architect to the Bank of England, to St. Bartholomew's Hospital, to the Goldsmiths' Company, to the Merchant Taylors' Company, to Greenwich Hospital, and to the Charterhouse, and was surveyor to the Portman Estate. For many years he had rendered good service to the Artists' Benevolent Institution, of which he was hon. treasurer. Among his principal works are the central hall of Euston Station, added to his father's building; the Great Western Hotel at Paddington Station; the Ship Hotel, Greenwich; Adare House; Madresfield-court, Earl Coventry's seat; Addington Manor; the New Charterhouse School buildings at Godalming; Drummond's Bank, Charing Cross, and many other banks and blocks of City offices. He was one of the competitors selected to send in designs for the Albert Memorial, and he was also invited to compete for the Law Courts, but declined. In 1884, when the designs for the rebuilding of the War Office were under consideration, he, together with Mr. Ewan Christian, was appointed to the committee of selection as a professional adviser. Mr. Hardwick was one of the senior members of the R.I.B.A., having joined as a Fellow and life member in 1850. He married in 1872 Helen, eldest daughter of Mr. Robert Eaton, of Bryn-y-Mor, Swansea, and Claverton Manor, Bath.

The death is announced from Dorlin, Corstorphine, of Mr. John Chesser, architect, late superintendent of works to George Heriot's Trust, at Edinburgh. Born at Dalmeny, the deceased, on acquiring a knowledge of the joiner trade, crossed the Border, and while yet a young man held the post of master of works during the erection of some public buildings in Lincolnshire. On the death of his father he returned to Dalmeny, and succeeded him as superintendent of works on the estate of the late Earl of Rosbery. In 1858 Mr. Chesser was appointed superintendent of works to the Governors of Heriot's Hospital, in room of the late Mr. Alexander Black, and he acted in that capacity until about three years ago, when, on account of failing health, he resigned, and was granted a retiring allowance. During Mr. Chesser's term of office a large amount of Heriot Hospital ground had been feued, under the direction of Mr. Chesser, the late superintendent of works, who also prepared the ground and elevation plans. He also drew the plans for a number of the more recent Heriot Schools, the reorganisation of the Hospital School, and the reconstruction and extension of the Heriot-Watt College. The deceased, who is survived by a widow and grown-up family, was in his 73rd year.

THE contracts which were entered into with various firms by the last London School Board for carrying out repairs to the schools of the board, as arranged in thirteen groups, and which, it will be remembered, gave rise at the time to much comment and discussion among the London builders, were terminable at Christmas, 1891. Notices were given by all the thirteen firms that they were unwilling to continue their contracts beyond that period on the terms then in force, thus apparently justifying the contention made by outside builders that the accepted tenders were taken at almost unremunerative rates. The measuring surveyor to the School Board, in a report to that body, suggested various alterations in the printed schedule to a view of reducing the inequalities in the prices, and the whole of the firms who had tendered, with one exception, were asked upon what terms they were likely to withdraw the notice to terminate the contract and to continue the work subject to a month's notice on either side. All the firms asked for an increase—one at the rate of 2½ per cent., another at 5, two at 10, two at 12½, four at 15, and two at 17½, and it is significant that the present board have, without inviting fresh tenders, accepted each amended offer. As to the group of schools hitherto in charge of the thirteenth firm, the contract has been relet after competition.

THE award in an arbitration case of considerable importance to local authorities throughout the country, was announced at a meeting of the Levenshulme Local Board on Monday night. The board, having decided to retain the control of their main roads, sent in a claim to the Lancashire County Council. The matter turned on the construction of a clause in the County Councils Act, which provides, in cases where the local authority retains the control of main roads, that the County Council shall contribute "towards" the cost of the maintenance of the same. By their award the Local Government Board have decided that, practically, the whole cost of the road maintenance in this case is to be paid by the County Council.

A MEETING of the South Hants and Isle of Wight District Council of the organisation for the National Registration of Plumbers, was held at the Municipal Offices, Southampton, on Thursday evening, the 28th ult., when the chair was taken by Mr. A. Doggrell. Mr. W. R. E. Coles, clerk to the Plumbers' Company, wrote forwarding a map of England, showing the districts of the registration movement. To fill two vacancies on the Council, Mr. W. E. Mitchell, architect, Southampton, and Mr. W. H. Williams, clerk of works at Southampton Docks, were elected. The hon. sec. stated that they had registered eighteen candidates during the eleven months the Council had been in existence. It was resolved to invite Dr. Harris (medical officer of health for Southampton), to give a lecture in the Hartley Hall, on "Sanitation."

◆

The local board of Gainsborough recently declined to purchase the market-place on the terms at which it is offered by Sir Hickman Bacon, the premier baronet. On Monday the board received counsel's opinion as to their rights in the mart-yard, as well as those of the public, and refused to sanction Sir H. Bacon's plans for new streets, &c., across this open space.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "London Building Legislation," by E. T. Hall. 8 p.m.
Liverpool Architectural Society. "Babylonia and Assyria as a Home of Early Literature and Science," by the Rev. F. F. Grensted. 6.30 p.m.

TUESDAY.—Society of Architects. "Lightning, and Protection from its Damaging Effects," by Alfred Hands, F.R.Met.S. St. James's Hall, Piccadilly. 8 p.m.
Institution of Civil Engineers. 8 p.m.
Leeds and Yorkshire Architectural Society. Exhibition of Sketches. 8 p.m.
Glasgow Architectural Association. Annual Supper.

WEDNESDAY.—Society of Arts. "Burning Oils for Lighthouses and Lightships," by E. Price Edwards. 8 p.m.
Carpenters' Hall Free Lectures. "Water Supply, Drinking Water, and Pollution of Water," by Dr. W. H. Corfield. 8 p.m.

THURSDAY.—Society of Arts. "Recent Travels in Indo-China," by Lord Lamington. 4.30 p.m.
Edinburgh Architectural Association. "Architecture of Scottish Towns," by Æneas J. G. Mackay. 8 p.m.
Dundee Institute of Architecture. "Glasgow Cathedral," by John Honeyman, F.R.I.B.A. 8 p.m.

FRIDAY.—Royal Institution. "Rain, Snow, and Hail," by G. J. Symons. 9 p.m.

◆

THE EXAMINATIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.—NOTICE IS HEREBY GIVEN that, after the close of the year 1893, all gentlemen who desire to qualify for Candidature as ASSOCIATE of the Royal Institute of British Architects (except in special cases submitted to and approved by the Council) will be required to enter for the PRELIMINARY Examination, and having passed it, work up through the INTERMEDIATE to the FINAL Examination, which in 1894 will take the place of the present "Examination in Architecture." The only examinations to which young Architects who are in practice, and who desire to become Associates without passing the Progressive Examinations, can enter, take place twice in the year 1892 and twice in the year 1893. Those, therefore, who may not be prepared to enter for the "EXAMINATION IN ARCHITECTURE," before the close of 1893, should take immediate steps to secure registration as Probationers, which they can do by passing the Preliminary Examination or obtaining the grant of exemption therefrom.

ASTON WEBB, Hon. Secretary.
WILLIAM H. WHITE, Secretary.

The Royal Institute of British Architects, 9, Conduit-street, Hanover-square, London, W., 25th January, 1892.

◆

CHIPS.

The citizens of Lincoln have decided by a considerable majority to adopt the provisions of the Free Libraries Acts.

The Emperor of Austria has conferred upon Herr Carl König, Professor of Architecture, and architect, in Vienna, the Order of the Iron Crown of the Third Class, in recognition of the services rendered by him in the erection of the Viennese Fruit and Flour Exchange.

The new Congregational church and schools erected at Blackbrook, St. Helen's, by Miss Ruth Evans, of Rainhill, in memory of her brother, the late Mr. Joseph Evans, of Haydock, are to be formally opened on Thursday in next week, the 11th inst. The estimated cost of the premises, which are Late Gothic in character, is between £25,000 and £30,000. Mr. T. W. Cubbon, of Birkenhead, is the architect.

The town council of Newport, Mon., have recieved sixty-six applications for the post of assistant building inspector, which is only worth 36s. per week. The candidates will be sifted by a sub-committee.

The Southampton school board proceeded at their last meeting to elect an architect in the stead of Mr. Howell, deceased. The terms offered were a fee of £52 a year, and 5 per cent. on all work carried out. Six candidates presented themselves, and Mr. J. H. Blizard was elected.

The workmen engaged on the alterations carried out at the Selby Union Workhouse at a cost of about £8,000, were on Saturday entertained to dinner in one of the new rooms of the workhouse, by the chairman and members of the board, to commemorate the completion of the principal part of the work. Among those present were Mr. L. H. Tacon, Rotherham, the architect, and Mr. Bradford, of the firm of Messrs. Chadwick and Sons, Mexborough, the contractors.

The Islington Vestry have directed the attention of the London County Council to the desirability of continuing the new road known as Rosebery-avenue (extending from Holborn Town Hall to St. John-street-road, Clerkenwell, and now nearly completed) along Owen's-row and Colebrook-row into Essex-road. This they recommend should be undertaken as a metropolitan improvement, which would serve greatly to relieve the congestion of vehicular traffic at the Angel. The continuation would follow the line of the New River, and little demolition of property would be required.

The Oxford City Council has declined to grant the open space in Broad-street opposite Trinity College (the finest position in the city), as a site for Cardinal Newman's statue, but has appointed a committee to confer with the donors as to a suitable site, and report back.

Trade News.

WAGES MOVEMENTS.

GREENOCK.—The operative painters of this town have received an advance from 7½d. to 8d. per hour on their wages. The masters have also conceded the ten-hours day which the men requested.

◆

At Taunton, on Friday, Huish Endowed School for boys was reopened. The Huish school was endowed in 1874 out of the surplus funds of a charitable bequest left by Richard Huish in 1615, so new and commodious premises have been erected at the rear of the old school in East-street at a cost of £5,000. The architect was Mr. J. H. Spencer, of Taunton; the builder, Mr. Derham, of Trull; and the clerk of the works, Mr. James, of Exeter.

The Wesleyan Day Schools, Beckwith-street, Birkenhead, which were injured by the excavations for the Mersey Tunnel, are to be thoroughly repaired, and to be enlarged and altered. The cost of alterations, which include the purchase of three cottages and the throwing of the site now occupied by them into the playground, is £1,500. Mr. Curwell, of Birkenhead, is the contractor.

◆

Holloway's Pills never cause pain or irritate the most sensitive nerves or most tender bowels. Holloway's Pills are the best known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

CHANGES OF ARCHITECTURAL FASHION.

WHEN "the 17th-century revolt against beauty" began to die out, when art in common things was once more held permissible and even desirable amongst us, it is curious to remember the directions in which it was looked for, and the rules by which it was to be attained. "Think only of utility," said one teacher, "and beauty will come of itself." "Build on Christian and not on Pagan lines," said others, "and you cannot fail." "Only keep your eye ever fixed on the eternal laws of morality," said a third guide, the most eloquent and popular of all. The docile architect of forty years ago heard the voices, and thought them good. His work became a solemn thing. Utility, morality, and theology all seemed to watch for his halting. "Am I living up to my principles?" was his ceaseless question. He could hardly design a string-course without a season of self-examination, or sketch out a tracery window without an inquiry into the purity of his motives. If Englishmen take their amusements sadly, they then took their art still more sadly. The perpetual strain on its producers would have been too much for human nature, had it not been for one happy circumstance. There was plenty of good art remaining from Mediæval times; the modern architect could copy it, and so escape his responsibilities.

This answered fairly well where churches were in question. An abundance of models remained, dating from the 13th and the early part of the 14th century, and their details were imitated everywhere. Works of a later date were generally avoided. Anything built after A.D. 1350 was looked upon with grave suspicion. It belonged, as the popular teachers insisted, to a period of decline, and was nearly sure to be tainted with moral baseness. Unfortunately, almost all the oldest domestic buildings in the kingdom are of the so-called period of decline. The earlier structures, which alone it was held lawful to copy, were, broadly speaking, only churches and castles. Of these, the churches were considered the purer in style, and the aim of the Gothic revivalist was consequently to repeat their features in season and out of season.

It was held in Shakespeare's time that the words of the hundredth psalm and the tune of "Green Sleeves" did not well accord and go together. Revivalists and Salvationists in our day judge differently, and are not slow to act on their judgment. But though they have familiarised us with the sound of psalms sung to song-tunes, neither they nor anybody else seem to have reversed the process. No one, so far, appears to have set music-hall ditties to airs from the "Messiah," and sacred music is still kept free from secular uses. Good taste might have counselled an analogous reserve in regard to religious architecture. But during the period now in question no such reserve was exercised. On the contrary, it was loudly proclaimed that churches and street buildings should be alike in style and uniform in character. We were to have Pointed arches everywhere—in cathedrals and in cottages, in shops and warehouses, in taverns and theatres. And this almost bore the aspect of a distinct moral duty, when we were reminded that the Pointed arch resembled the profile of a leaf, and so took us back to nature; whereas the rectangular opening was like nothing known to us in heaven or in earth.

The reign of the *doctrinaires*, however, was coming to its close, as far as the art of building was concerned. They had sustained the blow which is fatal to their class—their doctrines, namely, had been put in practice. However plausible they had sounded, they were ludicrous when followed to their results in brick and stone. It became clear, even to the meekest disciple, that features which are admirable in a church may be execrable in an office or a bank. Architects began to remember that, even in the Middle Ages, domestic architecture as soon as it came to exist in any quantity developed a marked type of its own, very different from, though perfectly harmonising with, that of the contemporary churches. They remembered that the square-headed windows, which they had been taught to look upon as all but sinful, were amongst the most charming features in the old manor houses and farmsteads which make the country beautiful. If such things were not copied from nature, yet "Nature gladly gave them place," and they now seem almost a part of herself. It was so with other details, and the result is that the secular architecture of former times has, in the last ten years, been studied as it never was before. Pointed arches have greatly gone out of fashion, and those to whom Gothic begins and ends with Pointed arches may suppose that the influence of Gothic is over. This, however, is far from being true. The forms are less copied, but the free, inventive spirit of the post-Classic world is more at work than it has been for centuries. Yet in one thing there has been a great change. Artists no longer hope to produce art by simply following utility, or theology, or morality. All these things are excellent in their place. As Sancho Panza says, "St. Peter is very well at Rome." But they will not, by themselves, blossom into architecture, any more than a cauliflower will blossom into roses, or a cedar-tree into lilies. In the long run, people get the sort of things they seek for; and to get art, we must seek for art.

This is the lesson, or at least one great lesson, which it has taken nearly half a century to learn. There have been repeated changes of fashion, no doubt, but the changes have not been altogether without a motive. In a recent lecture at the Architectural Association it was asked why, when we had such an elegant and suitable style as that of Adams, we wanted to give it up for another, and then change that for a third, and so on without end. Human aspirations, however, are infinite, and the soul has an ideal which even Adelphi-terrace can scarcely satisfy. And if for the moment some architects have taken up again a style which is not very far removed from that of Adams, it is only fair to remember how much of their own they have added to it. Architecture has pursued a long and devious course since George the Third was King; but its followers have picked up a good many flowers on the way.

It would be a fine theory, perhaps, to get rid of fashions in art;—but is it possible? They mean a waste of life and thought and energy. A man, in these times, has no sooner learnt his style, and trained himself to use it with something like expertness, than the style goes out of fashion, and he has to begin again and learn another. This is not exactly how styles changed in the ages of art. Fashions altered, it is true, but they altered by degrees. The Romanesque builder began to put a pointed arch here and there in his work, as strength required it. This slowly led to other changes—so that some of those who produced Norman work in their youth may have come very near to Early Gothic in their old age. But in this subsequent transition, the progress was gradual and natural. To take a classic example, it was like the progress in Sir John Cutler's stockings, which were originally of worsted, but which were darned so long with silk that they became a pair of silk stockings. Now the modern style-changes show little of the progressive alteration, they are "too unadvised, too sudden," and as new styles come lightly, so they go lightly. None of them lasts long, and yet, under all the style-changes of recent times, there is a certain continuity of spirit which should save us from thinking style a deeper thing than it is.

◆

PRACTICAL DIFFICULTIES IN ARCHITECTURE.

WHEN new problems are being daily presented to the consideration of the profession, and when statutory enactments are growing more numerous and precise, we cannot be surprised if the artistic architect views with repugnance those seemingly intractable and unsympathetic requirements which press upon him. He cannot submit to them without revolt; he rebels against innovations of the engineer, warming, ventilating, and electrical applications. His first impulse is to hide and conceal what is so repugnant to his sense of art; his next to acknowledge them openly; his last to treat them artistically as necessary evils. It is curious, but we have each of these aspects to record in the case, at least, of iron, which has at last to be recognised, and treated with consideration. Iron roofs were at first hidden, next accepted with ill grace, and lastly made ornamental. So it was with timber roofs, with brickwork both external and internal, with plaster, paints, and other decorative materials. For some time the idea of showing a roof was scouted as a monstrosity, an interior lined with brick was a vulgarity not to be thought of, and anything in the shape of a ventilator on a roof was intolerable; but we have "lived down" all those prejudices, which were mostly insular, as we are now ashamed of having so long robbed our churches and our houses of all their symbolical and appropriate features and furniture. After being abborred, they have come to be tolerated, and then admired. Many of the "fads" which now exercise so overwhelming an influence over ladies and upholsterers in domestic decoration were not long ago pronounced intolerably vulgar.

We here draw our readers' attention to a few of the many problems with which the architect has been trying to grapple, though scarcely with success. Many of these are requirements of a structural kind, imposed by clients or by statutory provisions which are of recent introduction. The large open floor is one of the necessities of business premises. A reference to those of recent construction shows how seldom anything is attained architecturally, especially when irregularities of shape occur, and walls of an upper story have to be provided for by a system of girders and columns. It is a crux for the art architect. Take, for example, a large bank or show-room, where light has to be studied. Architectural treatment is out of the question, and the only thing that can be done is to subdivide the space by columns and ceiling-beams and make a feature of the walls and ceilings by appropriate decoration. The average builder leaves the problem in the hands of the decorator. The real architect divides his space, and tries to make features out of the necessities, such as a staircase or lift. The former leaves the position of his iron columns to the engineer, and puts a large sprawling capital just beneath the plain surface of ceiling, the effect of which is ridiculous; but the thoughtful designer arranges his supports beneath the girders, and properly places above them an entablature, which in its turn rests upon the capitals.

Irregularity of shape is a harder nut for the architect to crack. Take a large room with the walls running at different angles—a crooked or trapezoid-shaped room. What can be done to make it architectural? Expedients to disguise its crookedness may sometimes be used, but these are not always practicable in business premises. Of course, the arrangement and treatment of the ceiling where the irregular angles are most discerned demand much skill on the architect's part. Acute and obtuse angles are the least amenable to artistic expedients. A building with an acute angle externally offers equal difficulties, and few architects have overcome it better than Mr. Waterhouse has done at the Manchester Town Hall and the National Liberal Club.

The plate-glass craze has always been a bugbear to the architectural mind. Happily, the problem was shelved when the Modern Renaissance strove to introduce the mullioned and the small-paned window. The negative effect of plate glass, like space, is scarcely one of the elements that can be utilised for architectural effect. One other feature requiring considerable study is the circular corner, and the only satisfactory solution is that adopted by Soane at the Bank of England at one acute angle, where he has adopted a circular colonnade and recess—the only reasonable way of getting over the window difficulty.

A new set of problems has been introduced by recent proposals of the London County Council, as in those regulations against fire which have been drafted in respect of theatres, houses, and rooms of public resort, and which were formally adopted by that body on Tuesday. One of the most important requirements is that *one-half* at least of the total length of the boundaries of the site of any such premises, or, in case of a room, one-half at least of the total length of the boundaries of the site of the building, shall abut upon public thoroughfares, of which one at least shall be not less than 40ft. wide, and of the remainder none shall be less than 30ft. wide if a carriageway, or 20ft. wide if a footway. No such premises are to be erected upon a site within 20ft. of any windows or other openings. This regulation, if carried, will very largely restrict the number of buildings available for places of public resort. One-half of the total length of the boundaries of a building or room means that at least one side and one end of the site or building must abut on a thoroughfare. It must, in fact, be a corner site facing a thoroughfare, with a side street or way of at least 20ft. wide. Architecturally, the rule is an advantage, as it will insure that two sides of the building at least will be seen, but the restriction will handicap many promoters who desire to convert buildings into public assembly rooms. No doubt promoters or owners of buildings suitable for public resort will take the hint and obtain early permission. Then there is the rule that all such premises shall be provided with a sufficient number of dressing-rooms in a separate block, or divided by party-walls from the place of public resort; that these rooms are to have an independent exit into a thoroughfare; that they are to have only one story below the street level; that no theatre is to be constructed underneath or on the top of any part of any other building, nor to have more than three tiers or horizontal divisions, including the gallery, above the level of the pit. This condition will require some thought on the part of architects dealing with old premises. Every tier or floor is to have two separate exits not leading into the same thoroughfare; and if divided into two parts, each part is to have two such exits, affording ready egress from both sides of each tier. Not more than three tiers or floors are to communicate with one vestibule, and the width of the latter is to be one-third greater at least the united width of all the doorways and passages leading thereto. From these requirements it will be seen that the planning and construction of premises will call for more than ordinary skill. Among other details is the design of doorways, which are not to be less than 4ft. 6in. wide in the clear, with folding-doors made to open outwards. Each of the two folds will have to be hung on the outer part of the jamb, and some mechanical ingenuity will be required to design doors with jamb linings to admit of their being opened both inwardly and outwardly without impeding the traffic in both directions. Professor Herkomer the other day made some suggestions for improving the shape of the auditorium and the lighting of the stage of a theatre which deserve attention. The profession will certainly do well to take stock of all these suggested improvements to buildings and their fittings, and set themselves the task of finding out how they may be utilised without destroying the character of the buildings. By so doing they will be helping onwards the claims of their art, which, if it is to be real and living, must take cognisance of new materials and methods instead of leaving them to the cold and unsympathetic hands of the mechanical worker.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fortnightly meeting of the Institute was held on Monday evening, the President, Mr. J. MacVicar Anderson, in the chair. The President referred to the death of Mr. Philip Hardwick, remarking that he was an able architect and an honourable man, whose works were both important and numerous.

THE ROYAL GOLD MEDALLIST.

The President announced that the Council proposed to submit the name of M. Cesar Daly, of Paris, an honorary and corresponding member, to Her Majesty as the recipient of the Royal Gold Medal for 1892, for his works as a man of letters. He read a letter from M. Daly, in which, after expressing gratification at the honour proposed to be conferred upon him, he added: "You know already the strong ties which bind my youngest memories with England and Englishmen; but the favourable vote of your Council binds my old age by a new tie that no strain will ever weaken." The announcement and the acknowledgment by the suggested recipient were received with applause.

LONDON BUILDING LEGISLATION.

Mr. Edwin T. Hall read on this subject a paper which, in effect, was an exhaustive exposition of the views of the Practice Standing Committee of the Institute, who have considered the codification and amendment of the Metropolitan Building Acts during the past two years, and whose draft suggestions have been approved by the Council of the Institute. The committee had, Mr. Hall stated, endeavoured to insure safe and sanitary building with as few restrictions as possible on artistic design. Great attention had been given by the committee to definitions. Many subjects defined in their draft were not defined in the existing Acts, while new definitions had been given to many others; among the former were—"building," structure, wall-sign, warehouse, domestic building, living room, flat, business offices, story, topmost story, floor area, superficies, cubic contents, and fire resisting; and the latter included public building, site, base of the wall, foundation, builder, street (instead of roadway), and centre of street. Several of the existing exemptions to the Act were, he thought, manifestly opposed to the public interest, and therefore recommended to be removed or limited in scope, while new exemptions of very small buildings from the general rules of the Act were suggested. An important addition to the Act was the section dealing with the "alteration in purpose or character of a building," and a new section also provided for the restoration of buildings of architectural, archæological, or historical interest; while the section for "rebuilding old buildings" was varied. With reference to foundations and sites, several alterations were suggested. As to recesses and openings in external walls, it was proposed to modify the law by enacting that the recesses and openings in any story shall not exceed one-half of the superficies of the wall of such story in "which they are made;" this limit not to apply to that portion of an external wall between its base and 30ft. above the level of the public footway immediately in front of the centre of the façade, or where there is no such footway, then above the actual level of the ground before excavation. Turning to party-walls, a new principle had been adopted for fire prevention and stability. The theory of ownership in the existing Acts was not interfered with; but the new principle of construction was that there shall be in the centre of the new party-wall a continuous backbone of brickwork, the thickness of which neither owner shall diminish. On its own side only of this backbone could the flues of any building be placed. As to the formation and superficial limits of recesses in party-walls, the new section provided that the recesses should be arched or corbelled over in the height of the story in which they are made, and that their extent shall be measured by width, not area. As to the section governing united buildings, a direction to the County Council was suggested to consent to the uniting of buildings which were not wholly in the same occupation. In the case of floors of fire-resisting materials such uniting might, he thought, within limits be permitted with perfect propriety. Under the heading of Miscellaneous, an effort had been made to get rid of the public danger arising from advertisements on combustible hoardings "on the face or in front of the external wall of any finished building." The subjects of timber in external walls, bressummers, and the height of party-walls above roofs having been dealt with, the lecturer turned to the payment of the cost of party-walls and the question of stories in the roof. A new section for chimney shafts from furnaces incorporated the essentials of the existing rules which the County Council adopted in sanctioning such shafts, while in the rules as to other chimneys and flues many variations in detail had been made. Alterations had also been made as to the construction of habitable rooms, the minimum height, except in the roof, being increased from 7ft. to 8ft., and minimum areas of windows, dormers, lantern lights, &c., had been fixed. The Draft next embraced all the building regulations of the Public Health Act for underground rooms let as separate dwellings, and added regulations for other underground rooms not so let. Projections beyond the general line of building had also received careful attention. The sections had been drawn anew, so that cornices of shops might to a specified extent overhang the public way, but no other part of a shop-front might encroach on it. Permission for bay windows and similar projections over building owner's own land was given, thus legalising what was a pretty general practice; while adjoining owners were sought to be protected from overlooking and encroachment. The County Council had apparently considered overhanging constructions only in relation to the public way, for the limit for oriels and turrets not to be lower than a certain height above the level of the footway was unnecessary and undesirable where they were over the building owner's own land. Another sub-section was designed to insure the construction of party-walls in buildings subsequently converted into two or more buildings, and a further section to secure fire-resisting construction in a building erected or converted into two or more divisions, intended for or adapted to be used as flats, or as warehouses, or which is let or occupied in two such divisions. The new section assumed a building to be that which it was popularly understood to be—viz., a cube resting on the ground and covered by a roof. The suggested regulations for governing lift-shafts were next considered. Lifts, in the suggestions of the committee, were divided into three classes—(1) those which were inside a building with fire-resisting floors containing flats or business offices; (2) those outside the external wall; and (3) those inside warehouses which pass through fire-resisting floors, and where it is not the practice to inclose the lifts with walls. In all three classes it was proposed that all openings into shafts should have doors or covers of iron, or other fire-resisting material. As to the present maximum heights of buildings in the 1890 Act, that maximum was proposed to be reduced from 90ft. to 75ft., and the height of two stories in the roof (at present unrestricted) limited to 20ft. The provision for open spaces at the rear and sides of dwelling-houses was next dealt with, and Mr. Hall said the London County Council were now going to an extreme in proposing to require an open space at the rear, not only of domestic, but of all buildings, which space between the opposite backs of two buildings would be practically double the width required between the opposite fronts of buildings. He thought, upon further consideration, the County Council would agree that the necessities of the case were met by the suggestions in the Institute Draft. Mr. Hall, before closing, referred to a new section dealing with drains and sanitary apparatus, &c., which left all details to by-laws.

Mr. H. H. Collins, in moving a vote of thanks to Mr. Hall, urged that the present Act, which had been in operation for 36 years, deserved the credit it had gained. They did not want over-legislation, for neither architects, district surveyors, builders, nor clerks of works wished to go to school again. He hoped the committee would deal with the difficulty as to footings on each side of party-walls; but the most vexed question was that as to the law of light which materially hampered rebuilding in the City. Hr. Hall's criticisms on the proposed new regulation as to the open space to be left in the rear of buildings were only too weak, for it was a monstrous and iniquitous proposal, and to apply it to old sites meant simple confiscation. He trusted that Parliament would not pass such a clause. In 1884 the late Metropolitan Board of Works brought forward an amending Bill which interfered with so many interests that the board were compelled to withdraw it.

Mr. Alexander Payne, who seconded the motion, feared the new Bill would be so thorough in its changes that it would be years before it was understood, and many more before the lawyers had agreed on its construction and interpretation.

Mr. Arthur Baker, A.R.C.A., and Mr. Ralph Nevill also spoke, the latter pointing out that modern grates packed at the back with fireclay were sources of danger from fire, as they threw out great heat at the rear. He did not share the lecturer's opinion that bay windows and other projections on the building owner's own property should be allowed to be carried down to the ground. He trusted that the new measure would abolish the absurd stipulation that all concrete footings should be stepped.

Mr. E. Woodthorpe referred to the fatal fire at a New York hotel as a proof of the peril attaching to lift shafts in warehouses.

Mr. Arthur Cawston considered that all lifts should be conveyed in separate walls. The present Acts were defective in that while they prohibited half-timbered constructions within a certain distance of property, there was nothing to prevent buildings being erected close to the half-timber work.

Mr. Bernard Dicksee thought all details of house drainage should be intrusted to the district surveyor, instead of being, as at present, left to the officials of the vestry.

Mr. Statham and others having spoken,

Mr. Douglass Mathews held that every detail should be settled in the Act of Parliament, and as little as possible left to be framed in by-laws of the London County Council; still less should be left to the discretion of the district surveyor.

Mr. T. Blashill, superintending architect to the L.C.C., said criticisms were passed on the limitations of the void spaces in buildings, but through these openings, it should be remembered, flames leaped forth when fire broke out, and endangered neighbouring and opposite property. Mr. Hall had put a very extreme case as to the reservation of open space at the rear of buildings; but he held that some such provision for light and air was desirable, and where the restriction would work harshly, the County Council had dispensing power. Under the proposed measure, all sanitary and drainage details would be transferred from the vestry officials to the district surveyors.

Mr. John Slater claimed that many of the suggestions made in a paper he read two years ago had been incorporated in the Committee's suggestions. Mr. Collins, in his defence of the Building Act of 1855, seemed to have forgotten that it had already been often amended. He thought the schedule as to protection from fire needed further modification, especially as to fire-resisting materials.

Mr. T. M. Rickman, co-secretary with Mr. Hall, of the committee which prepared the suggestions, expressed the hope that the points involved would be thoroughly threshed out by the various parties interested—building owners, architects, surveyors, and builders—before the measure became law.

The President, in putting the vote of thanks to the meeting, remarked that if Mr. Collins's arguments were accepted, there would be no building or other legislation. He held that it was most desirable that the various and conflicting Acts regulating building in the metropolis should be consolidated and amended.

Mr. Hall briefly replied, admitting that in several particulars the suggested draft of the committee would be the better for verbal emendation. He had certainly taken an extreme case as to the provision of open spaces at the rear of buildings; but such cases would occur, and his suggestion was based on the illustration given in the County Council's draft measure.

THE SOCIETY OF ARCHITECTS.

An ordinary meeting of this Society was held at St. James's Hall, Piccadilly, on Tuesday evening. The President, Mr. W. H. Seth-Smith, F.R.I.B.A., occupied the chair.

PROTECTION FROM LIGHTNING.

A paper on this subject, illustrated by numerous experiments and lantern views, was read by Mr. Alfred Hands, F.R.Met.S. Having shown that lightning was but the electric spark of the battery on a larger scale, and explained the two electrical states recognised as negative and positive, the lecturer continued:—Although the increase in electrical knowledge has been great in modern times, very little advance has been made in the knowledge of thunderstorms until quite recently. A few years ago, however, the Royal Meteorological Society appointed a committee to investigate this subject, and two reports have already been published. It was thought at one time that thunderstorms were of an erratic nature; but Mr. Marriott, in the last of these reports, has shown that they consist of atmospheric whirls following similar laws to other cyclonic disturbances. He finds that thunderstorms, instead of travelling at a rapid rate over the country as one continuous storm, consist really of a series of storms following one another, and it is his opinion that the average life of each is not more than about 20 miles. This latter discovery alone is most important. At present we have no really reliable theory as to the origin of atmospheric electricity. Various theories have been advanced; but they all appear untenable, and therefore unsatisfactory. Whatever the cause, we know that the air is always in an electrified state, the potential rising as the distance from the earth is increased. It is probable that clouds act only as accumulators of charge, and that the enormous tension evinced in a thunderstorm is caused by clouds acting inductively on one another. One of the noticeable features of a thunderstorm is the heavy drops of rain which fall, instead of the ordinary fine drizzle. Lord Rayleigh has shown the cause of this by a striking experiment. A jet of water is thrown into the air, and is projected on to the screen by a lantern. The drops of water as they fall are fine; but immediately the jet is electrified by a stick of rubbed sealing-wax being brought near to it, the drops coalesce into large heavy ones, similar to those which accompany a thunderstorm. Another experiment, to which we are indebted to Mr. Shelford Bidwell, F.R.S., shows why thunderclouds are heavy and appear sometimes of a coppery hue. A jet of steam being projected on to a screen appears of feeble intensity and of a neutral grey tint; but immediately it is electrified, it becomes dense and dark, and assumes, especially near its edges, a peculiar orange-brown hue. In England we are not so liable to thunderstorms as are the inhabitants of some countries, but nevertheless the amount of damage caused by lightning in this country is very great, and is probably far more than most people who do not take any especial interest in the subject would realise. The invention of the lightning conductor was the immediate outcome of Franklin's discovery that lightning was electricity. He suggested that by laying metallic paths on buildings or ships the electric force could be conveyed harmlessly to earth, and that, consequently, damage to such structures could be prevented. The spread of the use of conductors was, however, very gradual, being largely retarded by religious opposition. Increase in scientific knowledge has overcome these prejudices, and now an enormous number of buildings have been provided with lightning conductors. General ideas as to how buildings should be protected from lightning are, however, very hazy, and consequently an enormous number of the conductors in existence are of very little use, and we often hear of cases where buildings, supposed to have been rendered proof against lightning, are damaged. Paradoxical though the remark may seem, the erection of lightning conductors, even of the most approved type, and the protection of a building from damage by lightning through the use of conductors, may be two very different things. Theoretically, the principle of the lightning conductor is so simple, and based on such well-known laws, that there can be no doubt about its utility; but practically the proper application of lightning conductors is a most difficult matter, and necessitates careful consideration and investigation in order to insure efficiency. If the building to be protected consisted of brick or stone, without a particle of metal in its construction, the matter would be easy, but nowadays, when gas and water pipes are carried about buildings in every direction, besides metal girders and other useful or ornamental metalwork being so largely employed in and on buildings, it becomes necessary to take into consideration the position and quantity of such conducting bodies, otherwise the absolute protection of the buildings is left a matter of chance, and damage may result. A lightning conductor, even if not quite perfect, will still serve to lessen the amount of injury that would result, but this is not sufficient. Protection can be, and should be, absolute, except that rainfall pipes and gutters which are brought into the conductor system may be slightly cracked where the joints do not give good electrical contact. Such nominal damage as this need not be taken into account at all, because it could be avoided, but is not worth the cost of preventing. My experience in testing shows that at least 70 per cent. of the lightning conductors in England are in such an unsatisfactory condition that they afford only partial protection, and damage might occur to the buildings on which they are fixed, while a large number are so absolutely bad that they would give no protection whatever. It is impossible to lay down any definite set of rules by which conductors can be rendered efficient, because buildings differ as much in their construction as do human beings in their appearance and constitutions; and, therefore, two buildings of somewhat similar design might, owing to complications of internal metalwork, require very different methods of protection. Therefore, in describing some of the principal points that require attention for efficiency—points in which conductors generally fail—I merely advance general principles, and each building must be treated separately according to the peculiarities of its position and construction. A lightning conductor may be said to consist of three parts—the main conductor, the elevation rod and point or crown of points, and the earth connection or portion underground. Undoubtedly, the best and most durable form for the main conductor is flat copper band, sometimes called copper tape or ribbon. Being manufactured in lengths up to nearly 500ft., joints, a source of weakness in a conductor, may be almost dispensed with; while, where absolutely necessary (as for branch conductors), they may be made both electrically and mechanically perfect by riveting and soldering. Its flexibility admits of its following closely the irregular surfaces of buildings, and it is also neater in appearance than any other form of conductor. The purpose of the elevation rod and point is important. Under ordinary circumstances, as an electrically-charged cloud passes across the sky, it causes, by induction, a charge of an opposite nature in the earth and buildings immediately beneath it. Before a discharge occurs, this induction takes place, and where the accumulation of induced electricity is greatest, or where the atmosphere is weakest (electrically), the lightning will most probably strike. The action of a point is to prevent an accumulation of electricity by dissipating the charge into the air as fast as it gathers, and so a building provided with a pointed conductor should never get into a condition which would allow of a discharge of lightning falling upon it. This action of points may be thus explained. If an insulated metal ball be charged electrically, the charge will be spread evenly over the entire surface, because its self-repulsive power is equal in every direction. If, however, a point is attached to the ball, this repulsive power is no longer equally distributed. The nearer the point the greater is the force repelling the charge in the direction of the apex, till at the extreme point the force is sufficiently great to overcome the resistance of the air, and the neighbouring particles of dust and air becoming charged and repulsed in all directions, the charge on the ball is dissipated. Professor Tait gives a striking instance of how pointed conductors tend to prevent discharge, as shown by the town of Pietermaritzburg, Natal. This district is very liable to thunderstorms, and a great deal of damage was formerly done in the town by lightning, but since conductors have been erected on the principal buildings, lightning has not struck within the town. Thunderstorms occur in the district, but they pass silently over the town, and only discharge their flashes when they have passed beyond range of the conductors. In practice we find that pointed conductors do sometimes receive a discharge of lightning, for the reason that the charge may accumulate too rapidly for the point to dispel it. When one point will not prevent discharge several may, and therefore a lightning conductor air-terminal should have one stout central point to receive the flash without meeting, if it should strike, and three or four smaller sharp points to facilitate the brush discharge. A church spire or large dome, covered with lead or copper, and provided with a lightning conductor terminating at the point, would be somewhat of the nature of a huge point, and would be less likely to be struck than lower differently constructed buildings. For instance, so long as the conductors on St. Paul's Cathedral are kept in perfect order, lightning would be more likely to fall on one of the smaller pinnacles than on the central dome. One of the most important portions of a lightning conductor is the earth connection. If this is defective the conductor may be absolutely useless, as the discharge might follow some better path, such as a gas or water pipe, and do considerable damage on its way. In ordinary moist soils a good earth connection may be made by attaching to the conductor a large copper plate and bedding it in coke at a sufficient depth to insure sufficient contact with moisture, or if an iron water or gas main is available, the conductor may be connected to it and an excellent earth will result, but the connection must be very carefully made, or, owing to galvanic action, a bad joint will speedily result. In cases where the soil is dry and there are no mains available, the conductor must be taken to a great depth, so as to reach moist earth, or the plate must be increased in size so as to get a larger area of contact with the earth. Electricity, in passing from a conductor to the earth, meets with a certain amount of resistance, and it is in order to reduce this resistance to a minimum that the plate is required. This is in fact a joint in the conductor which requires making good. Professor Tyndall very aptly described an earth plate as a wide door through which the electricity could escape into the earth. It is entirely a matter of surface of metal in contact with the earth, and nothing is gained by having a thick plate. One-sixteenth of an inch thickness is sufficient for ordinary cases. The area of the plate varies according to the nature of the soil. The area protected by a lightning conductor is comparatively small. A spire may be sufficiently high for a single conductor placed upon it to protect the whole building, but a structure with a number of chimney stacks of about equal height may require a conductor from several or from every stack. These need not, however, be independent conductors, but may be branches to one or more main conductors to earth. One of the reasons for so many points of protection being required is that lightning often divides into several branches before reaching the earth, forming forked lightning, each branch falling on some prominent part of a building. The last requisite for efficiency is the relation of the conductor to other metals inside or outside a building. This is the most important point of all, for whereas a conductor might have defective joints, a rather bad earth connection, or other faults, it might still answer if there were no other metals by which the lightning could find a path to earth. If, however, it is perfect in every other respect, but is carried within sparking distance of a gas-pipe or other metal, damage is certain to result. The cause of this is side flash, or lateral discharge from the conductor. If such a spark passes through brickwork to metal inside the building the hole made is generally very small, but the intensity is sufficient to melt and set fire to soft metal gas-pipes, or to do other damage. The distance that such a spark will pass depends upon the intensity of the lightning flash, the amount of the metal near the conductor, and whether it is insulated or connected to the earth. It is therefore extremely difficult to say what is the exact distance that such a spark may pass, but with a conductor of good capacity and conductivity, and having a good earth connection, the maximum length of a side flash to a gas or water pipe would be, at the most, one and a half yards, and therefore any metal at a greater distance than this should not cause side flash. With insulated metal, if not of large extent, side flash should not be nearly so long. Hitherto it has been too much the custom to regard a lightning-rod as a sort of conduit which conducted the electricity, just as rainwater gutters and spouting carry off rainfall from a building, and its physical effects have been somewhat overlooked. We must bear in mind that all the metals about a building are conductors of electricity, and are therefore subject to intense inductive action, so that their condition and effect in the event of the lightning conductor receiving a discharge of lightning must be duly considered. It is no argument against the use of lightning conductors that these physical effects occur. We only require to know their nature and effect in order to guard against them. It is merely a proof that lightning conductors, to be absolutely perfect, require to be scientifically applied. There are two methods by which these effects can be avoided. One is to connect all metals with the conductor. So far as the outside of the building is concerned, this rule holds good—that is to say, any metal near the conductor should be brought into metallic contact with it. As regards the interior of the building, however, this is not always advisable. Apart from the objection there would be to having walls pierced for this purpose, there would be the danger of the connected metal coming near to other metal which was not connected, and which would therefore be at a different potential. For instance, if hot-water pipes were so connected there might be some point where they came near a gas-pipe, and there a spark might occur and set light to the gas. A better system is to study the position of the various metals, particularly gas and water pipes, and to so place the conductor that the lightning discharge may be led quietly away to earth without affecting the metals inside the building. After the conductor is fixed these physical effects should be so far borne in mind that the space inside the building near the conductor should be remembered as a dangerous one in which to place metals, and, especially, any alteration to the gas or water system should be carried out with due regard to its effect on the conductor. A necessary way to insure the efficiency of a conductor, but one generally very much neglected, is to have it periodically examined and tested. It should be carefully tested by means of a galvanometer and set of resistance coils to see that the resistance in every part is sufficiently low. Joints may get bad, the continuity of the conductor may even be broken by ignorant workmen repairing the building, and the underground portion may decay. Such faults as these the galvanometer will reveal and allow of their being made good in time. The building should also be carefully inspected to see that no metals have been so placed as to cause lateral discharge. The lecturer, in conclusion, referred his audience to the well-known and excellent Report of the Lightning Rod Conference, published by Spon's, which had, he remarked, done much to improve the system of applying lightning conductors.

At the conclusion of the paper a vote of thanks was proposed by Major F. S. Leslie, R.E., and seconded by Mr. H. Roumieu Gough, Past-President, and was supported by Mr. Robert Walker, of Cork, ex-President; Messrs. Manning, A. F. Finch, and R Cruwys and the President. Mr. Hands replied at considerable length on the various points raised.

THE ACTION OF HEAT FROM OPEN FIREGRATES, STOVES, AND HOT-WATER PIPES.—IV.

By F. Dye.

From hot-water pipes we have the same action as from stoves, viz., radiation from their outer surface, and air warmed by contact with them; both these actions, however, are weaker, and this renders them more agreeable. Of course, a greater surface is required with hot-water pipes than with stoves to heat a room of a given size. With hot-water pipes we get a very agreeable heat, in fact, we get the result that is partially obtained with the "gill" stove explained in the last paper. We get a large volume of heat at a medium temperature, instead of a smaller volume at a higher temperature.

With hot-water pipes there is no occasion whatever to provide means for moistening the air, the heat is evolved too gently and naturally for that, and it is the general opinion that with this kind of heating appliance we receive more heat by radiation than by convection. There are exceptional instances where vaporising pans and troughs have to be provided, even in living apartments, and, as before mentioned such provision has always to be made in horticultural works; but for general residence work, or for warehouses, lecture-rooms, &c., no such provision, as a rule, is called for.

In saying that we receive heat from hot-water pipes by both radiation and convection, it is supposed that the pipes are exposed, and not in pits, chambers or even in channels; neither should they be encased in any way as the old form of pipe coil usually is. So much of the effective heat is lost or rendered ineffective by hiding the pipes in any of these ways, that the practice should be avoided wherever possible. The new pattern "radiators," which are practically ornamental forms of coils, have been introduced chiefly with the idea of obviating what has just been referred to, as their appearance is such that they may be stood in full view almost anywhere, if they are suitably coloured and decorated.

Almost any mode of hiding hot-water pipes must have a prejudicial effect upon results in two distinct ways. The first is that we may lose all or nearly all the radiant heat, the value of which has been already dwelt upon. Take the pipes in a church, which are usually carried in channels with an iron grating over. Even with these we get but little radiant heat through the grating, and what does come through is projected into space and does little or no good. The heating in such a case as this is done, we may say, wholly by convection, and so it is with th other methods adopted to hide the pipes. O course, in numbers of works the pipes must b hidden, there may be no way of obviating it In such cases, as every engineer knows, a greate allowance of pipe is made to heat a certain are than if the pipes were exposed. This is how th difficulty is overcome, but, of course, it does no seem right that any waste of heat and extra expense should occur.

The other and possibly greater objection t placing pipes in channels, pits, or such obscur places is the certainty of their being allowed t get dirty, that is, have a coating of dust, mor or less thick, upon them. Now, dust has a objectionable feature when it settles upon stove and such highly heated surfaces, by creating a odour, as was explained in the last paper. Thi objection, however, does not exist with ho water (low-pressure) pipes as the heat is insuf cient to scorch the particles in the way describe The trouble, therefore, that dust causes wit radiating surfaces heated by hot water is th the particles consist, we may say, wholly a solely, of poor heat-conducting materials, piec of wood, wool, fibrous and strawlike material grit (silica), and various other organic and ino ganic substances, that do not conduct heat at a readily. Consequently, a coating of dust ac just like a coating of any of the materials th are occasionally used to prevent dissipation radiation of heat. The surface of the pipe its is ready to discharge its heat, but the mater resting upon it is opposed to its passage.

There are two remedies for this state of thing one is to keep the pipes clean, which, howeve is not done at all willingly or frequently, as may entail removing large quantities of grating &c., every time. In many cases those who tend to the pipes in, say a church, are ignor of the harmful effect of the dust, and the pi are only dusted when the accumulation can be seen through the gratings and does not look well. With coils in cases this remedy is not usually possible, as the cases, the ornamental structure provided to inclose and hide the unsightly coil, cannot be removed except by a workman. It would be possible, however, to dislodge the dust with a pair of bellows.

The most common method adopted now to remedy the trouble caused by a lodgment of dust on pipes is to use coils in which the pipes are fixed vertically, that is, upright; dust cannot very well lodge on these at all thickly. This remedy is, however, very limited in application, for it is quite impossible to place the pipes in anything but a horizontal position in almost the majority of cases. The new form of coils known as "radiators" have all upright pipes, with this object in view.

With a hot-water apparatus carried out upon what is known as the high-pressure system the water, and consequently the metal of the pipes, attain a fairly high temperature, sometimes 450°. With the pipes of the ordinary low-pressure system we seldom get more than 200°. This difference in temperature is often referred to as an objection to the high-pressure system, owing to the greater heat-giving results somewhat approaching stove heat. This, however, is not strictly correct, for the temperature named, or even 500°, is not sufficient to scorch the materials composing the dust which settles upon the pipes, and the disagreeable odour is not perceivable. Neither does the high-pressure system bring about a dryness of the air sufficient to be objectionable for ordinary purposes.

Although the high-pressure system of hot-water works diffuses heat in the same two ways (radiation and convection) as both stoves and low-pressure water works, it is very seldom indeed that the radiant heat is projected into the apartment, as the pipes of this system are, we may say, invariably hidden or covered in some way, usually behind skirtings or else in cases. This style of apparatus answers well for hot-air works, that is, heating air in a chamber from when it is conveyed by pipes or conduits to the points desired. For this purpose it is a little more effective and rapid in results than a system of low-pressure pipes, yet it does not require the precautions or have any of the possible disagreeable effects of stove heating.

It is always necessary for hot-water pipes to be painted or coated with some material wherever they may be situated, and special need for this arises with the modern radiators referred to, as these being intended to stand in view, with possibly good surroundings, they frequently have to be decorated in an artistic manner with two or three tints or colours. Now, there is a notion somewhat prevalent that colour affects radiation; this, however, is practically incorrect as regards non-luminous rays of heat, and we never get luminous rays from hot-water pipes (nor from close stoves). Doubtless the idea is due in a great measure to the fact that as lamp-black is an excellent radiating material it might follow that colours ranging from black to light might also range in ratio in their powers of radiation. This would be a natural conclusion, especially as lampblack is classed as the most efficient radiating media we have.

The scale of radiating powers of different substances is as follows:—Lampblack, 100; white lead, 100; plumbago (blacklead), 75; cast iron, rough, 60; film of oil, 60; iron, polished, 25; copper, polished, 7.

It has to be impressed upon the reader that, by the radiating power of materials is meant the property of diffusing or projecting heat from their surface or skin, and it must be clearly understood that it is in no way related to the action that may take place in the substance of the material. To make this clear, let us suppose that we coated a hot-water pipe with a ¼in. thickness of lampblack; this would give poor results, as lampblack, although possessing excellent radiating qualities, is a bad conductor of heat, and consequently the heat from the pipe would be retarded by the thickness of the black, and very little would get through to the external surface to be radiated. To get effective results, we have to apply the lampblack as a thin coating, then we have the heat from the water readily transferred through the metal of the pipe by the excellent conductive properties of iron, and when it reaches the outside of the pipe the lampblack will do what is required in projecting the heat into the room. This is effected by the black being applied sparingly and merely acting as a skin to the pipe.

Lampblack, notwithstanding its good qualities in this direction, can only be used when the pipes are hidden or occupy non-important positions. When it is permissible, it is desirable to use it, and it should be applied as a water-color, that is, washed on. For radiating pipes, particularly radiators, occupying conspicuous places, it fortunately happens that oil colours and varnishes, if applied sparingly, give very nearly as good results as lampblack, and this permits us to decorate the radiating material as tastefully as we desire, without impairing efficiency.

With non-luminous rays of heat the colour of the radiating medium makes no difference in the amount of heat given off, but the materials composing the colours do. From the table given it will be seen that oils are efficient radiating material and all oxides and such colouring materials are as good, and we may very safely decorate coils, &c., with ordinary oil-colour paints, and the gums and shellac used in the manufacture of varnishes have no objectionable features in particular.

Polished metallic surfaces are very bad heat radiators. A copper kettle, for instance (see table just given), will permit of the water within it retaining heat much more efficiently if polished than if soiled and dull. A coating of soot on a copper kettle will make a considerable difference in heat retention, the soot being lampblack to all intents and purposes; it is a good heat dissipator.

As a polished surface is opposed to radiation, it follows that all bronzing and gilding or nickel-plating of radiators is likely to give bad or at least less efficient results, and such is really the case. There is no grave objection, however, to having bronze or gilt lines and reliefs on the projecting members of the castings, but if they can be avoided it is as well, especially as experience will prove that this kind of decoration is inclined to produce a gaudy effect, and is not usually considered to be in such good taste as an arrangement of colours only.

In conclusion, it may be mentioned that as hot-water pipes and coils contribute a fair proportion of their heat by convection, that is, by heating the air that comes in contact with them, it follows that the most suitable position for such things is the point where the inflowing air enters an apartment, this usually being the doorway. It is a common and a very desirable plan to heat rooms, when they are of good size, by both open fires and hot-water pipes. By this means there need not be an extravagantly large fire kept, but its cheerfulness and other good features are not absent. As mentioned in the previous papers, when an open firegrate is in use the draught of the chimney induces a somewhat keen inflow of air at some point in the room, and it is usually the doorway that furnishes it unless any special provision for inlet ventilation exists. This inrush of air, as everyone knows, renders the room unpleasantly draughty by the door, and also across the room from the doorway to the fireplace, necessitating the use of screens, which, however, only divert the current of air from the direct course it was pursuing. The advantage, therefore, gained in introducing hot-water pipes is that by placing them so that they intercept the air as it enters we impart heat to it, and the unpleasant results explained disappear, and further than this, the heating of the air causes it to take a somewhat less direct passage from door to chimney, and this is a desirable end attained.

It is rather peculiar to note what a number of houses exist with spacious and lofty rooms, yet which (rooms) only have one fireplace in them. In most cases the fireplace is totally unable to heat the room except just at the end where the fire is situated. In other cases the grate may be large enough, but then the heat in the immediate vicinity of the grate itself is intolerable. A grate situated at one end of a large room, yet large enough to heat the whole of the room, gives out an unbearable temperature at the part of the room where the grate is, and a fire of this kind would make an unbearable degree of draught at the doors, &c. With such rooms as these there ought to be two fireplaces, one at each end, or, better still, introduce a coil or radiator by the doorway where the draught enters, as just explained, and this will result in an equable temperature, for the doors are nearly always at the opposite extremities to the fireplaces.

As fireplaces and other causes go to induce an in-passage of air at various points in a house, it is worth a thought as to where this air enters in the first place. In almost every case where no special provision exists it will be found that the front and back outer doorways, which open into the entrance-hall and passages, are the points where the air first enters, and from these points it passes to the different rooms both down and up stairs, and furnishes the needed supply for all purposes. Owing to this, it becomes an excellent and always satisfactory plan to have coils or radiators in the entrance-hall where this fresh and cold air enters. By this means it can be given a more agreeable temperature, and wherever it passes afterwards it will tend to comfort and go a great way towards making all parts of the house warmer. This arrangement gives warmth to the staircases and landings, which are commonly very chilly; and as a hot-water boiler can be easily kept going all night, the unpleasant degree of cold felt in the early morning is quite obviated.

ELECTRIC LIGHTING IN THE CITY.

ELECTRIC lighting in the City is rapidly becoming an established fact; ere long we may hope to see the pale beams of the electric lamp shining in every part of the Lord Mayor's dominion. When this is accomplished, a wonderful stimulus will, no doubt, be given to the lighting of shops and warehouses in the same way. Already the Corporation of London have taken advantage of the opportunity of being able to obtain the electric current from the main near the Mansion House, so that Lord Mayor Evans has now the pleasure of seeing the electric light illuminate the Mansion House and other parts of his official residence. When a former attempt was made to light the Mansion House by electricity much annoyance was experienced from the vibrations caused by the generating engines which were situated in the basement. All this is now avoided by the new arrangement. Under the guidance of Mr. W. H. Preece, F.R.S., the Commissioners of Sewers have for some years been making themselves familiar with the possibility of electricity being used for lighting purposes in the streets.

Mr. Preece has considered the measurement and distribution of electricity, together with the cost of its production. On all these points experiments were successfully made, and afterwards explained in a report issued in 1884. Mr. Preece had the advantage of testing the powers of electric lighting by the experience gained in illuminating several miles of streets at Wimbledon, where, undoubtedly, the electric lamp exhibited a remarkable contrast to the oil lamps used for illuminating that town. Besides this, he lit up his own residence by the aid of the electric current, utilising the services of his gardener in attending to the machine generating the electricity, which was placed in a shed in the garden. Thus, by a happy combination of duties, this man was able to assist in producing light for the house, as well as fruit and vegetables for the table.

After some considerable thought and trouble, Mr. Preece succeeded in establishing a standard by which the electric light could be measured, looking out for an instrument by which he would be able to determine the arithmetical ratio between the light to be measured and this standard. Strange to say, he gained an excellent idea from the fairy lamps used at the Savoy Theatre in "Iolanthe." To use Mr. Preece's own words, "One of these lamps was placed inside a small box, the top of which had a screen of white paper, on which was a grease spot. I was able, by diminishing or increasing the current of electricity producing the light, to vary the illumination of one side of this grease spot. When it was desired to measure the illumination of any space, such as the surface of a street, the box had simply to be put at the place to be measured, and the current had to be regulated till the grease spot disappeared. The current of electricity then became the measure of the illumination, and a single table gave the result in terms of the new standard."

In considering the distribution of light it was ascertained that a very large quantity of the light from gas-lamps is wasted in the sky. This waste is very forcibly seen in the case of lamps placed on the parapets of bridges, where more of the light is given to the water and the sky than is given to the roadway. Mr. Preece considers it to be a barbarous practice to cover the light with an opaque or semi-transparent shade;

this is remarkably seen in the fact that an arc lamp giving a light of 1,000 candles per horse-power is sometimes toned down by absorption and obstruction to less than 250 candles. The lighting of parts of the City by electricity some few years since was only of an experimental nature, and did not then prove a success; the work in hand at the present moment will stand as a permanent addition to the advantages which the City already enjoys in the matter of street illumination.

For electric-lighting purposes the City is divided into three districts—the central, west, and east districts. The central and west districts—that is, from the Mansion House to Temple Bar—are being illuminated with electricity by the Brush Company; the Laing, Wharton, and Down Syndicate Illuminating Company the east district.

Two kinds of lamps will be used by both companies, in the main thoroughfares arc-lamps will be placed. These will be of 2,000 candle-power each; the height of the poles on which they are placed being from 18ft. to 20ft., and will be placed on both sides of the streets at a distance of 150ft. apart. Certain small streets, lanes, and alleys will be lit with incandescent lamps, so that no spot in the City will remain in darkness. The incandescent lamps will generally be of eight-candle power.

The Brush Company has engaged to provide 282 arc lamps and 600 incandescent lamps; but the station of the company will be fitted so completely with apparatus for generating the electric light, that it will be able to supply 800 arc lamps and 240,000 incandescent lamps.

The present installation of the Laing, Wharton, and Down Syndicate has a working capacity of 50 arc lamps and 4,000 incandescent lamps; but when the central station is fully equipped this will be increased to 600 arc lamps and 116,800 incandescent lamps.

The Laing, Wharton, and Down Syndicate are working on the Thomas-Houston system, about four miles of cables being at the present moment drawn into the conduits prepared for them.

The Brush Company's central station is at Bankside, the Laing, Wharton, and Down Syndicate at the Old Wool Quay by the Custom House; and in both these stations the batteries, engines, &c., are of the most elaborate character, so as to prevent the accidents which so often made former attempts in electric lighting a failure.

Gas companies have long viewed with alarm the growing favour of the electric light with the public at large. In the City many attempts have been made to put off the evil day by a voluntary improvement of street lamps. In 1889 the Gas Light and Coke Company erected at their own cost as many as 112 lamps in the City, most of which gave out an illuminating power of 75 candles. The Defries Safety Lamp and Oil Company also made experiments with lamps burning ordinary petroleum oil; in Holborn-viaduct 18 lamps gave an illuminating power of 20 candles, while 12 lamps in Holborn-circus had a brilliancy of 100 candles. It should be remembered when estimating these experiments that the ordinary lamps in the City have batswing burners, consuming 5c.ft. of gas per hour, and have an illuminating power of 14 candles.

None of these experiments have been able to dissuade the Commissioners of Sewers from their belief that electricity is superior to all other agents. Indeed, one has only to stand at the junction of Cannon-street with Queen Victoria-street to see at once the great advantages of the new system. In Cannon-street we have a dirty yellow flame, which in comparison with the electric light looks dull and dismal. The lamps in Queen Victoria-street send out a clean, brilliant light of uniform distribution. Among the many advantages of electric lighting, one of the most important is that in the case of sudden fog it can be turned on without delay. That this is not an imaginary blessing, we may learn from the fact that in the City in 1890 the gas was lighted no less than fourteen times; nor should we fail to remember when we are looking upon a defective electric lamp that in one year there were no less than 685 defective gas-lights in the City.

The advantages of electricity for lighting purposes are experienced chiefly by those who use it for domestic purposes. Besides the natural character of the light, we have the absence of heat and all destructive gases; the pictures on our walls and the decorative adjuncts of our homes are not destroyed, the air is not vitiated, and longer life will therefore be one of the many advantages which the electric light will bring to us.

In the arc lamp the electric current passes between two carbons; the light is, therefore, produced by the disintegration and combustion of matter. In the incandescent lamp we have a thin carbon filament inclosed in a hermetically-sealed vacuminous tube, so as to prevent oxidation; this is made luminous by the passage of a strong current along it.

To trace the history of electricity would be too formidable a task in this short article, for from the time when the ancients found the attractive power of amber, and so gave to this wonderful force the name of electricity, to the time when Benjamin Franklin astonished his friends with the wonders of the Leyden jar, or brought down electricity from the clouds—between these two periods wonderful slides were made in our knowledge of electricity. It is, however, only of recent date that any attempts have been made to utilise the electric current for the illumination of our streets and our homes.

It was Sir Humphry Davy who, in 1802, produced an electric light with carbon points. In 1810, at the Royal Institution, a brilliant light was seen when a disruption of a continuity of the electric current from 2,000 cells. This was called the "Voltaic arc."

In 1858 the inhabitants of London were startled by seeing the works of Westminster Bridge illuminated by Watson's electric light. The advantages of the light were soon seen when it was applied to lighthouses, and a trial took place in 1857 at Dungeness, and two years after Professor Holmes' magneto-electric light was used in the South Foreland Lighthouse, Dover. The commissioners appointed by the Trinity House to consider the uses of electricity in lighthouses reported "that electric light is the most powerful under all conditions of weather, and that it possesses the greatest penetration in fogs."

In 1878 Westminster Palace and the Gaiety Theatre were lighted by electricity; but the greatest stimulus was given to electric lighting by the invention of the Jablochkoff candles. From 1878 to 1881 the Avenue de l'Opéra, Paris, was illuminated in this way. The light given out was 24 times that of gas, 64 Jablochkoff candles replacing 300 gas burners, and thus rivalling

> "Those gold candles fixed in heaven's air."

Since that time many inventors have been at work—the names of Edison, Weiderman, Brush, Siemens, Swan, and others crowd upon the memory, all these trying to arrive at the same goal by different roads.

The usefulness of the electric light will not be exhausted when our streets are illuminated by its rays; the risk of accidents in our collieries will be greatly lessened when the mines are lit up by electricity. The photographer uses it to take photographs, and the medical man does not refuse its help, for by its rays he is enabled to work marvellous cures.

The electric light has been used for lighting up the cavities of the throat, and even a delicate operation in the stomach has been performed by its assistance. In 1867 Dr. Bruck, a dentist at Breslau, produced an apparatus for lighting up the buccal cavities; this he called the stomatoscope: while Sir Henry Thompson also explored the bladder by the aid of the electric light. One of the great advantages of the electric light will no doubt be the prevention of crime; dark deeds will hardly be performed under its rays, and in this way it will prove one of the most civilising agents of modern times.

ROYAL SCOTTISH ACADEMY.

THE sixty-sixth Exhibition of the Royal Scottish Academy will not take its place as in any way remarkable, containing no pictures of surpassing interest, and perhaps a larger percentage than usual of those hardly worthy of a place in the galleries. These, however, always serve a useful purpose in filling up odd spaces, and may have interest for many as efforts made to reach a higher standard. The total of works of art exhibited is this year 831, arranged as formerly—with water-colours in the north or entry room, oils in the octagons and great room, and the architecture and sculpture in the north room; the architecture being somewhat less than usual, a good many-oil paintings have found a place also in the north room. The most interesting features of the galleries is a collection of the works of the late president, Sir George F. Douglas. Most of them are small subjects, and yet the 36 oil-paintings occupy considerable space in the great room, where they are put in a good position and together. The water-colours, to the number of about 20, are not large pictures. The samples of his style are mostly figured subjects, and their interest centres often quite as much in the accessories which furnish and fill up the scene, as in the attitude or expression of individual character. In all his studies the artist has aimed at, and succeeded in, delineating every detail, the most minute, with great fidelity, and never fails to give a vivid impression of the story his picture is designed to tell. In every case he does so with finely studied harmonious colour of subdued tone, which suits his favourite subjects. These are of some variety—pathetic, humorous, but mostly of a kind which attests the artist's love for and extensive acquaintance with antiquarian researches. 183, "The Summons to the Secret Tribunal," an incident in the life of the anatomist Vaselius, is as good as many another of the artist's work of this description. The doctor is represented as startled by the entry of the officers of the Inquisition, and has drawn his sword to resent the intrusion. On his table are heaped up a great variety of odd and curious specimens, with which the imagination of the artist has supplied it. 188 "The Alchemist," 204 "The Rosicrucians," and 205 "The Arrest of Pietro d'Apone," are all perfect studies full of suggestion to those learned in antiquarian lore. 169, "Hudibras and Ralph Visiting the Astrologer," and 199, "Hudibras and the Lawyer," are humorous subjects, as also 191, "Dean Swift and the Errand Boy," which is a masterpiece of art. The Irish gossoon is seated laughingly in the doctor's chair, and from that position suggests half-a-crown as his reward for bringing the hare. The dean, a little figure in black, with large head and vinegar expression of face, is teaching the urchin manners, holding the hare in his hand when presenting it with a bow. There is excellent figure-painting also in some pathetic subjects. His landscapes are few—views of Stonehaven, long and narrow in their dimensions—sort of telescopic views—allowing minute graphic delineation. He seems to have kept clear of anything like sylvan or rural subjects; but the perfection of his works will doubtless place him high on the roll of distinguished Scottish artists, despite the somewhat narrow range of his artistic efforts. The new President, Sir George Reid, has several pictures, all, however, in the line of portraiture. A likeness of the late president is a small picture, but a most life-like portrait; 147, portrait of R. C. Maclagan, M.D., and 186, are large full-sized presentation works; 266, "Portrait of Professor Tait," painted for presentation to the Royal Society; 282, portrait of Sir W. M'Onie, Lord Provost of Glasgow, are all treated with the artist's usual skill. The galleries have only one feature by Sir. J. E. Millais, "The Lively Miss Muffett," familiar to the public. Alma Tadema has two subjects (103) "An Audience with Agrippa," and (341) "Portrait of Paderewski," both of which present much of interest, and much of his usual felicity of touch.

The general portraiture of the exhibition is not so large in bulk as usual, and some are but indifferent specimens. 514, "Portrait of John Elder, S.S.C.," by J. A. Ford, is an excellent work in attitude and colour by a younger artist. Beattie Brown, R.S.A., sends a large number of landscapes, all evidencing his taste in the selection of his subject, and marked with his usual softness of touch and natural, if somewhat sober, tone of his colours. 16, "A Highland Glen," with mist on the distant hills, and an evening sky, are admirably rendered; 246, "Ellandonan Castle," is notable for the luminous rendering of its sky, light, and shade. 301 and 385 are sketches on the Blackwater, Ross-shire. Mr. J. Smart, R.S.A., sends all his full complement of seven pictures. 96, one of his largest, "Ploughing the Summer Fallow, Menteith," is a very careful study of the subject; the ploughman and his horses are true to nature, and the landscape shows the breadth of level expanse the artist delights in; he has been more successful with his sky and figures than with the furrows of the field, and the picture is, like many another, too large for a subject with so little in it. 454, "Waiting for a Shot," is one of his best; the figures and the forest trees are admirably rendered. Waller Paton, R.S.A., has fewer this year. 291, "Kirkwall Fair," 1873, appears to be a picture in oil closely resembling a water-colour in a former exhibition. It is an attractive subject as handled by the artist, who has placed the cathedral as a background, perhaps with some little exaggeration of its height, in dim outlines against the evening sky, the fair lighted up with lanterns, and revealing a motley collection of shows and caravans, and a crowd of holiday-keepers, with faces all aglow and in enjoyment of the scene. His other landscapes present good samples of his characteristic manner. Alex. Frazer, R.S.A., has five subjects. His landscapes, with the deep greens and somewhat hard and patchy method of laying on his colour, are familiar to the public. M. McTaggart, R.S.A., has three works, figure subjects—278, "The Fisher"; 290, "Spring"; and 431, "The Golfer." All these figures are presented with the charcteristic vigour of the artist, but his skies are unfinished or opaque, with too much solid white. Mr. W. D. Mackay has five landscapes of rustic subjects, nicely handled. Mr. Austin Brown, R.S.A., has also several excellent works of scenes in country life. The exhibition contains also a large number of excellent landscapes by younger artists or amateurs.

Of pictures representing historic and other incidents, there are several, of much interest and excellence in delineation. 387, "Cromwell looking at a Portrait of Charles I.," by G. O. Reed, R.S.A., is well conceived, and painted with good effect. There is feeling in the Protector's face; but the figure of his daughter beside him is not so carefully rendered. 405, "Attack of the McDonalds at Killiecrankie," by Harrington Mann, is a large work, and powerfully rendered. Two Highlanders, with claymore and target, are rushing over the rocky path to meet the foes, while a crowd of other forms in the background are advancing, armed with various weapons. The scenery is wild and desolate. 86, "The Cleansing of the Leper," by W. Hole, R.S.A., is a landscape with figures. The principal figure is relieved against a lofty, wooded bank, and the leper is kneeling in the foreground. 209, "The Canterbury Pilgrims," represents the cavalcade leaving the city, the tower of the cathedral appearing in the background. Each figure is drawn with much individuality of character, and with characteristic costume. G. O. Reid, A.S.A., has a number of very interesting subjects of homely life, of which 218, "The New Laird," is the best and most elaborate in its details. The new laird is calling on his tenantry, and may be getting hints towards reduction of the rent. 339, "Crofter Home, Cullaigh, Arygleshire," by Kate S. Brodie, is an excellent work which was worthy of a better place. 363, the "Convalescent," by James Archer, R.S.A., is rather formal in its composition, one female standing at the foot and the other at the head of the sofa on which the invalid is reclining, and looking up with something of hopefulness in her expression. 410, "Cornet Graham and the Curate in Neill Gow's Change-house," by Charles M. Hardie, is one of three sent by the artist, and expresses forcibly a rather rollicking specimen of the cloth and the soldier-like bearing of the other, both taking their refreshments in the way of liquor. The other two are portraits. In the collection there are also a number of excellent animal subjects, by R. Alexander, R.S.A., J. Donovon Adams, and others. Hugh Cameron, R.S.A., has three of his delightful pictures of children, with shining, merry faces, on the sea-shore at play. The exhibition contains a picture by J. Lavery, which is much admired for its admirable drawing and modelling of the figure. The subject is "Ariadne," semi-nude, with thin drapery hanging down in graceful folds to her feet. She is represented with her back to the spectator, looking out over the sea after the faithless lover has left. 84, "An Irish Girl," is another work of the same artist, with finely expressed features, but much monotony of colour. There are also what may be designated not a few very peculiar specimens of artistic work. 144, "Landscape," by E. A. Walton, represents a huge poplar of very ungraceful shape, and little more but indescribable landscape in the abstract, and a very cloudy, misty sky. 309, Galloway landscape by George Hemy, and 310, "Pastoral," by James Grittin, are both specimens of this blotchy style of work. The school is said to be developed in the west, and has been called the Impressionist school, but nobody seems to understand the purpose of the style, which, with one feature of the subject perhaps carefully portrayed, leaves all the rest indefinite.

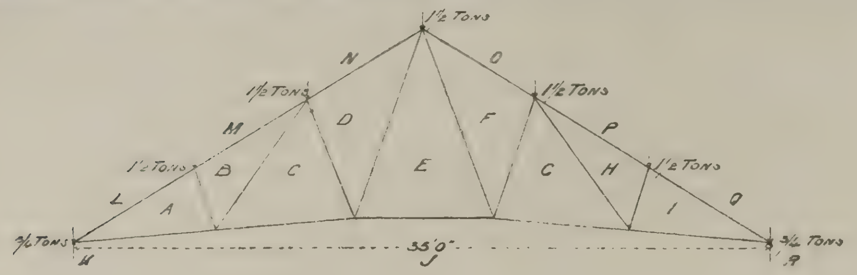
The water-colours are, many of them, very excellent, and those by the late president, though small in scale, are specially interesting. 703, "Stonehaven," is very similar in character to the same subject in oil, and others are quiet country scenes or sea-scapes.

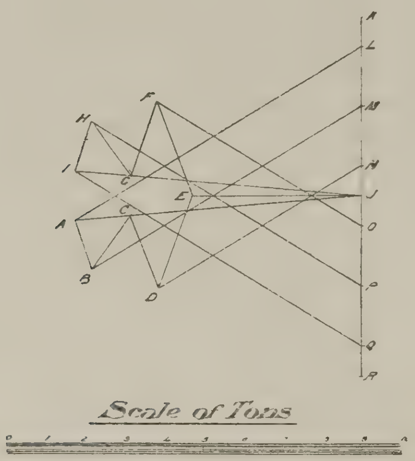
There are several very fine specimens of etching, and a few miniatures.

The sculpture comprises about 40 pieces, ranged in the usual regimental order. A larger and smaller statuette of Burns, both give the usual and well-known figure and impression—the larger by G. Lawson, H.R.S.A., and the other by James H. Kerr. J. Stevenson Rhind sends a speaking likeness of the Rt. Rev. J. McGregor, D.D., and his "Maid of Athens" (582), is a very finely modelled work. 568, D. W. Stevenson's bust of the late Mr. Wm. Nelson is a very good likeness, as also Geo. Webster's bust of the late Mr. John Livingstone

BOOKS RECEIVED.

Architects' and Builders' Pocket-Book. By Frank Eugene Kidder, C.E., &c., illustrated. Ninth edition, greatly enlarged. (New York: John Wiley and Sons. London: Gay and Bird, King William-street, Strand.)—This comprehensive handbook, so well known and valued in America, has been so revised and enlarged, that it presents almost a new book, many of the chapters having been rewritten. For clearness of type and illustration, completeness, and arrangement Kidder's work surpasses many of the pocket-books published. For those of our readers who may not know it, we may say that it contains in its three parts every kind of mathematical, mechanical, structural, and scientific information that an architect or engineer can want. Part I., on practical arithmetic, geometry, and trigonometry, with rules, tables, and problems, is a very complete treatise on practical mathematics. Part II. deals with the "Strength of Materials and Stability of Structures." It treats of foundations, bearing-power of soils, rules for loads, chimney foundations, masonry, walls, retaining-walls, strength of masonry, stability of piers and buttresses (showing the graphic method), arches and their graphic solution of stability, resistances to tension, columns, strength of beams of wood and iron, wood and fireproof floors, including various methods of construction, fully illustrated by sections; roof trusses of wood and iron, withi llustrations from well-known roofs; chimney construction, including a variety of rules and tables useful in designing and estimating under. Part III. has a list of noted architects. Many valuable notes and data, heating, forms of contracts, &c., are to be found in this useful handbook, which summarises all the more valuable treatises of construction, including Notes on Building Construction. No fewer than 500 engravings are given. The pocketbook will be found a veritable *multum in parvo* of construction.——*Transactions of the Royal Scottish Society of Arts*, Vol. XIII., Part I. (Edinburgh).—This useful record of the Royal Scottish Society of Arts includes "Notes on a Method of Testing Steam Boilers," by T. Hudson Beare, B.Sc., F.R.S.E.; "Notes on the Early History of the Steam-Engine," by W. Allan Carter, C.E.; remarks on the "Kettering Sewage Works," by W. Fairley, Assoc.M.Inst. C.E.; "Ventilation of Schools," by W. Buchan, S.E., &c.; and a very interesting paper describing and comparing the "Methods of Electric-Lighting in Use in London," by Alex. B. W. Kennedy, F.R.S., Professor of Engineering in University College, London.——*The Public Health (London) Act*, 1891, with full explanatory notes, &c. By E. Lewis Thomas, M.A., LL.M., of Lincoln's Inn, Barrister-at-Law. (London: Knight and Co.)—This well-edited volume will be found a very valuable handbook for all officers, law and medical, of sanitary authorities, the vestries, and district boards of the Metropolis. The summary of the Act itself we have given. It is only necessary to speak of the manner this edition of the new Act has been prepared. Mr. Thomas has not only given the full text of the Act, which codifies and amends all sanitary enactments in London, and provides a code of laws which have been in operation since 1875 for the rest of the country (the Public Health Act), but gives full explanatory notes following the clauses of each section, in smaller type, by which the reader, after reading the section in its entirety, can consult the notes of interpretation. One valuable feature of this handbook of the Act is that references are made to all sections of the older Acts that have been reproduced or amended immediately after each section of the new Act, and a comparative table of the repealed enactments and sections of the Public Health Act, 1875, corresponding to those of the new code is given, by referring to which the official can see at a glance the provisions in the Act which correspond to those of the repealed Acts so familiar to him; and when we say that more than 30 of these have been repealed and re-enacted, including the Nuisances Removal Acts, Sanitary Acts, Metropolis Management Acts, Police and Smoke Acts, &c., the importance of such reference in a form easily consulted is obvious. Lists of cases and statistics cited are also given; also an exhaustive index, prepared by Mr. Ernest Gardner, Barrister-at-Law. In the appendix will be found the texts of the various existing Acts. This volume is absolutely necessary to every medical officer, inspector, architect, surveyor, and engineer in the Metropolis.——*Progress of School Design and the Origin of Certain Features found in Local Schools.* By Anthony R. F. Trew, M.S.A., Architect.—Mr. Trew, in a small pamphlet, describes certain new features in the planning of elementary schools in and around Bristol. The Windmill-hill Board School, built in 1884 from J. W. Trew and Son's designs, introduced the plan of one large room for each department, divided by sliding screens into four class-rooms, and many new schools have since reproduced some of the special features. Cookery was taught in a room specially built, a teacher's room with lavatory to each department was added for the first time, cloak rooms and lavatories were made separate rooms, hot-water coils were put under the racks to assist in drying the clothes. Another improvement was to introduce "ventilating hot-water coils" in recesses under the windows, by which fresh air could be admitted from the outside. The principal and most useful of the features described is the sliding-screen or partition. The sliding-screens are now to be seen in nearly all the old Board and other schools in Bristol, and the author justly regards these reproductions as complimentary rather than a procedure to be condemned.——*A Manual of Physics*, by William Peddie, D.Sc., F.R.S.E. (London: Baillière, Tindall, and Cox, King William-street, Strand), is a very well-arranged and comprehensive handbook admirably suited to the general student of physics. In this manual Dr. Peddie, Professor in the University of Edinburgh, has inculcated the principle of the interdependence of the various physical sciences. He is not content to give dry results, but to explain the theory or hypothesis upon which each proposition is founded. The methods of physical science are to this end clearly laid down in Chapter II., and the next chapter treats of the theory of contours and its physical applications. The laws of motion, gravitation, properties of gas, light, and heat are ably treated, but the mathematical portions might have been simplified. The engravings are numerous and well chosen. For the use of university students Dr. Peddie's manual is admirably suited.——*Lockwood's Builder's, Architect's, Contractor's, and Engineer's Price Book for* 1892. Edited by Francis T. W. Miller, A.R.I.B.A. (London: Crosby Lockwood and Son), maintains its repute as one of the best price-books. The volume, which was lately re-written and enlarged, is bulkier than ever, and we find by referring to the prices that they are quite up to date, and have in several instances been extended. The memoranda and rules for measuring are useful features, and the present edition is rendered more useful by the insertion of the new Building Rules of the London County Council, in addition to the Metropolitan Building Acts, Regulations of Public Bodies, and Rules on Electric Lighting. The latter subject has been fully treated, and the section on Electric Lighting has been extended. The remarks on sanitary appliances, the Legal Notes and Memoranda, the Marks and Qualities of Wood, and other valuable summaries, make Lockwood's Price Book a most indispensable office-volume to the architect, engineer, builder, and contractor.





It is strongly bound, and, what is equally important, clearly printed, in a good readable type.

◆

CONSTRUCTIONAL DRAWINGS.—I.

Details of an Iron Roof.

EXTRACT FROM SPECIFICATION.

WROUGHT IRON.—The whole of the wrought iron must be of the best double-wrought Staffordshire iron, capable of bearing the following strains:—That for angle and T-irons, 22 tons per square inch; contraction of area at point of fracture, 15 per cent. That for flat, round, or other shaped bars, 23 tons per square inch; contraction of area at point of fracture, 20 per cent. The contractor will have to supply samples of all materials for testing.

Rivets and Bolts.—The rivets and bolts to be made of the best scrap-iron; all bolts and nuts to have strong and clean threads cut upon them of uniform pitch; all heads exposed to be hexagonal.

Cast Ironwork.—The metal for the castings shall be of such a mixture of irons as is best adapted for the purpose, and shall be such that a bar 1in. square and 4½ft. between the supports shall bear, without fracture, not less than 550lb. in the centre. The castings to be made to the pattern and dimensions when cold, as shown on the drawings, and all to be cast smooth, with sharp arrises, and free from air-blows, twists, and flaws of every description. The whole of the ironwork shall be made of the exact dimensions shown on the respective drawings; any ironwork made of less dimensions than those shown on the drawings will be rejected, and any excess of weight caused by the given dimensions having been exceeded will not be allowed for. Before being sent out on to the works, the whole must be carefully erected and fitted together in the maker's yard, and each piece numbered so as to come together again and correspond when being permanently fixed in position.

Swagging, Drifting, and Welding.—All bars, rods, angles, ties, and other iron must work well in the smith's fire at a cherry-red heat, and must bear swagging, drifting, and welding without materially wasting, splitting, cracking, or otherwise showing unsoundness.

Drilling, Punching, Riveting, &c.—All bolt and rivet holes must be accurately marked from templates. All rivet holes to be carefully drilled. All sharp edges round rivet holes to be taken off. The rivets to be of the diameter and pitch shown on drawings, heads and snaps are to be neatly formed to a spherical shape, and should any be cracked or badly made, the rivets to which they belong are to be removed and replaced by others. If any holes should be made in the wrong place, the bar in which such mistake has occurred will be condemned. Plugging will not be allowed in any case.

Forged Work.—All angle and tee-irons, knees, and other forged work must be brought to a proper heat and carefully bent, or worked to the required form, and any bar, angle, tee, or other iron which is overheated, strained, distorted, or discovered in any way unsound or imperfect will be rejected, and must be replaced by a sound one.

Bolts.—Bolts are to be made to Whitworth's standard proportions, with ample length of screwed part.

Joints in Iron Gutters.—The joints in cast-iron gutters must be faced where necessary, and in all cases made with rust or other approved cement to render them perfectly water-tight; spun-yarn or other materials for this purpose must be supplied where required.

Wind Ties.—Wrought-iron wind ties of 1in. round iron are to be provided and fixed as shown; the same to be well bolted to each principal, and to be provided with screw couplings.

Gutters.—The gutters to be of cast iron, ½in. thick, of form shown, to have stiffening flanges well bolted together, and the joints to be well caulked with sal-ammoniac and iron borings; the whole to be left perfectly water-tight.

Painting.—The whole of the ironwork to have four coats of good oxide paint, one coat before fixing, and finished with three other coats of such colours as may be directed.

Notice before Painting.—The ironwork must not be painted over before an examination of it has been made by, or under the orders of, the engineer, who must be apprised in writing when it is ready. All the wrought iron to be well oiled before commencing to build the principals.

◆

The Technical Instruction Committee at Halifax have instructed Messrs. Jackson and Fox, their architects, to obtain tenders for the new buildings, and subscriptions are to be invited towards the cost. The subjects to be taught will include those given at the local Mechanics' Institution, also practical wood-carving, joinery and carpentry, and illustrations of machine-tool making.

A two-light memorial window has recently been placed in St. Paul's Church, Bury, Lancs. St. Peter and St. John healing the lame man at the Beautiful Gate of the Temple is the subject in the first light, and in the second light is the restoring to life, by St. Peter, of Dorcas. The artist is Mr. William Pape, Aire-street, Leeds.

COMPETITIONS.

Chacewater.—The competition for the rebuilding of Chacewater Church, Cornwall, has resulted in the selection of Mr. Edmund Sedding's plans. There were six sets of plans sent in, and various were the suggested methods of treating the hideous building which was erected early in the present century with accommodation for 1,500 persons. The church has for some time been unfit for public worship, and it is intended to commence the work at once.

◆

WATER SUPPLY AND SANITARY MATTERS.

An Immense Intersecting Sewer.—At Brooklyn, N.Y., a mammoth intersecting sewer is on the verge of completion for the purpose of relieving the low-lying districts of the town from the effects of heavy rainfalls. For the new intersecting sewer the claim is advanced of being the third in size yet constructed, the only larger ones being those in Washington and Paris. This at Brooklyn is for 11,400ft. run circular in section, starting with a diameter of 10ft., and 12in. wall thickness, and enlarging successively to a diameter of 12, 14, and 15ft., with 16in. walls. At its outlet the form changes to an approximate rectangle, with an elliptical section to the bottom. The main tunnel has been built by the firm of Messrs. Hart, Anderson, and Co.; the terminal being constructed by Mr. Daniel J. Creene. Mr. Robert Von Baren, city engineer of Brooklyn, designed the work, which has been carried out under the direction of Messrs. L. Russell Clamp and David Stower, assistant city engineers.

King's Norton Rural Sanitary Authority.—On the 5th inst., Colonel Charles Henry Luard, R.E., one of the inspectors of the Local Government Board, held an inquiry at the board-room of the guardians of the King's Norton Union as to an application by the Rural Sanitary Authority for permission to borrow £1,350 for the purpose of extending some of the existing sewers, a work rendered necessary by the increasing population of the district. The plans and estimates, which were prepared by Mr. K. Godfrey, Assoc.M.Inst.C.E., engineer to the authority, were explained by him. There was no opposition, and at the close of the inquiry Colonel Luard visited the different places where the work was to be done.

Cambridge.—The question of the diversion of the sewage of Cambridge from the river has occupied the attention of the local authorities for upwards of a quarter of a century; but at length a complete scheme has been resolved upon. The Cambridge town council adopted some time back a scheme of main drainage upon lines laid down by Mr. J. T. Wood, of Liverpool, but have not hitherto decided as to the disposal of the sewage. Acting upon the advice of Prof. Dewar, the Jacksonian Professor of Natural Experimental Philosophy, they have now resolved on acquiring 67 acres of land adjoining the Milton-road at Chesterton for the purpose of precipitating the solids and utilising and purifying the effluent. The Chesterton sanitary authority are to be invited to join in this scheme, which is a compromise between broad irrigation and a system of precipitation pure and simple. The plan now adopted will cost £20,000, and the main drainage scheme will involve another £98,000, giving a total of about £120,000.

◆

CHIPS.

An illustrated lecture on "David Wilkie" was given on Saturday week in the Glasgow Corporation Art Gallery, Sauchiehall-street, by Mr. Robert Walker, secretary to the Glasgow Institute of Fine Arts.

At a meeting held at Henshaw, near Yeadon, recently, it was decided to form a committee for enlarging the parish church. Plans prepared by Mr. T. H. Healey, architect, of Bradford, were adopted. These provide for reseating the church and adding a chancel, organ-chamber, and vestries, and towards the estimated cost of £1,200 about £650 was promised in the room.

A county police-station is about to be built at Berkhampstead at a cost of about £4,000. Mr. F. Dupont, of Colchester, is the contractor.

Two new elementary schools provided by the School Board for Yardley, near Birmingham, were opened last week, one at Redhill and the other at Greet. The Redhill school will accommodate 500 children, and is to be hereafter enlarged. It has been erected by Mr. Thos. Johnson, of Ashted, from the designs of Messrs. Crouch and Butler, at a cost (including land and fittings) of £5,699. The school at Greet will accommodate 1,000 children, and has cost £10,407; the architect being Mr. Arthur Harrison, and the builders Messrs. Harley and Sons, of Smethwick.

Our Illustrations.

ROYAL ACADEMY GOLD MEDAL GROUP, 1891.—"JACOB WRESTLING WITH THE ANGEL."

This group, which we illustrate to-day, was awarded the Royal Academy Gold Medal and Travelling Studentship, and Mr. Paul Raphael Montford, the artist, is to be congratulated on the success of his work, which represents one of the most familiar incidents recorded in the ancient Scriptures. The picturesque treatment adopted for the wings of the angel seems specially bold and clever.

NEWINGTON PUBLIC LIBRARY.

We give herewith the plan and perspective of the selected design for the new Public Library, Newington, by Mr. Edward I'Anson, M.A.

EASTGATE HOUSE, ROCHESTER.

This house is described in the paper read before the Architectural Association last week, and reported on another page.

"SUGGESTIVE DOMESTIC WORK SEEN ON PAST A.A. EXCURSIONS."

This sheet of sketches of old English houses and the double-page plate representing the ancient timber mansion in the High-street at Rochester, will be found alluded to in our report on p. 257 of Mr. Maurice B. Adams's paper read before the Architectural Association last Friday.

CONSTRUCTIONAL DETAILS.

See description and further sketch on page 236.

CHIPS.

A new Wesleyan chapel is in course of completion at Penryn. The chief façade is of polished granite. Mr. A. Carkeek, of Redruth, is the contractor.

Good progress is being made with the new Craig House Lunatic Asylum at Edinburgh, and it has recently been decided to erect in the grounds as adjuncts to the main buildings six villas to afford greater facilities for curative treatment. The first of the villas has just been completed, and will be occupied next week, but the main buildings will not be completed for two years. Mr. Sydney Mitchell, of Edinburgh, is the architect, and Mr. Lownie the general contractor.

The Dean of Bristol laid on Saturday the foundation stone of a new mission church in Coldharbour-lane, Westbury Park. The building has been designed by Messrs. Crisp and Oatley, of Bristol, and will be of brown Pennant stone, with freestone dressings and red tiled roof. It will provide accommodation for 260 people at a cost of £1,000.

The improved ventilation of the Polytechnic has been intrusted to Messrs. Baird, Thompson, and Co., ventilating engineers, of London and Glasgow.

Two stained-glass windows have recently been erected in the parish church of Kilsaran—the one on the left of the altar in memory of Lady Constance Bellingham, the other in memory of the late priest of the parish, Father Corrigan. Both are from the firm of Messrs. Eardley and Powell, of Dublin. The subject of the former window is the Annunciation of the Blessed Virgin, whilst that of the latter is our Lord exhibiting His Sacred Heart.

The reconstruction of the Leipsic University buildings will necessitate the pulling down of the old library of the Dominican Cloister of St. Paul, which dates from about 1250. This is regrettable, as it contains some fine wall paintings, executed between 1250 and 1515.

A bust of Sir Edward Harland was unveiled on Friday at the offices of the Belfast Harbour Board. The artist is Mr. Bruce Joy.

A new police station has been erected at Walham Green, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Robert Boyle and Son's latest improved patent self-acting air-pump ventilator.

We are informed that the limit of time for receiving applications in the art work branch of the Building Exhibition has been extended to Feb. 27.

A superintendent registrar's office in Liverpool-road has just been completed for the Guardians of Islington from the designs, and under the direction of, Mr. Wm. Smith, of Chancery-lane, W.C. The building is executed in red brick and stone, with a slated roof. Messrs. Brass and Sons were the contractors.

The death is announced, at the age of 62, of Mr. Charles James Lewis, a well-known landscape and *genre* painter in both oil and water colours, and a frequent exhibitor at the Academy.

Building Intelligence.

Leeds.—The London and Midland Bank, Limited, have opened new branch bank premises in Kirkgate, Leeds. The designs are prepared by Mr. William Bakewell, F.R.I.B.A., architect, of Leeds. The façade is executed in stone. The building is two stories in height, Classical in character. The character of the interior of the banking-room is solid. The floor of the bank is laid with mosaic pavement. Mr. Charles Goulden has acted as clerk of works.

Manchester.—New school buildings in connection with the Moss Side Unitarian Free Church, Shrewsbury-street, Brooks's Bar, were opened on Saturday. The building is a two-storied one. The lower portion is occupied by eight classrooms, arranged in two sets on either side of a corridor, the rooms being divided by a series of revolving shutters. There is also a lecture-room. In the upper floor is the large schoolroom, 65ft. by 35ft., providing seating accommodation for 420 persons. The building is of brick, the front being of Ruabon pressed brick and terracotta. The works have been carried out in accordance with designs prepared by Messrs. J. W. and R. F. Beaumont, architects, St. James's-square, by Mr. W. Thorpe, builder, of Cornbrook. The cost of the building and the land is £3,900.

Merevale Church.—This church is about to undergo careful reparation. Plans and estimates have been prepared by Mr. Alfred Bickerdike, architect, of Adam-street, Adelphi, under whose direction the work will be carried out. He was called in to report upon the state of the building eighteen years since, and since that time various repairs have been carried out. Last summer the building showed serious signs of giving way, and had to be temporarily supported, and the present work of repair has become necessary in order to prevent it from falling to ruin.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Architectural Association.—The seventh ordinary meeting for the session was held on Friday evening, Mr. F. T. Baggallay, the president in the chair. Mr. W. J. Langley was elected as a member. Mr. Maurice B. Adams, F.R.I.B.A., read a paper, entitled "Domestic Work seen on past A.A. Excursions," which we report in full on p. 257. The lecture was illustrated by a large number of excellent lantern slides from photographs taken during the excursions by Mr. J. L. Robinson, A.R.H.A., and at the close a hearty vote of thanks was accorded Mr. Adams, on the motion of Mr. H. D. Searles-Wood, seconded by Mr. Arthur W. Earle.

National Association of Master Builders of Great Britain.—This Association held its twenty-eighth half-yearly meeting at the rooms of the Central Association of Master Builders of London on the 26th ult. Mr. J. C. White, of Liverpool, the president, occupied the chair, and representatives from London, Liverpool, Manchester, Birmingham, Bristol, Hull, the Potteries, Cambridge, and Preston were present. The report and accounts for the past half-year were read and adopted. The following officers and council were appointed for the ensuing year:—President, J. C. White, Liverpool; vice-presidents, Robt. Dennett, Nottingham, and John Bowen, Birmingham; hon. vice-presidents, Stanley G. Bird, London, Robt. Neill, jun., Manchester, and J. Howard Colls, London; hon. treasurer, Jos. Stevenson Jones, Liverpool; hon. auditor, C. W. Green, Liverpool. Council:—Birmingham, C. H. Barnsley and W. Sapcote; Bolton, Jos. Hy. Marsden; Bradford, William Moulson and William Holdsworth; Bristol, A. Krauss; Cambridge, A. G. Bell; Derby, John Walker; Edinburgh, Thomas Bonnar; Glasgow, R. Bennett; Hull, R. Beevers; Leeds, C. Tomlinson; Lincoln, Wm. Hy. Close; Liverpool, A. G. White and J. B. Johnson; London, Thos. F. Rider; Manchester, Wm. Southern and Alderman Wm. Brown; Northampton, W. H. Smith; Potteries, Jas. Bowden; Wigan, Chas. B. Holmes; Wolverhampton, J. Bradney. Several matters of interest and importance to the building trades were discussed, and it was decided to hold the next half-yearly meeting at Newcastle-on-Tyne.

Sheffield Society of Architects and Surveyors.—At the monthly meeting held on Tuesday night Mr. Innocent, the president, was in the chair, and Mr. W. Randolph, of Manchester, read an interesting paper on "Town Churches, Ancient and Modern." The lecturer referred to the absence of a matured type of town church in Mediæval England. We had smaller populations and smaller surroundings than our Continental neighbours, and while we multiplied our churches, they rather magnified theirs. On the other hand, our country churches were, as a group, of exceptional excellence. This, together with other considerations, caused them to be adopted 50 years ago as models for the orthodox church of the Gothic Revival. Exceptions in favour of a broader treatment were instanced in the works of Pugin and a few other architects; but no general movement was apparent till about 1850, when both the art and literature of the Revival began to witness to the influence of foreign studies. New ideals in church architecture were opened out; ideals of breadth, mass, freedom, contrivance, expressed in design generally, in the use of materials, and in the character of fittings. Mr. Randolph insisted chiefly on the qualities of breadth and simplicity, and drew special attention to "continuous," "single-naved," and "one-bodied" churches. Some of the best examples of such buildings were to be found in the churches of the Friars, *e.g.*, Ghent, Erfurt, Toulouse, London (Grey Friars), &c., and the last two classes were somewhat generalised in the south of France and in Catalonia. After dealing with the brickwork and church furniture of North Germany and the Netherlands, the lecturer passed on to English precedents. The individual examples of large town churches were referred to; King's College, Cambridge, was classed as "one-bodied"; St. Michael's, Coventry, as "continuous," and it was pointed out that the whole East Anglian district afforded suggestive examples of architectural breadth and beauty. The last portion of the paper was devoted to showing how the character of church work since the middle of the century had been widened under such influences as had been reviewed. Though we had retained much of the breadth of foreign forms at large, we had now happily reverted to a national treatment of individual features and detail generally. Numerous examples illustrative of the different ancient types were instanced in the late church work of London and the provinces. The paper concluded with an allusion to recent church work abroad, instancing, as regarded the revival of the single-span church, the literary efforts of the Rev. Dr. Schneider, of Mainz, and the new churches at Gratz, Rochusberg, and Oostacker.

* * *

Edward Pidcock, builder, Buxton, went home on Monday afternoon, pulled the blinds down, and hanged himself from a bannister. Deceased had been about as usual just before; he was married a year ago, and was about forty years of age.

A lecture was recently given, under the auspices of the Greenock Philosophical Society, to a large audience in the Watt Museum, Greenock, by Professor G. Baldwin Brown, F.R.I.B.A., Edinburgh, on the subject of "The Mediæval Monastery as the Home of Art and Culture." The lecture was illustrated with limelight views.

Dr. Reid, medical officer for the County of Staffordshire, says that slop-water closets are growing in favour for artisans' dwellings. About 13,000 of them are now in use in various parts of the country. They work well, give no trouble, and are not affected by frost.

The seventh annual report of the National Footpaths Preservation Society states that 108 members joined during the past year, the roll now including 859 names. The society has successfully intervened in several cases, notably at Bristol and Pontesbury, and is taking action in others. The society is doing very useful work at an exceptionally small outlay, for the total income for the year was but £277, and the balance in hand has been raised from a few shillings to nearly fourteen guineas. We see that the Bill introduced by Mr. Jesse Collings on Wednesday, entitled "The Preservation of Footpaths," proposes to throw upon the County Councils the duty of protecting public rights of way from every form of encroachment—a much-needed enactment.

WAYSIDE NOTES.

NOTWITHSTANDING the views of the underwriters of Chicago with respect to the effectiveness of ordinary fireproof construction, matters would probably have been different had the destroyed New York hotel been so built. We read that the hotel was of "flimsy and inferior construction." Consequently the disaster was complete. Whatever may be the drawbacks to iron and concrete by reason of the expansion and contraction of girders and joists, and the fracture of columns by heat, such construction at least admits of the escape of the inmates of a building that has caught fire, as it is only old-fashioned wood-floored and wood-staircased houses that are set blazing in every part with the rapidity of tinder. A building with an iron or steel skeleton may not be worth much after a fire, but it admits of the saving of human life, which, after all, is the great point.

One of the last works of the first London County Council will probably be the formation of new by-laws and regulations with respect to theatres and theatre construction. At Tuesday's meeting of the Council discussion on the drafted items of these regulations was resumed, and among other recommendations, was a proposal to submit the matter to the R.I.B.A. and the Surveyors' Institution for their criticism, which, considering the average estimate of the capabilities of the L.C.C., doesn't seem a bad idea. Perhaps an even better idea would be to leave the final decision to the succeeding Council, the present one being on the eve of dissolution. Maybe their successors will have a soul above coveting the management of tramways and waterworks and the wholesale blocking of new metropolitan railway schemes, not to mention the neglect of London improvements and bridge-approaches. Music for the masses and municipal lodging-houses are all excellent in their way; but London and London citizens will not thrive on this alone, be it Belgravia or Bethnal Green, rich man or poor man. It is good to look after the housing of the poor; but I fail to see the wisdom of hindering municipal works and causing stagnation in private enterprises that would create more work for the labouring classes and reduce the number of unemployed.

"Fresh Air's" challenge with respect to the ventilation of churches did not go unanswered, and several letters have appeared in the *Standard* giving the personal experiences of clergymen, doctors, vergers, and others. Mr. H. Holden is trenchant:—"Architects, building committees, clergymen, and ministers are all indifferent." This, of course, is an absurd charge to make. A vicar of a London church says he always sees to the ventilation of his building, but has some little difficulty, "for our verger—a worthy fellow—belonging to a class of persons who keep their cottage windows fast closed for fear of a draught, regards fresh air with keen suspicion." A "Verger of a London Church" says that, of his whole congregation, only two persons ask for fresh air, many of the others complaining if they do not find the church hot and stuffy. Here, I fancy, we have a key to the cause of much of the disagreement about this matter. Opinions about ventilation differ as tastes for meats. What may be pleasant and comfortable to one man, may be the acme of discomfort to another. One may even imagine that some parties like their air a little foul, as some people like their victuals a little "high"! As "A Verger" says, he may be believed to "have enough to do to please all parties."

Nevertheless, this is partially begging the question. There is a suitable temperature for all assemblies. It may not please everyone in the assembly, but it will be the most healthy—by common consent of those who have studied the subject—for the greatest number, and the most comfortable. All people—except any individuals with the eccentric taste to which I have alluded as possibly existing—like fresh air, although they do not like it in the shape of cold draughts. To maintain this temperature and freshness of the air without draught is, therefore, the aim of the "ventilationist." We know well enough that this is not done in every church by a very long way. The discussion that "Fresh Air" has evoked is, therefore, beneficial, and justified if it lead to some slight improvement somewhere, somewhen, and somehow.

The Bishop Suffragan of Peterborough has written a short letter to the *Times* explaining the nature of the restorations, repairs, &c., that will be inaugurated at the grand old cathedral on June 2. Among other things are the fine new marble pavement to the choir, a new pulpit, and new bishop's throne. Further works are, however, immediately contemplated, according to the Bishop of Leicester, and further funds are, as a natural consequence, required. The great west front appears to be the most extensive undertaking in the category of works to be done, and a new marble pavement for the nave and the complete re-glazing of the cathedral are not light matters.

It is stated that the Dean and Chapter of Lichfield have just determined to appeal for an additional £20,000 with which to complete the restorations of their cathedral. An enormous amount of money has been spent on restoration of cathedrals and churches in this country; one may wonder a little where it all comes from. I see it is stated that the sum subscribed for church-building and restoration alone in England in 1890 was £1,698,829—a sum including, however, money for the acquisition of burial grounds, endowed benefices, and building parsonages. Heading the list is the diocese of London, with £211,745. It is pleasing to think that so much money has been forthcoming for a work which, in spirit, is so good. In the flesh, or *stone* rather, the matter, so far as it concerns the restoration of old buildings, takes a different light. We see acres of sleek new masonry, and harsh new mouldings and carvings, in place of beautiful old stonework that might easily have been patched and repaired, as it may have been done time and again at any period within the last five centuries. And not a little addition of new features that falsify the history of the building, though possibly not so much as the workings of the restoration-back-to-a-certain-date mania.

Only a few days ago I was looking at a beautiful old church in Buckinghamshire, and reflecting how it is the very patching and repairing of our forefathers that give us at this day, the picturesqueness of our old churches. Here was a transept end that needed repair. The upper part of the gable appears to have required rebuilding. What did they do? Not pull down the whole feature and rebuild in sleek masonry; but, bricks being apparently ready to hand, and the repairers—having, perchance, in their hearts a conviction that God might be as truly worshipped in a church repaired with a few odd bricks as in one rebuilt with stone, tooled, squared, measured-up, and 5-per-cented—employed the bricks to reinstate the gable, cutting some brickwork to form the coping and simple finial. And, now, the glory of it!

I see no broad-gauge engines or trains on the G.W.R., and fear that they must be at last in truth disappearing, in accordance with the decision of the Board at Paddington. It may be that in a short run on the main line the other day I chanced to miss seeing any rolling-stock of the old type that may yet be running. Anyhow, a few months more will reach the limit ordered for the life of the broad gauge.

The proposed extension of the M. S. and L. R. to London will continue to attract attention, the Bill having been again deposited. Talking to a gentleman much engaged with the iron trade between London and the Midlands, he said that the new line was much needed; but it is to be presumed that his views are not wholly unbiassed. Personally, the need of the railway does not strike me with great force, but on principle I am for any new enterprise, except international tunnels—when you have a "right little, tight little island" of your own, —and "free ferries to Ireland," which I see has just been seriously proposed. The plan of the now contemplated terminus for the new line shows a comparatively small area of ground fronting the Marylebone-road, near Baker-street station, and a large area east of Grove-road and Lisson Grove. The Marylebone Cricket Club appear to have been at last "squared," and the trustees of the Clergy Orphan Schools, it is said, will, under the new arrangements, offer no opposition to the scheme. To endeavour to forecast, I should say that the Bill will go through this session, more especially as the Great Northern Company have withdrawn their opposition. It is probable, therefore, that, wanted or not, the new line will be constructed, and Londoners find themselves with four trunk lines to the North, or five, as doubtless the G.E.R., now running to Doncaster viâ Lincoln, would put in a claim for recognition. GOTH.

CHIPS.

Mr. Charles Turner died on Saturday at his residence, Cumberland-place, Southampton. He was a pupil of the late Sir Isambard K. Brunel, and afterwards practised in Southampton as a civil engineer and architect, but retired many years since.

A vestry, added on to the south-west angle of Wellington parish church, Salop, was opened on Friday. Mr. A. Roper, of Wellington, was the contractor.

Lord Sudeley has signified his intention of rebuilding, at his own cost, the parish church of Tregynon, the parish in which his Montgomeryshire seat is situate. The work will be carried out under the care of his agent, Mr. W. Scott Owen.

Lord Kyllachy, in the Scottish Court of Session, has issued his judgment in the action at the instance of the Steel Company of Scotland against Tancred, Arrol, and Co., the contractors for the construction of the Forth Bridge, in which £50,000 was sued for as damages on account of defenders not having taken all the steel needed in the building of the bridge from them and the Landore Steel Company. The principle upon which defenders' liability was to be determined was recently fixed, and his lordship has fixed the amount payable by them at £24,400.

New Roman Catholic schools on the Town Walls, Shrewsbury, were opened on Tuesday. They adjoin the Catholic Church, and cost £2,600. Mr. Whittingham, of Newport, Salop, was the builder.

Mr. Edward Geflowski is engaged upon a full-length statue of the late Duke of Clarence and Avondale, which will be complete before the opening of the Royal Academy. The Duke is in civilian dress.

Mr. Alfred Arago, the art connoisseur, died in Paris on Thursday night, the 4th inst., at the age of 77. He was the younger son of the astronomer, studied painting under Paul Delaroche, and was appointed Inspector of Fine Arts by Louis Napoleon.

The Glasgow corporation decided at their last meeting to purchase, as from 1st March, the electric-light business, plant, and machinery belonging to Messrs. Muir, Mavor, Coulson, and Co., at the price of £15,000.

We regret to hear that Mr. Conquest, borough surveyor of Folkestone, has had to undergo amputation of the lower portion of the right leg, as a sequel to blood-poisoning following influenza. He is progressing satisfactorily.

Mr. George Taylor, architect and builder, died at Coventry on Sunday week, at the age of 84. A quarter of a century ago Mr. Taylor was one of the principal builders of the city. Among the buildings erected by him was St. Osburg's Church. Mr. Taylor retired from the trade some years ago, taking to farming, but in this pursuit he lost a considerable sum of money. He subsequently returned to Coventry, and resumed his original trade.

Spencer-street Chapel, Leamington, was re-opened after alteration and reseating, carried out at a cost of £3,200. Mr. Victor Scruton, Birmingham, was the architect, and the work has been carried out by John Fell (Limited), Leamington. The works comprise a new school and lecture-hall at the rear of the chapel, the substitution of open pitch-pine seats for the box pews, and the provision of an organ-chamber, new vestries, and committee-room.

In the February issue of the *New Review*, Mr. M. H. Spielmann has an article on "The National Gallery of British Art," in which he discusses the merits of the various sites suggested for the housing of Mr. Henry Tate's collection, and strongly pronounces in favour of utilising for the purpose the space now occupied by St. George's Barracks, at the rear and west of the National Gallery. These barracks involve a constant risk of fire spreading to the National Gallery, and the area would afford the best and most central site for the new gallery. The paper is illustrated by sketch-plans by Mr. H. P. Burke Downing, A.R.I.B.A.

DOMESTIC WORK SEEN ON PAST A.A. EXCURSIONS.*

"Building royally
Their mansions curiously."

AMONG the many practical educational undertakings connected with the Architectural Association, there are few which have proved more successful or more useful than our annual excursions in August. When your secretary asked me to read a paper during the present session, it occurred to me that a retrospective glance giving the opportunity of a comparative review at least of some of the buildings we have seen, would serve to afford timely reminders to those who have joined the excursions, and possibly suggestive ideas to many more who have not before gone over exactly the same ground. I, therefore, with the generous co-operation of my friend, Mr. John L. Robinson, A.R.H.A., the genial and able hon. photographer of the A.A. Excursions, propose to bring before you this evening a selection of buildings, illustrated by some of his photographs, showing a few typical specimens of Domestic work seen on some of our holiday outings. It was the late Mr. G. E. Street, if I remember rightly, who described these excursions of ours as "Architectural Scrambles," an expression which I believe he subsequently saw good reason to modify, although I am not so certain but that, at any rate on some occasions, his words were not actually justified. The founder of these excursions was, as you all know, our very dear friend, the late Mr. Edmund Sharpe, who, with much foresight and zeal for the welfare of the architectural student, conceived the idea of organising systematic trips on the co-operative principle, to different parts of the country for the study and examination of our national architecture. As a pupil of Rickman, and one of the pioneers of the Gothic Revival, he naturally desired to further the progress of that movement by turning the attention of students to some of the more typical examples of Mediæval work, which he had so carefully annotated and analysed in his "Architectural Parallels," and other books. During the six annual excursions, therefore, which he conducted so wisely and so well, the buildings visited were almost exclusively chosen for their Gothic style, and so were chiefly of an ecclesiastical character. The first trip was made in 1870 to Lincoln, Sleaford, and the Spalding neighbourhood; in 1871 Ely, Lynn, and Boston formed the chief centres of the excursion; then the year following, 1872, Stamford, Oundle, Wellingborough, and Northampton. In 1873 Mr. Sharpe took his friends to Grantham, Newark, Southwell, and Lichfield, and in 1874, going over to France for the first time, the A. A. excursion party visited Paris, Soissons, Laon, Rheims, and the surrounding district. The last of the excursions conducted by Mr. Sharpe was the most ambitious trip of all, when he visited, with his friends, the Department of the Charente, to study the Early Gothic domed churches of that district of France. All of you know the memorial volume which was afterwards published, illustrative of the buildings then seen, and those who were so fortunate as to hear Mr. Sharpe's lecture, delivered on June 13, 1876, descriptive of this excursion, are little likely to forget the occasion. The first excursion to Lincoln formed the subject of a most useful book on the architecture of the district, published by Mr. Sharpe at the time. "The Churches of the Nene Valley," issued some years later by Messrs. Kersey and Johnson, illustrated the third excursion. The 1874 excursion to Paris furnished Mr. Sharpe with the text for the celebrated lecture which he gave in Willis's Rooms in 1875. I remember the evening well when Burges and Godwin were there, full of life and fun. Sir Gilbert Scott had two years before delivered his Academy lecture on the use of the Pendentive and Dome in Gothic Architecture† directing the attention of architects in a masterly way to the possible development of these features for new uses in modern monumental buildings. In the central hall of his own design for the Law Courts Scott had endeavoured to realise his aim; but with the exception of Mr. Emerson's design for the cathedral at Liverpool, and some of the South Kensington competitive designs, few other attempts, at any rate in England, have been made on a large scale in this direction, and none of the designs for South Kensington Museum buildings were Gothic in style. Scott, Sharpe, Street, Burges, and Godwin have all passed away, and the old zeal which marked their enthusiasm for the perfecting of the Gothic revival inaugurated by Cottingham, Carter, and Pugin, aided by Rickman, has been allowed to fall short of original intentions, as taste, in these days of restless eclecticism, has taken a turn in favour of the Renaissance. All that is good in this change of fashion undoubtedly derives its origin from the foundations which these honest workers after truth and beauty in design laid down, and if few may now be found who will seriously mourn the departure which we have seen from the cold resuscitation of 13th-century work, or even the enkindled fervour inspired by ecclesiological awakening, we must all, I venture to think, agree that the best of our contemporary work has been very considerably influenced for the better by the grammar of design inculcated by the masters whose names are associated with the hey-day of the Gothic Revival. With this change so marked in the general field of modern architecture, naturally enough has followed a change in the immediate aims of the Architectural Association excursions. Churches at first were chiefly thought of, grand minsters and crumbling monastic buildings; but now, after passing through an intermediate state, with a craving for what was called "Late and Flat," interest is mainly directed towards specimens of Domestic work—Renaissance by preference, and, if possible, with a flavour of that Debased character which has been fancifully designated "twiddle." To witness almost to a man the working bees of the A. A. excursion party, hungry for lunch, but still more eager for food of this mode, mere crumbs of more than "Free Classic," all gathered round in a swarm, sketching and measuring Jacobean monuments, as was witnessed only last August at Acton Burnell, while the ruined Edwardian House, hard by the churchyard, a unique specimen from the hand of the same architect who erected the Bishop's Palace at Wells, was not seen at all by more than half the party, is surely enough to make a purist like Edmund Sharpe turn in his grave. Rightly or wrongly, fashion has changed, and while it will scarcely be denied that contemporary architecture, chiefly civic and domestic, has, speaking as a whole, largely improved in merit, it is certainly obvious that mere "twiddles" do not constitute the backbone of true architecture, any more than the dry bones of archæological formula which the rising architects of to-day affect to so unreservedly despise. More conspicuous effort, of course, is being displayed nowadays than ever before in furthering the education of students intended for the calling of the architect in the future; but is it so certain that in the attractive scheme of the studio forcing-house, a very great risk is not run of dissipating all remaining trace of the traditional side of an architect's work and study, such as distinguished the pupils and followers of a Pugin, a Scott, a Street, and a Burges? Are we not tending to reduce our students to an average dead level? I fancy the Institute prize drawings this year were an evidence of this being so. In old time, when the finest works the world has ever seen were built, it was tradition alone which guided designers and craftsmen in their work. Now, as then, there must be some leading principles, some definite aims, some semblance at least of a unity of ideas, if good and living work is really to be secured. To waste valuable energies over the fruitless squabble so recently carried on as to whether architecture be an art or a profession seems a matter for much regret when so many practical matters need attention. Architects worthy of the name must plan and build houses structurally sound, well lighted, and conveniently arranged before ever they can deserve the credit which some seem so anxious to secure of being called high-art architects. To erect a crumbling ruin, a house without foundations, a disintegrated structure posing as an ancient building, is not even good construction, and deserves nothing but the stoutest condemnation whoever may be guilty of like things; and such as these are by no means unheard-of circumstances even nowadays, to the bad name and discredit of architects with the public be it said. During our excursions it has often been remarked that the more modern the work the less the merit discoverable in the example. This, however, is only half the truth. Bad design, bad construction, and bad planning can be found, of course, in all periods; but whether the work be old or whether it be new, it is generally certain that its badness will be correspondingly found associated with pretentiousness and the marked absence of simplicity. Old, well-worn word-saw as this is, we can never realise the fact too often. Above all things, an architect has to deal with facts, and his success must be measured by the manner in which he deals with them. Looking back over many annual excursions with members of the Architectural Association, these trite remarks suggest themselves as being among the most apposite by way of introduction. With respect to the excursions themselves, as at present conducted they seem to be admirably suited for those who have for so many years constituted the bulk of the excursion party; but it is to be noted that this is so because we have grown older and more experienced, more readily able to catch the main distinguishing features or peculiarities of a building when visiting it than formerly. For the junior student and young beginner these outings are scarcely so adapted, and if some such guide as our own founder, Mr. Sharpe, could be discovered who would start a second personally-conducted excursion for the younger men, it no doubt would more nearly realise the original aim and prove a great advantage. My first excursion was in 1876, when the A. A. went to Winchester, and I have attended each year ever since. It was on this occasion that our late President, the late Mr. C. R. Pink, first acted as assistant secretary, and the subsequent success of the yearly outings which followed were due to his care and unselfish industry on our behalf. Warwick, in 1877, followed, with my old friend, the late Mr. Bowes A. Paice, as President, and all the older men among our ranks remember the work he carried out as Hon. Sec. of the A. A. In 1878 we went to Hull, visiting Beverley, Selby, Howden, and other fine Yorkshire churches. Next year, 1879, we visited Wells, Shepton Mallet, Glastonbury, and neighbourhood. This, perhaps, was the queen of all our excursions, and here the late Mr. J. D. Sedding first joined our party. In 1880 we went to Norwich, an event of some importance to the A. A., as on this occasion Mr. John L. Robinson first brought his camera with us. Since then he has never missed coming. In 1881 Mr. Aston Webb conducted the excursionists to Worcester, on which trip we saw some of the best Domestic work we have ever seen, and all who were there well remember the breakfast with the late Lord Beauchamp at Madresfield Court. Next year we went to Mr. J. A. Gotch's headquarters, Kettering, and his intimate knowledge of the buildings of his county made the Rutland and Northamptonshire excursion one of the most profitable yet enjoyed. At Yeovil, in 1883, we had a jolly time, the weather was grand, and the work was admirable. Bury St. Edmund's, the headquarters of the Suffolk excursion in 1884, under our good friend, Mr. Cole Adams, came next, when we had great fun, and saw some splendid churches and good brick mansions. In 1885 our first Oxfordshire excursion took place, starting from Banbury as the centre of a very rich district, and including a visit to such famous places as Compton Wynyate, in Warwickshire; Canons' Ashby, the seat of grand old Sir Henry Dryden; and Broughton Castle, with its gate-house, church, and mansion. The Red Lion hotel, at Banbury, too, placed hospitality of no mean character on record. Malling, in Kent, in 1886, was a failure in this latter aspect; but Maidstone would not undertake our accommodation. Mr. James Fowler, of Louth, ever ready in days gone by to describe buildings for the party, this year conducted the excursionists over Rochester Castle and Cathedral, after which, Restoration House and the old timber mansion in the High-street were seen. At Maidstone, Mr. J. D. Sedding distinguished himself in explaining the Founder's Tomb, and other features of interest, in the great parish church. At Bath, in 1887, Sedding was last with us, and we put up at the Pump House hotel. The landlord remarked, at parting, that "architects were excessively good fellows, but they were blessed with exceedingly good appetites." The qualification really employed by "mine host" was even more expressive than polite. The Derbyshire excursion, when we saw Haddon, Hardwick, and Bolsover, was held in 1888, with Matlock Bath as headquarters. This excursion was Pink's last. In 1889 we went to King's Lynn, and saw some of the most beautiful and big churches to be seen in the county of Norfolk. Oxford in 1890 occupied our attention, with as rich a programme as need be, not forgetting Burford, Ewelme, and Water Eaton. Last year we visited Shrewsbury, and saw Ludlow, Stokesay, Pitchford Hall, Plaish Hall, also Moreton Corbet, and Condover. Such, in brief terms, is an outline of the districts seen during the past sixteen years. Mr. Searles-Wood has contributed in no small degree to the continued success of these outings, acting continually as excursion hon. secretary, and if there is another name which should deservedly be mentioned, it is that of our hon. quartermaster, Mr. Charles Wellard, without whose whistle and catering care we should often have fared worse and not gone so far. The difficulty immediately presenting itself at the outset of such a task as that before us is the amount of material to be dealt with. To reduce this to something like order, it may be well to broadly classify the buildings under notice in the following groups, regardless of style, date, and locality — viz., "Half-Timbered Houses," "Stone Houses," "Brick Houses," "Plaster-Fronted Houses," "Garden Walls and Details," "Interiors," and "Furniture." The most notable specimens in the half-timbered method of building will at once strike you as being Pitchford Hall, Shropshire; Mere Hall, Worcester; Somershall Herbert, Derbyshire; the Market House, Ledbury; Salwarpe Hall, Worcestershire; Ford's Hospital, Coventry; Leicester's Hospital, Warwick; Huddington Court, Worcestershire; the Courtyard, Ightham Mote, Kent; Ewelme Almshouses, Oxfordshire; Severn End, Worcestershire; Stokesay Castle Gatehouse; and several old buildings in Shrewsbury, Worcester, Tewkesbury, Stratford-on-Avon, Warwick, and Kent. Only a few remain with their timbers not grimed up with black pitch or tar. In some the work, as at Mere Hall, is largely sham, with designs for timber framings coloured over plaster and brick surfaces.

---

† Building News, March 21, 1873.

(*To be continued.*)

NOTES ON BUILDING PRICES.—XXII.

By John Leaning.

SLATER (*continued*).

Slate Damp-proof Courses.—For these the very cheapest slates are used, and consequently the smallest—i.e., 12in. × 6in. These may be bought for 35s. per thousand of 1,200 delivered—say 40s.; i.e., about 1d. per foot superficial, and almost every fragment would be used. The calculation would be as follows:—

Two thicknesses of slate at 1d.	2d
2½ per cent. waste on slates for cutting	0⅛
Cement $\frac{1}{27}$ bushel at 1s. 9d.	0¾
Bricklayer and labourer ·008 at 12s. 3½d. (Mixing cement and labour and laying.)	1
Cost per foot superficial	4

Ridges.—Of slate ridges, Thomas's patent is the best, and costs per foot run net at warehouse:—

	s.	d.
1¾in. roll, 5in. wings	1	10
2in. roll, 5¼ wings	2	0
2¼in. roll, 5¾ wings	2	3
2½in. roll, 6in. wings	2	7

If cut to lengths, ½d. per foot more.

Taking the first price as an illustration.

	s.	d.
1ft. of ridge	1	10
Carriage	0	0½
Incidental cuttings	0	0½
Cement, $\frac{1}{20}$ bushel at 1s. 9d.	0	1¼
Bricklayer and labourer ·005 at 12s. 3½d.	0	0¾
Oil cement for roll	0	0½
Per foot run	2	1½

Merchant's Prices.—The preceding calculations will suffice to show that, except by putting himself in the exact postion of the slate merchant—i.e., regularly employing slaters, buying his slates at the quarry in large quantities, or quarrying them himself, and conveying them by sea, the average builder cannot get the work done at anything like the price at which the slate merchant does it, and the reason for subletting to him is irresistible.

The fashion of specifying Countesses 20in. by 10in. tends to keep up their price as compared with other sizes; often as much as 2s. per square may be saved by adopting another size when the 20in by 10in. slate is scarce.

The current prices charged by the merchants for slating, laid complete, are as follows:—

	£	s.	d.
16in. by 10in. Bangor, laid to 2½in. lap, with two 1¼in. copper nails to each slate, per square	1	2	6
20in. by 10in. ditto	1	5	6
20in. by 12in. ditto	1	5	6
24in. by 12in. ditto	1	7	6
20in. by 10in. Portmadoc ditto	1	3	6
For the steep parts of Mansard or curb roofs, add per square	0	0	9
If zinc nails instead of copper, deduct per square	0	1	0
If slating is laid to a 3in. lap instead of 2½in., add per square	0	1	2
For Eureka slating add 40 per cent.			

Final Repair.—The cost of final repair will depend upon the quality of the management. Much damage is done by leaving plumbing too late, neglect to remove scaffolding after it should have been removed, and preventible carelessness of the men.

The Slater's bill of an estimate should contain a clause—"Allow for cleaning out gutters, and for leaving roofs perfect and weatherproof at completion of works." The value of the item is usually guessed at—its cost varies with each building. Like other items of its kind, the only way to arrive at a reasonable generalisation would be to keep the account of time and materials in a number of instances, and it is difficult to induce foremen to do so.

With care, 6d. for each square of ordinary slating like Countesses, will cover the cost; on more expensive slating the amount should be increased in proportion to the price per square, and it may be observed that slates are more likely to be broken than tiles.

A few instances of its estimation by different men are as follows:—

		per square s.	d.	£	s.	d.
10	squares of slating, Countess	3	0	1	10	0
40	,, ,, ,,	0	6	1	0	0
14	,, Eureka green	1	5	1	0	0
41	,, tiling	0	6	1	0	0
23	,, ,,	0	4¼	0	10	0
86	,, ,,	0	2¼	1	0	0

Slate Masonry.—The work of the slate mason is almost always sub-let by the builder. Lavatory tops, with their skirtings, shelves, urinal slabs, and cisterns, are always ordered complete and ready for fixing of the merchants, and the builder fixes.

As the grooving, rubbing, sanding, drilling, &c., are all done by machinery, and can in no other way be so cheaply done, the usual practice of the estimator is to send an extract from the bill of quantities to the merchant, and obtain a special estimate.

In the case of slabs, the price is quoted in the trade lists in two categories: one for slabs as they come in the merchant's stock, and another cut to size. The price is regulated not only by the thickness, but by the width and length. There is also a difference in price between self-faced splitting slate slabs, and slate slabs planed two faces edges from saw.

The current London net prices for slab at merchant's yard are as follows, and the table shows the distinctions of size which are observed:—

Planed Two Faces, Edges from Saw—Measured Net.

	¾in.	1in.	1¼in	1½in.	2in.	2½in	3in.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
From 3ft. to 5ft. long and 1ft. to 2ft. 6in. wide	0 10	0 11	1 1½	1 3	1 8	2 3	2 10
From 5ft. to 7ft. long and 1ft. to 3ft. 6in. wide	1 0	1 1	1 3½	1 6	2 0	2 5	3 0
From 7ft. to 9ft. long and 1ft. to 4ft. wide	—	1 3	1 5½	1 8	2 2½	2 7	3 2
From 9ft. to 10ft. long and 1ft. to 5ft. wide	—	—	1 7½	1 10½	2 4½	2 9	3 5½

Slabs cut to angular shapes are measured by the extreme dimensions either way.

Self-faced splitting slabs sawn to size are about 10 per cent. less than the foregoing.

The current London net prices for labours by the merchant are as follows:—

	s. d	s. d.	s. d.	s. d.			
Rubbed edges	0 2	0 2¼	0 2½	0 2¾	—	—	—
Rounded edges	0 2¼	0 2¾	0 3¼	0 3¾	—	—	—
Groove or rebate, per 1in. girth	0 2	—	—	—	—	—	—
Rounded corners to 1in.	0 4	—	—	—	—	—	—
Ditto to 1½in.	0 5	—	—	—	—	—	—
Rounded corners with rounded edges, 1in.	0 6	—	—	—	—	—	—
Ditto 1½in.	0 7	—	—	—	—	—	—

Moulded Edges.—

½in. and ¾in.	1in.	1½in.	2in.
4d.	5d.	6d.	8d. per foot run.

Holes drilled or countersunk for screws, per dozen:

	s.	d.
Depth of hole ½in.	0	1
,, ,, ¾in.	0	1
,, ,, 1in.	0	1½
,, ,, 1¼in.	0	1¾
,, ,, 1½in.	0	2
,, ,, 2in.	0	2½
,, ,, 3in.	0	4
Holes for basins in 1¼in.	2	6
,, ,, 1½in.	3	0

Sawn Slate Cisterns.—Where special shapes are not important, including delivery within usual limit, including galvanised iron bolts, and fixing complete, hoisting and tackle by purchaser.

			£	s.	d.
50 gallons	1in.	thick	2	0	6
80 ,,	1in.	,,	2	12	6
100 ,,	1in.	,,	2	17	6
120 ,,	1¼in.	,,	3	6	0
150 ,,	1¼in.	,,	3	18	0
175 ,,	1½in.	,,	4	16	0
200 ,,	1½in.	,,	5	8	0
250 ,,	1½in.	,,	6	2	6
275 ,,	1½in.	,,	6	7	6
300 ,,	1½in.	,,	6	15	0
350 ,,	1½in.	,,	7	7	6
400 ,,	1¾in.	,,	9	0	0
450 ,,	2in.	,,	11	5	0
500 ,,	2in.	,,	12	10	0

Cisterns requiring slabs over 7ft. long, or 2ft. 6in. wide, or containing less than 20 gallons, are a higher rate. When cisterns are made to specified sizes, they are charged by the foot superficial, and the following is the rate complete, and in all respects as last described.

	s.	d.
¾in. per foot super	1	5¾
1in. ,, ,,	1	7
1¼in. ,, ,,	1	9¼
1½in. ,, ,,	1	11½
1¾in. ,, ,,	2	3
2in. ,, ,,	2	8½
2½in. ,, ,,	2	11½
3in. ,, ,,	3	4

Enamelled Slate.—Long lists of the varieties of enamelling, and which are comparatively useless, will be found in the price books; it is questionable whether anyone who understands the subject ever refers to them. If enamelled chimney-pieces, or enamelled slabs, are required, the architect selects them from a manufacturer's stock, or gets a special estimate. The surveyor, in dealing with them, requires the production of the invoice. The independent valuation of any ornate enamelling is only possible to a valuer possessing technical knowledge beyond the average.

The current price for plain enamelling is 11½d. per foot supl. enamelling, plain edges.

½in.	¾in.	1in.	1¼in.	1½in.	2in.	3in.
2¾d.	3¼d.	3¾d.	4¼d.	5½d.	6¾d.	8¾d. per ft. run.

TILER.

The roofing tiles used in London are brought from Reading, Maidenhead, Bracknell, Broseley, or Ruabon, and the estimator's price per square usually includes the lathing. In their measurement the same system of allowing superficial quantity for labour and waste obtains as in slater's work.

The current prices are as follows for three localities, which will afford reasonable parallels to any of the districts from which London is supplied.

Lawrence's:—	Per thousand. s.	d.	Weight per thousand.
Red	34	6	1 ton
Rich dark red	36	6	1 ton
Strawberry colour, extra	1	6	—
Stained brown, extra	3	6	—
Fancy tiles (shaped ends)	38	6	1 ton
Hip, Valley, and plain-angle tiles	185	0	1 ton

In trucks at Bracknell.

Railway rate to Vauxhall, 3s. 8d. ton.

The foregoing holed only, nibs extra.

Broseley Tiles.—A trade discount of 5 per cent. deducted.

Pressed plain roofing tiles	33	3	.. 1 ton
Fancy tiles (as before)........	35	8	.. 1 ton
Gable tiles ("tile and half")..	66	6	.. 1½ ton
Eaves tiles (7in. by 6½in.)	33	3	.. ¾ ton
Hip tiles	257	3	.. 33¼cwt.
Valley tiles	257	3	.. 33¼cwt.
Angle tiles, plain	257	3	.. 33¼cwt.
Angle tiles, ornamental	257	3	.. 33¼cwt.

In trucks at nearest railway station.
Railway rate to Paddington, Brentford, or Chelsea basin, 7s. 11d. ton in 4-ton lots.

The foregoing holed or nibbed at same rates. They generally have both, so that if the nib is broken off, which frequently happens, the tile may be nailed.

Ruabon Tiles.	Per thousand. s.	d.	Weight per thousand.
Red, brown, or brindled....	35	0	...... 1 ton
Fancy tiles (as before)	37	6	...... 18 cwt.
Tile and half	70	0	...... 1½ ton
Eaves tile	35	0	...... 18 cwt.
Valley tiles	257	3	...... 1½ ton
Hip tiles..................	291	8	...... 1½ ton

In trucks at nearest station to works.

In 4-ton lots, 9s. 6d. per ton. In 2-ton lots, 25s. per ton.

If any of the foregoing are prepared with holes instead of nibs, add 2s. 6d. per thousand.

If blue instead of red, add 5s. per thousand.

	d.
Tiler, per hour	9
Labourer	5¾

Quantity required per square.—The tables as to the number of tiles required to cover a square vary considerably, and rarely state whether they express the calculated quantity or include an allowance for waste. The number may be computed in the same manner as directed for slates. The general size is 10½in. by 6½in., and ½in. to ⅝in. thick. The *calculated* quantity per square is as follows. They are most frequently laid with a 3½in. lap:—

4in. gauge	2½in. lap	554 tiles
3½in. ,, ...	3½in. ,, ...	633 ,,
3in. ,, ...	4½in. ,, ...	739 ,,

Tile Lathing.—Judging from published tables, considerable uncertainty exists as to the best size of laths for plain tiling. Some say 1¼in. by ¼in., others 1in. by ¼in. For good work they are never specified less than ¾in. thick; 1¼in. by 1in. is a reasonable size. Their size should always be specified.

They are imported ready sawn in various sizes—generally ¾in. by 1¼in., ¾in. by 1in., ¾in. by 2in., and are sold at the timber sales by the 144ft. run, or they may be bought at the sawmills, where common stuff is frequently converted into laths for tiles or slates, and sold at per hundred feet run. Anything beyond ¾in. thick would be obtained from the mills.

Common prices in quantity are as follows:—

	At timber sales—	At sawmills.
¾in. × 1¼in.	0s. 6d. per 144ft. ..	0s. 8d. per 100ft.
¾in. × 1in.	0s. 5d. ,, ,, ..	0s. 7d. ,, ,,
¾in. × 2in.	1s. 4d. ,, ,, ..	1s. 6d. ,, ,,

1¼in. by 1in. at sawmills would cost 9d. per 100ft.

	Nails.
The calculated number of feet run of lath and number of nails for 4in. gauge is 300ft.......	255
Ditto ditto for 3½in. gauge is 340ft.	289
Ditto ditto for 3in. gauge is 400ft.......	340

The gauge of the lath being the same as that of the tiles in 10ft. of roof slope, we should have for 4in. gauge 30 lines of lath, and 30 + 10ft. = 300ft.

With rafters 14in. from centre to centre we have 8½ by 30, the number of crossings which gives 255 nails to a 4in. gauge.

Five per cent. on laths and nails will cover the waste.

The constant for laying tiling with a 3½in. lap (3½in. gauge) is ·700 of bricklayer and labourer. Labourer unloading or loading per thousand ·010.

The constant may be modified for the different gauges by a calculation in simple proportion, as recommended for slating.

Two and a half per cent. will cover the waste, exclusive of cutting otherwise allowed for. The value of a square of Broseley tiling 3½in. gauge, laid down with nibs in London, would be calculated as follows:—

A labourer should keep three tilers supplied with material.

	s.	d.	
Broseley tiles in trucks	33	3	per thousand.
Railway rate	7	11	,,
Loading carts ·010, unloading carts ·010 = ·020 labourer at 4s. 9½d.	0	11½	,,
Cartage, say	4	6	,,
	46	7½	

	£	s.	d.
633 + 16 = 649 tiles at 46s. 7½d.	1	10	3½
·700 of bricklayer at 7s. 6d.	0	5	3
·233 of labourer at 4s. 9½d.	0	1	1½
357ft. 1¼in. by 1in. sawn for laths, 9d. carriage 2d. = 11d. per 100ft.	0	3	3¼
304 = $1\frac{1}{16}$lb. 1½in. cut clasp nails (sixpenny), 3½lb. per thousand, at 12s. cwt.	0	0	1½
Carpenter fixing per square ·40 at 7s. 6d.	0	3	0
	£2	3	0¾

Extra on Common Tiling for Tile and a Half to Verges is measured by the lineal foot. The plain tiles are 10½in. by 6½in.; the tile and half 10½in. by 9¾in. The extra-sized tile is used for the alternate courses only. The price per thousand is about twice that of the common tiles. The extra trouble of changing from common tiles to tile and half and fitting to verge (no cutting required) is extra labour, ·008 day of tiler.

The cost of Broseley tile and half is as follows:—

	£	s.	d.
1,000 at works	3	6	6
Railway rate on 1½ ton at 7s. 11d.......		11	10½
Cartage and delivery as before—1½ ton at 11½d.		1	5¼
	3	19	9¾

Adopting as an example a 4in. gauge, to half the lineal quantity measured tile and half is substituted for the common tiling; we have, therefore, to each lineal foot 6in. by 9¾in. = 5in. superficial of extra value. Then—

	£	s.	d.	£	s.	d.
568 Broseley tile and half at £3 19s. 10d. per thousand..				2	5	4
568 common tiles at £2 6s. 8d. per thousand	1	6	6			
Add one-half	0	13	3	1	19	9
Difference on 1½ squares				0	5	7

Two-thirds of the above difference, 3s. 8½d., represents the difference of value per square.

The value per foot-run would, therefore, be—

	£	s.	d.
$\frac{5}{12}$ths of a foot super. extra value of tiles at 3s. 9d. per square	0	0	0¾
Extra labour laying and fitting to verge, ·008 day bricklayer at 7s. 6d.	0	0	0¾
Per foot-run......................	0	0	1½

Extra on Common Tiling for purpose-made Hip and Valley Tiles to course and bond with General Tiling and allow for Cutting and Waste is an item, as it frequently appears in a bill of quantities, and is better measured thus than in two items—*i.e.*, extra for hip and valley tiles and the cutting put into the superficial measurement of the tiling. The difference between the amount of cutting to a valley or hip where lead is used and another where purpose-made tiles are adopted is considerable—in the former case, all the tiles must be cut to a raking line; in the latter, the cutting is only to be discovered by close scrutiny, and there is much less waste, because it is at a right angle with the ridge instead of raking. Hips and valleys are generally measured and billed together, although the mean length of gauge of which they take the place is not the same for hip as valley. The average may be taken as 10in. wide, and 1½in. on each edge would more than cover the waste. The width affected would, therefore, be 13in. in all, equal to the width of two tiles, and for a 4in. gauge, three courses to the foot run. Three hip or valley tiles would consequently take the place of six common ones. The difference of value of the tiles to each lineal foot would, therefore, be as follows:—

	£	s.	d.
The cost of Broseley hip and valley tiles, per thousand	12	17	3
Railway rate on 1½ ton at 7s. 11d.	0	11	10½
Cartage and delivery, 1½ ton at 11½d. ..	0	1	5¼
	13	10	6¾

	£	s.	d.
Cost of three hip or valley tiles at £13 10s. 7d. per thousand............	0	0	9¾
Deduct cost of six plain tiles at £2 6s. 8d. per thousand	0	0	3¼
Difference in value of tiles per foot run	0	0	6½

	£	s.	d.
Extra cost of tiles per foot run	0	0	6½
Extra labour—laying, fitting, and cutting, ·020 day of bricklayer at 7s. 6d.	0	0	1¾
Extra cost per foot run	0	0	8¼

Pegs and Pins.—When tiles have holes instead of nibs, they are secured with wooden or cast-iron pegs. The latter are best, and should be about 2in. long. One thousand weighs 25lb., and costs at the rate of 9s. 6d. per cwt., and if galvanised, 18s. cwt. The cost of these may be readily computed by allowing two for each tile. Wooden pegs cost about 1s. 9d. per bushel, and a square requires about a peck.

If tiles are bedded in lime and hair, the extra cost would be calculated as follows:—

	s.	d.
$\frac{2}{27}$ of a cubic yard of lime and hair at 15s. 6d. (see Torching, section Slater)	1	1¾
Labour, per square: bricklayer ·150 at 7s. 6d.	1	1½
,, ,, labourer ·050 at 4s. 9½d.	0	2¾
Extra cost per square..........	2	6

Tile Ridges.—Of tile ridges the prices and patterns are various. They may be selected by number from a trade list, and such a list will generally give the weight and the railway rate per ton for carriage. They are generally made in 12in. lengths.

If we take as an illustration Lawrence's No. 7, of which about 150 weigh a ton—

	£	s.	d.
Say 150 tiles at 6s. per dozen	3	15	0
Railway carriage, 1 ton at 3s. 8d per ton	0	3	8
Unloading, carting, and delivery at building, say..........................	0	5	0
150ft.)	4	3	8
Per foot	0	0	6¾
Cement, 1-20th bushel at 1s. 9d.	0	0	1¼
Bricklayer and labourer, ·006 at 12s. 3½d.	0	0	1
Cost per foot run	0	0	9

Oak Shingles.—Oak shingles are generally about 12in. long, and 3in. to 4½in. wide, and are laid to the same gauge as tiles; about 1,000 are commonly reckoned for a square, and the cost, delivered within three or four miles, is 8s. per hundred.

The laying may be taken as equal to the smallest slates or tiles of the same gauge.

The value of the cutting would vary with the angle. Assuming the size of a shingle to be 12in. by 4in., the calculation for the number required to cover a square to a 4in. gauge would be 4in. by 4in. = 16 exposed surface; 100ft. by 144in ÷ 16 = 900; 2½ per cent. will cover waste by damage = 23. There would be, therefore, 923 shingles and 1,800 + 90 nails. The calculation for the value of a square would be as follows:—

	£	s.	d.
923 shingles at 8s. per hundred	3	13	10
1890. 1¼in. copper nails, $9\frac{9}{10}$lb. at 9¼d...	0	7	7½
·700 carpenter at 7s. 6d.	0	5	3
·233 labourer at 4s. 9½d.	0	1	1½
Cost per square	4	7	10

For the double course to eaves the under shingle would be about 5in. long; say, half a shingle = 1½ shingle per foot run, and three nails = 5¾d., extra labour less than ¼d. = 6d.

The price per square having been computed, the cost for raking cutting may be obtained from it. A width of 3in. to each cut edge of the finished work would pay for the waste. Extra labour. Day of carpenter ·010 consequently.

	£	s.	d.
¼ft. at 87s. 10d. per square	0	0	2¾
·010 carpenter at 7s. 6d.	0	0	1
Cost per foot run	0	0	3¾

* * *

A new reredos of carved oak has been placed in the parish church of Yarcombe, near Honiton, as a memorial. It is to a great extent a replica of the reredos at St. Saviour's church, Torre, Torquay, designed by Mr. Medley Fulford (of the firm of Messrs. Fulford, Tait, and Harvey, architects, of Exeter), and made by Mr. Harry Hems, of Exeter, some years ago, and the same artists have been engaged in the present work. The groups are restricted to three figures in each panel. The central one is devoted to Our Lord's death, the Blessed Virgin, and St. John. In one of the other panels is Joseph of Arimathea, the Roman Centurion, and Nicodemus, and on the other side the Three Maries.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—G. W. and Co.—M. H. N.—Jas. Alderson.—Cestrian.—F. P. (Winchester).—J. W. H. Co.

Correspondence.

PATENT SCHOOL PLANS.

To the Editor of the Building News.

Sir,—I was much interested in the plans for the improvement of schools illustrated in your last issue, patented by Mr. T. Hughes, and as the subject of education generally is at present to the fore, I should be obliged if you could spare a little space for a few questions and remarks upon them, as the plans given are so microscopic, unfortunately, that many necessary details are omitted altogether, or are undecipherable. From the description given, the classrooms are 40ft. by 20ft., which appears to be an odd size and proportion for seating and supervision. As they are shut off from the central hall, general supervision also seems difficult by the head teacher; and if the school were designed for erection under the Education Department, the rules in many ways are lost sight of, and probably some difficulty would be experienced in obtaining sanction for it. In the matter of building, the great amount of outside walling would add much to the expense, and, too, their great extent would be a means of loss of heat. The deep and narrow recesses between the end classrooms would surely be objectionable.

Cloak - rooms that open directly out of a schoolroom or hall are not desirable either; they would be much better shut off, and properly warmed and ventilated.

In closing, I beg to assure Mr. Hughes that these few remarks are made in a friendly spirit, and with a few of further ventilation of a subject well worth consideration. And if more details could be supplied, a better understanding of the ideas put forth would result.

From my own experience it appears to be a wise thing to do to protect fresh notions, as there are numerous persons who appreciate any new and practical ideas, and make use of them in their own work, without scruple or recognition.—I am, &c.,

Anthony R. F. Trew, M.S.A.

Broad-street, Bristol.

MIDLAND TRUANTS' SCHOOL, LICHFIELD.

Sir,—In last Friday's issue of the Building News there is an announcement to the effect that the plans bearing motto "Adaptability and Economy" have been accepted by the Committee, and that Mr. E. R. Robson was the assessor.

This statement is calculated to convey the impression that these plans were placed first by the assessor, whereas such was not the case.

The designs bearing motto "Supervision" were placed first in order of merit by the assessor, but were set aside by the Committee for some reason of their own, and the former substituted.—I am, &c.,

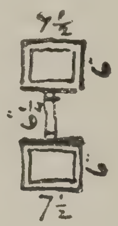
Richard James Rowe.

(Author of Designs Bearing Motto "Supervision.")
54, Broad street, Bilston, Staffs.

Intercommunication.

QUESTIONS.

[10714.]—**Safe Load.**—An old subscriber will be obliged if any of your correspondents will say what safe load (say 1-10th of breaking weight), a cast-iron pier—thus, will support? The two pillars are united at top, bottom, and centre, by a flange 4in. broad. The thickness of metal in the pillars ¾in., and the height 13ft., both ends flat, and carefully bedded.—No Name.



[10715.]—**Technical Schools.**—In what part of London can I see some good technical schools lately built?—Scot.

[10716.]—**Asphalte Floor.**—I propose laying floor for machinery, composed of 4½in. concrete bottom, and finished with 1½in. crushed black rockstone asphalte. Any information regarding proportions, and laying of above to make sound floor, will oblige.—A. B. C.

[10717.]—**Architect and Building Committee.**—When a building committee demands copies of quantities of all trades, is an architect bound to let them have same? If not, a few reasons against delivering same will oblige, as they state they cannot tell whether the extras and deductions in the contractor's accounts are correct without them, the architect having made out the statements.—Disgusted.

[10718.]—**Marble Floors.**—I shall be greatly obliged if some fellow correspondent will kindly inform me what is the best material to use in laying marble floors in churches—proportions, mode of laying, and thickness?—J. H.

[10719.]—**Salisbury Cathedral.**—Having obtained no reply to my questions on the above, given in the issue of Dec. 4, I beg to bring it again under notice, and should feel greatly favoured if anyone would give me the information. I find also, on p. 349 of Rosengarten's text-book, that the great eastern window of the above cathedral is said to be 35ft. broad, by 85ft. high! Surely this must be a mistake, as I don't remember seeing any large east window; besides, the Lady-chapel is only, I suppose, about 40ft. in height, and the nave and choir a little over 80ft. above the pavement. In Prof. T. Roger Smith's handbook on Gothic and Renaissance, p. 7, a section through the nave is given, with scale adjoining, but I don't know of any section through the nave which would only show a single aisle. Besides, if measured to scale, it represents more nearly the great transept; but then the windows don't correspond, if I remember properly. Any information on the above will oblige.—David F. Smith, Maidstone.

REPLIES.

[10703.]—**Concrete for Artisans' Dwellings.**—Breeze from gasworks makes a tough concrete and an excellent material for nailing wood thereto, but it is very far from being the strongest aggregate for self-supporting floors. It is too small in size (much of it being more suitable for making cement mortar than concrete), too uniform in texture, and possesses very little inherent strength. These combined render it incapable of withstanding the high compressive and tensile strains which large self-supporting slabs of concrete are subject to. It is used only for moderate spans, and then chiefly because it comes to hand ready for use, and can be had in towns oftentimes for nothing. Floors of 12ft. span, or even more, have been made with success; but in a general way 10ft. is better, and, all points considered, as profitable as any. Iron or steel girders have, as a necessity, to be employed when the span is greater than 10ft. or 12ft. Breeze is not a good material for walls, and of all the aggregates in use for that purpose, it is, perhaps, the worst. The back volumes of the Building News contain much information with regard to concrete floors, and, as may be supposed, it is a subject on which a good deal has been, and may be still, written.—Thomas Potter, Alresford.

[10703.]—**Concrete for Artisans' Dwellings.**—The coke-breeze concrete should be formed with four parts of coke-breeze to one of Portland cement, and should be well mixed in a dry state, and then water gradually added till the mixture is quite sloppy. This is necessary, because the coke absorbs a great quantity of water. Before the coke-breeze concrete is laid, strips of wood, ¾in. by 2in., should be placed on edge at intervals of 6ft. or 8ft., to form screeds for obtaining a level surface. I have not laid slabs of coke-breeze concrete in sand on the brick-rubbish concrete. This might be advantageous, if the time was short for laying floor. The slabs (and also coke-breeze bricks for fixing joiner's work), should be made under cover during frost. It does not matter how fine the coke-breeze is.—C. F. M.

[10711.]—**Wooden Houses.**—I have just returned from a trip to the States, where I looked into the question of house "raising" a little, and if "G." will write me definitely what it is he requires, I may be able to help him.—Surveyor, 1, Camden-road, Carshalton.

[10712.]—**Swimming Baths.**—Why not white glazed bricks as ordinarily? Water in volume in a white bath will look coloured according to its purity or otherwise. In London baths, those in a district supplied with less pure water have a green tint; where a harder and purer water is supplied, it appears of a blue-grey. See (when open in the season) the large swimming-ponds at Goulston-square, Whitechapel, and at St. George's Baths, Pimlico, which I call to mind as having appeared to me of a tint that "Architect's Pupil" may consider "transparent sea-green." Any attempt to give effect with tinted skylights will be a failure. First ascertain the nature of the water, and, it may be, there will be quite enough green, even with white bottom and sides. Most London bath superintendents think there is a deal too much, and will express themselves pretty strongly on the point.—R. O. D.

CHIPS.

In the House of Commons on Tuesday, notices were given of the introduction of Bills by Mr. Knowles for the registration of plumbers; by Lord Henry Bruce, to provide improved cottages for labourers; and by Mr. T. H. Bolton, to amend the Conveyancing Acts with regard to leaseholds.

Mr. Charles Waldstein has received a concession from the Greek Government for the American School of Classical Studies at Athens to excavate Sparta, with Amyclæ and any other site in the whole of Laconia, for seven years. It is proposed to make a beginning at Sparta next month.

The proposed new regulations affecting theatres and music-halls were further discussed at Tuesday's meeting of the London County Council, when it was explained that they would apply only to buildings to be constructed in the future. An attempt was made to postpone the consideration of the question in order that the proposals might be discussed by the Surveyors' Institute and the Royal Institute of British Architects; but the regulations were ultimately passed.

On Wednesday week Mr. W. Wilkinson, R.P.C., chief sanitary inspector for the borough of Derby, delivered a lecture entitled "Details of Plumbers' Work," at the Mechanics' Institute. The lecture was the fifth of the course of thirteen which are being delivered, under the auspices of the Sanitary Institute and the Derbyshire County Council, for the benefit of the sanitary inspectors, surveyors, and others employed in the county. The chair was occupied by Mr. W. Iliffe, medical officer for the borough of Derby.

According to the Parliamentary estimate, prepared by Mr. A. R. Binnie, the engineer to the London County Council, the cost of constructing the proposed extension tramway across Westminster Bridge and along the Thames Embankment to the South Eastern Railway Bridge, is only expected to be £9,616, including contingencies. Mr. Binnie gives the average cost of preparing the roadway for the lines, and reinstating the surface, at 104s. per lineal yard.

At an extraordinary meeting of the shareholders in the Eiffel Tower for Blackpool, held on Monday, it was decided to carry out a modified scheme, only the tower and the central portion of the buildings to be erected at present, the Aquarium and the Beach Hotel being left standing. It was reported that the foundations are being excavated by a firm of Manchester contractors, and that the contract for the tower had been let to Messrs. Heenan and Froude, of Manchester, at £42,000.

Colonel R. W. Edis, F.S.A., has prepared for the entire restoration of that part of Sandringham House which was recently destroyed and damaged by fire. In addition to this, several new rooms will be constructed. The work has already been begun by a local builder.

Mr. Aston Webb's plans have been approved for building a shallow north transept and porch in the place of the blacksmith's forge, which has so long disfigured the old priory church of St. Bartholomew-the-Great, West Smithfield; and plans for dealing with the west front and vestry-room have also been approved. "The Ladye Chapel" will afterwards be taken in hand.

Legal.

FINAL CERTIFICATES.

If persons agree to do something upon a certificate being given, they are not liable, in the absence of fraud, until it is given. This general rule has been repeatedly laid down in Courts of law upon questions arising under building contracts; and it was again enforced by the Master of the Rolls in the recent peculiar and important case of "De Morgan, Snell, and Co. v. Rio de Janeiro Flour Mills Company (Limited)" (*Times*, 3rd Feb.) in the Court of Appeal. There the contract was to build mills and granaries at Rio de Janeiro for the company, subject to the supervision of a resident local engineer, and the final approval of a chief engineer, who was to give his certificate on completion. While the works were in progress the resident engineer objected to certain bricks; thereon the contractor appealed to the chief engineer in London, who passed them, and so overruled his subordinate. This caused some months' delay, and when the works were completed the chief engineer refused to give his final certificate because disputes were pending, which were referred to arbitration. The arbitrator found that the company were liable to the contractor for the delay caused by their resident engineer, and that they were also liable for depreciation in certain Argentine securities in which a retention fund had been invested, because the chief engineer has caused delay by his refusal to give his final certificate when the works were completed.

A Divisional Court had declared the arbitrator to be wrong in both these views, holding that the company were not liable for the mistakes of their resident engineer, nor in any way responsible for the fall in the securities. The Court of Appeal affirmed their decision, pointing out emphatically the legal position of the engineers, in language equally applicable, of course, to architects acting under similar contracts. The resident engineer had to approve or disapprove of the work. He had no judicial office. Upon his refusal to pass materials, the contractors had to get others. That was their contract, and the contractors had no power of appeal to the chief engineer, so the delay they caused in so doing was their own fault. The resident engineer had acted honestly, and the company were in no way liable for his actions, they not having interfered with his course under the contract. In the same way the company were not responsible because the chief engineer refused his certificate. The parties to the contract made this certificate a condition precedent to payment. Until that certificate was given the contractors had no claim, and so the arbitrator was totally wrong in making the company liable for compensation, or for the fall in the securities caused by delay arising from the conduct of the resident and chief engineers named in the contract.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning, to insure answer same week.

L. L.—Contract.—Death.—The executors of the deceased builder can and should complete the contract he had begun; and, indeed, they are bound to do so in such a case as this, as it is not a matter of personal skill, as in the case of an architect. The executors should go on with it, especially because it will be to the benefit of the estate they have to administer.

Builder.—Extras.—Progress Certificates.—You should not have done these extras without the written advice of the architect, as provided by the contract; and you cannot recover for them unless you can show a subsequent ratification of some kind. His progress certificates do not affect the question, or relieve you from the clause as to written orders, even though they include work not expressly within the contract.

◆

The Commission appointed to report upon the question of restoring to Hampton Court Palace the Raphael cartoons, which were removed to South Kensington Museum in 1865, has, after much deliberation, and the examination of six eminent specialists upon the subject, arrived at the conclusion that the cartoons shall remain in their present position at South Kensington, subject to certain alterations being carried out, with a view to render the gallery in which they are exhibited more effectively fireproof.

Our Office Table.

An inquest was held on Tuesday at St. George's Hospital, Hyde Park-corner, as to the death of Charles Evans, aged 22 years, an architect, lately residing at 18, Kensington Court-place, who committed suicide on Friday morning last, after a terrible struggle with a fellow-lodger. Deceased, who had been a member of the Architectural Association since 1888, shared a bedroom with Mr. Herbert Campbell Moore, and became delirious on Friday morning when recovering from influenza. After a struggle with his friend he jumped from the window in a nude condition, sustaining fatal injuries. The jury returned a verdict of "Suicide during temporary insanity."

The qualities which are found to preserve timber from wet rot, density and resinousness, are those which have to be increased if possible in any attempts to promote the preservation of timbers. The great durability of oak, pitch-pine, and Jarrah is attributable to these qualities. The fixed oils fill the pores and render the wood dense. Oil-barrel staves are very lasting. According to one authority, pitch, or dead oil possesses advantages over all known substances for the protection of wood against changes of humidity. A colonial journal quotes Professor Letheby's opinion that dead oil first coagulates albuminous substances; second, absorbs and appropriates the oxygen in the pores and so protects from decay; third, resinifies in the pores of the wood, and shuts out both air and moisture; and fourth, acts as a poison to lower forms of animal and vegetable life, and so protects the wood from all parasites. These properties specially fit pitch oil for impregnating timber exposed to alternations of wet and dry states. Dead oil is distilled from coal-tar: its antisepic quality resides in the creosote it contains.

A deputation representative of the home and foreign timber trade of the United Kingdom waited on the President of the Board of Trade on Tuesday with reference to the new railway rates on timber, one of the main requirements being that all foreign and balk timber should be carried at computed measurement weight only. Sir Michael Hicks Beach, in reply, pointed out that the subject had been very thoroughly threshed out in the recent inquiry before Lord Balfour of Burleigh and Mr. Courtenay Boyle, and by the joint-committee of both Houses; in addition to which, in the subsequent progress of the Bills in Parliament, he had assented to several amendments brought forward on behalf of the trade. If they were not satisfied with the decision arrived at by Parliament last Session, their course would be to frame amendments to the Bills that were coming before Parliament this Session, and petition Parliament and be thoroughly represented before the Commissioners to whom those Bills would be referred.

CHIPS.

At Carpenters' Hall, London-wall, on Wednesday evening, Sir Douglas Galton, K.C.B., gave an address on "Ventilation, Warming, and Lighting."

In the matter of the application for discharge by Peter Balmer, of Aughton, near Ormskirk, architect, the discharge has been suspended for one calendar month, which ended on the 8th inst.

The local board of Hoylake and West Kirby, near Liverpool, decided on Monday to advertise for plans for public offices to be built in three sections, at a cost not to exceed £3,000.

The Annual Convention of the American Association of Master Builders was held in Cleveland, Ohio, on Monday, Tuesday, and Wednesday, the 25th, 26th, and 27th ult. The attendance was large. Mr. McAllister, of Cleveland, the President of the Association, in his brilliant address, took for his theme the unsatisfactory character of those building contracts which put the contractor entirely at the mercy of the architect. The remaining time was occupied by the hearing and consideration of committee reports, and election of officers, and by various excursions and entertainments.

At a meeting, on Wednesday, of the members of the Royal Scottish Academy, held in Edinburgh, Mr. James Guthrie, Mr. J. C. Noble, and Mr. J. Denovan Adam were elected Academicians, to fill the vacancies caused by the death of Sir William Fettes Douglas, Sir John Steell, and Mr. J. Dick Peddie, F.R.I.B.A.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Clerks of Works' Association. Annual Dinner, Holborn Restaurant. 6.30 p.m.
Surveyors' Institution. "An Explanation of the London Water Question," by J. W. Grover, C.E. 8 p.m.
Society of Arts. "The Development of Electrical Distribution," Cantor Lecture No. 2, by Professor George Forbes, F.R.S. 8 p.m.

Tuesday.—Society of Arts. "The Forthcoming Exhibition at Kimberley," by Lewis Atkinson. 8 p.m.
Institution of Civil Engineers. Discussion on "Gold Quartz Reduction Machinery." 8 p m.
Glasgow Architectural Association. Annual supper.

Wednesday.—Civil and Mechanical Engineers' Society. "Gas Producers," by R. Booth. 7 p m.
St. Paul's Ecclesiological Society. "Religious Subjects on Misericordes," by T. A. Martin. 7.30 p.m.
Society of Arts. "The Pamirs," by Capt. F. E. Younghusband. 8 p.m.

Friday.—Architectural Association. "Domestic Electric Lighting," by Max Clarke. 7.30 p.m.
Royal Institution. "Micro-Organisms," by Professor P. F. Frankland, F.R.S. 9 p.m.

◆

The Examinations of the Royal Institute of British Architects.—Notice is hereby given that, after the close of the year 1893, all gentlemen who desire to qualify for Candidature as ASSOCIATE of the Royal Institute of British Architects (except in special cases submitted to and approved by the Council) will be required to enter for the PRELIMINARY Examination, and having passed it, work up through the INTERMEDIATE to the FINAL Examination, which in 1894 will take the place of the present "Examination in Architecture." The only examinations to which young Architects who are in practice, and who desire to become Associates without passing the Progressive Examinations, can enter, take place twice in the year 1892 and twice in the year 1893. Those, therefore, who may not be prepared to enter for the "EXAMINATION IN ARCHITECTURE," before the close of 1893, should take immediate steps to secure registration as Probationers, which they can do by passing the Preliminary Examination or obtaining the grant of exemption therefrom

ASTON WEBB, Hon. Secretary.
WILLIAM H. WHITE, Secretary.

The Royal Institute of British Architects, 9, Conduit-street, Hanover-square, London, W , 25th January, 1892.

Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Brighton.—For repairs, &c., to No. 68, Lansdowne-place, Hove, Brighton, for the Misses Harbord. Mr. Walter J. Ebbetts, F R.I.B.A., Savoy House, 115, Strand, W.C., architect:—

Baylis, H., London	£160	0	0
Elliott, W. and A., Brighton ...	140	0	0

Chelsfield.—For rebuilding shop, house, and premises after fire, at Pratt's Bottom, Chelsfield, Kent, for Mr. G. Osgood. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, architect and surveyor:—

Knight, T., Sidcup	£979	0	0
Wood, F., Chislehurst	963	0	0
Lowe, R. A., Chislehurst	953	0	0
Owen, W., Farnborough (accepted)	798	10	0

Chichester.—For new Congregational church, schools, &c., Chichester, Sussex. Mr. E. J. Hamilton, architect, Brighton. Quantities by the architect:—

Stevens, Bastow, and Co., Bristol	£3,400	0	0
Holloway, Bros., Battersea, S.W.	3,138	0	0
Curtis, W. H. C., Poole	3,107	0	0
Burrell, A., Littlehampton ...	3,100	0	0
Wallis, W., Balham	2,794	0	0
Light, W. R. and C., Portsmouth	2,757	0	0
Holt, J. O., Chichester	2,730	0	0
Snewin, Bros., Littlehampton ...	2,687	0	0
Croad, J., Portsea	2,670	0	0
Hall, T. P., Southsea	2,658	0	0
Potter, J., Horsham	2,545	0	0
Budden, J. C., Chichester* ...	2,535	0	0
Peters, P., Horsham	2,460	0	0
Stallard, G., Havant	2,450	0	0
Jones, A, Selsey	2,350	0	0
Stephens, F., East Grinstead ...	2,329	0	0
Winslade, W., Selsey-on-Sea ...	2,120	15	0

*Accepted, subject to a reduction for omission.

Clevedon, Somerset.—For the erection of a ladies' cloak-room on the beach, for the local board of health. Mr. S. W. Knowles, surveyor:—

Green, W. A.	£221	0	0
Lee, J.	207	16	0
Hill, Thos. (accepted)	190	0	0

Eastbourne.—For the erection of institute in Old Town, Eastbourne, in memory of the late Canon Pitman. Mr. Herbert Spurrell, F.R.I.B.A., architect:—

Harding	£2,295	0	0
Peerless	2,159	0	0
Noakes...	2,136	0	0
Backhurst	2,132	0	0
Hart	2,095	0	0
Miller and Selmes	2,078	0	0
Martin, M.	2,050	0	0
Cornwell	1,990	0	0
Martin, J.	1,957	0	0
Dennis, C. P....	1,880	0	0
Stanbridge and Tupper	1,752	0	0
Coster, J. (accepted)	1,575	0	0

All of Eastbourne.

Hackney.—For the erection of school-buildings, water-closets, playgrounds, boundary-walls and gates, school-keepers' house, &c., at Gayhurst-road, in the Hackney Division, for the School Board for London. Mr. T. J. Bailey, architect to the Board. Quantities by Mr. Henry Lovegrove:—

Mowlem, J., and Co.	£17,850	0	0
Boyce, T.	17,750	0	0
Williams, C., and Son	17,094	0	0
Hart Bros.	16,876	0	0
Lawrence, E., and Sons	16,346	0	0
Cox, C.	16,266	0	0
Killby and Gayford	15,936	0	0
Dabbs, W. M. (accepted)... ...	15,697	0	0

Hampstead.—For repairs, &c., to No. 1, Rosslyn-gardens, Belsize-lane, Hampstead, for Messrs. Clarke and Calkin. Mr. Walter J. Ebbetts, F.R.I.B.A., Savoy House, 115, Strand, W.C., architect:—

Yerbury, R. A....	£270	0	0
Manktelow and Co.	227	0	0
Baylis, H.	185	0	0
Steel, W....	168	0	0

Haverstock Hill.—For additions and alterations to the Orphan Working School, Haverstock-hill, N.W. Mr. Charles Bell, architect. Quantities by Mr. Henry Lovegrove:—

Clarke and Bracey	£4,383	0	0
Holliday and Greenwood	4,139	0	0
Burford and Sons	3 886	0	0
Wall, C.	3 647	0	0
Wallas	3,589	0	0
Allen and Sons	3,550	0	0
Bryan and Sons (accepted) ...	3,508	0	0

Heywood, Lancs.—For constructing slipper and vapour baths as additions to the public swimming baths for the town council:—

Fowles, Heywood (accepted).

Leek.—For two houses at Wall Grange, for Mr. W. Challinor. Messrs. W. Sugden and Son, architects:—

Knowles, W., & Stubbs, J. (accepted)	£415	13	0

Leek.—For Alsop Memorial Gateway at the Cottage Hospital. Messrs. W. Sugden and Son, architects:—

Grace, T. (accepted)	£61	4	0

Leyton.—For constructing teachers' rooms and other alterations to the Harrow-green schools, for the Leyton School Board. Messrs. J. T. Newman and Jacques, 2, Fen-court, E.C., architects to the board:—

Wood	£423	0	0
Reed	413	0	0
Scott	397	0	0
Catley	380	0	0
Gregar	368	0	0
Coxhead	349	0	0
Holland (accepted)	344	0	0

Liverpool.—For the construction of two hydraulic engines for use in (A) the Vyrnwy subway beneath the Manchester Ship Canal, and (B) in the aqueduct tunnel beneath the Mersey, for the County Council. Mr. S. F. Deacon, engineer:—

Easton and Anderson, Whitehall-place, S.W. (accepted), (A) £876 0 0; (B) £945 0 0.

Liverpool.—For alterations and repairs to properties in Ennerdale, Roscoe, and Back Bridewell-streets, for the City Council:—

Crosbie, J. and T. (accepted)... ...	£150	0	0

London.—For the erection of warehouse in rear of No. 6, Upper Thames-street, E.C., for Messrs. Hilton, Anderson, and Co. Messrs. Hudson and Booth, architects. Quantities by Mr. Henry Lovegrove:—

Rider, T., and Son	£1,698	0	0
Lawrence, E., and Son	1,647	0	0
Hall, Beddall, and Co.	1,620	0	0
Scrivener, W., and Co.	1,619	0	0
Nightingale, B. E.	1,525	0	0
Greenwood, J.	1,499	0	0

London.—For alterations and repairs to 152, Fleet-street, E.C., for Mr. S. Alderton. Mr. Walter J. Ebbetts, F.R.I.B.A., Savoy House, 115, Strand, W.C., architect:—

		Extra.
Drew and Cadman	£930	£98
Spreckley, C....	922	52
Smith, W.	798	47

Newport, Isle of Wight.—For the erection of an engine-house at the waterworks, for the town council:—

Barton Bros.	£375	0	0
Jenkins, T. (accepted)	348	0	0

Notting-Hill.—For alterations and additions to Nos. 9 and 10, Norland-terrace, Uxbridge-road, Notting-hill, W., for Messrs. Hunt, Mills, and Co. Mr. C. L. Tudor, 81, Lancaster-road, Notting Hill, W., architect:—

Watts, Notting Hill	£1,088	14	7
Colley, Notting Hill	797	0	0
Cowley and Drake, Lisson-grove ...	758	0	0
Nash, Kensington	749	0	0
Tozer, Notting Hill	709	0	0
Moody, Folkestone (accepted) ...	630	0	0

Rugeley.—For the preliminary boring for water-supply at Stoney-brook, Fair Oaks, for the local board. Mr. W. H. Radford, engineer:—

Isler, C., and Co., London (accepted).

Orpington.—For the erection of a shop and house and three cottages at the Chislehurst-road, Orpington, Kent, for Mr. James Cox. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, architect and surveyor:—

Owen, W., Farnborough	£938	0	0
Wood, F., Chislehurst	865	0	0
Stebbings, C., Sidcup	845	0	0
Knight, T., Sidcup	815	0	0
Somerford and Son, Clapham and Orpington (accepted)	697	0	0

Orpington.—For additions and alterations to the Wellington-road school, Orpington, Kent, for the Orpington School Board. Mr. St. Pierre Harris, 1, Basinghall-street, E.C., and Orpington, architect and surveyor. Quantities by Messrs. C. Stanger and Son:—

Lowe, R. A.	£2,683	0	0
Grubb	2,673	0	0
Laurence and Son	2,625	0	0
Staines and Son	2,598	0	0
Smith and Son	2,579	0	0
White and Son	2,565	4	0
Wallis, W.	2,536	13	0
Duthoit	2,535	0	0
Holt and Son	2,492	0	0
Stebbings	2,481	0	0
Mid Kent Building Co.	2,352	0	0
Graty	2,339	0	0
Rick	2,248	0	0
Martin and Co.	2,229	0	0
Somerford and Son	2,216	0	0

Orpington.—For Poor-Law Schools, Orpington, Kent. Mr. Fred A. Walters, F.S.A., 4, Great Queen-street, Westminster, architect. Quantities by Mr. John B. Lofting, 4, Great Queen-street, S.W.:—

Stimpson and Co., London ...	£14,450	0	0
Holloway Bros., London	14,019	0	0
Patman & Fotheringham, London	13,975	0	0
Silver and Sons, Maidenhead ...	13,768	0	0
Smith, W., London	13,675	0	0
Bottrill and Sons, Reading ...	13,600	0	0
Sanders, H. J., Southampton ...	13,385	0	0
Higgs, F. and H., Loughborough Junction	13,360	0	0
Smith, J., and Sons, S. Norwood	13,095	0	0
Longley, J., and Co., Crawley, Sussex	12,925	0	0
Gregory, T., and Co., Clapham Junction	12,797	0	0

Radstock, Somerset.—For the completion of the play-ground, latrines, and drains at the board schools now partially built:—

Bird (accepted)	£200	0	0
For school desks and furniture:—			
Illingworth and Co., Leeds (accepted)	85	6	0

[Lowest of five tenders received.]

Shirley, Hants.—For paving the footway between Fourposts-hill and Waterloo-road, for the Shirley and Freemantle local board of health. Mr. H. J. Weston, surveyor:—

Preedy, J., Southampton	£110	0	0
Roe, J. W., and Co., Southampton*	97	17	0

*Accepted.

Stafford.—For the supply and erection of new purifiers at the gasworks, for the town council:—

Walker, C. and W., Donnington (accepted) £1,723.
(Lowest tender of 14 received.)

Stafford.—For columns, girders, and joists at the new purifying-house at the gasworks, for the town council:—

Walker, C. and W., Donnington (accepted) £1,160.
(Twenty-one tenders received, of which this was the lowest.)

Stafford.—For steel girders and curved plates for new retort-house floor at the gasworks, for the town council:—

Ocean Ironworks Co., Manchester* ...	£251	10	0

* Accepted.

Stafford.—For the conversion of the loggia and porch at the public baths into lock-up shops for the town council:—

Chatfield and Wrench (accepted) ...	£84	10	0

West Ham.—For alteration and additions to the Hallsville Schools, Canning Town, for the West Ham School Board. Messrs. J. T. Newman and Jacques, 2, Fen-court, E.C., architects to the board:—

Maddison	£3,381	0	0
Hearle and Farrow	3,246	0	0
Sharpe (accepted)	2,060	0	0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXII.—No. 1937.

FRIDAY, FEBRUARY 19, 1892

DANGEROUS STRUCTURES.

IT is absurd to imagine that the term "dangerous structure" is applicable only to those buildings which come under the cognisance of local authorities or the London County Council, for we have many overwhelming facts to prove that there are structures which contain the elements of danger within their four walls which no statutory provision can touch. The records of failure and disaster to buildings alone in London during the last few years are sufficient to convince anyone that inherent weaknesses are possible to exist in buildings for years unsuspected, and all at once, from a very trivial or slight cause, to exhibit dangerous symptoms, or cause immediate collapse. No law, however stringent, can guarantee the construction of stable buildings, as the limits of its operation are confined to a superficial inspection of certain points, and those only of matters that admit of examination in a perfunctory sort of way. However comprehensive the by-laws, or vigilant the district surveyor, a great many things may pass or escape his notice. Defective bond, inferior mortar, shaky timber, flaw in iron, bad foundation, are points that would likely elude the most circumspect officer who would pay particular attention to those matters which are scheduled and are visible.

If we examine the causes which make buildings dangerous—that is unstable, we find one to be age and neglect. Thousands of houses and buildings in the Metropolis have suffered from the vicissitudes of time and neglect. The natural decay of stone and brick and timbers have reduced their strength; repairs have not been made at proper intervals, and the structure passes into that state of senility and decay, which makes it difficult to do anything but rebuild. Bad construction is another cause that requires often radical or remedial measures to be taken, and which the Building By-laws are primarily intended to prevent; but beyond these causes of danger, there are two or three others which elude inspectors and district surveyors. The most important of these may be placed under the head of Disturbance. There is scarcely any building of size in the Metropolis that is not exposed to disturbing causes of one sort or another. Perhaps the most frequent kind of disturbance is that due to excavations near the foundations, underpinning operations of adjoining premises, new drains, &c. These works are undertaken often without careful supervision by adjoining owners, and the danger is not found out till it is too late to do anything except to remedy the mischief or to make compensation. The rights of building and adjoining owners, as laid down in the Metropolitan Building Act, cap. 122, section 83, are not invariably carried out, though a building owner has a right to make good or repair any party structure out of repair, or to pull it down and rebuild it if so defective as to be dangerous. Then we find disturbance by the removal of walls of support by the demolition of adjacent property. Numerous buildings in London are seriously impaired by the removal of adjacent property, but the damage done is not always detected, nor is there any by-law which controls the pulling-down of premises. Vibration is a source of danger, as was found to be the case in the formation of the underground railway tunnels and their recent extensions eastward. Many premises showed signs of settlement, and we know heavy compensations had to be paid. In the case of the Mersey Tunnel Railway, many tradesmen of Birkenhead brought actions for injuries to their premises. A clause of the Act provided for full compensation to owners of property. A large hotel was found to be in a dangerous condition, owing to subsidence; but it is needless to cite cases. The Land Clauses Consolidation Act makes it compulsory for promoters of new works to compensate for such injuries.

There is a further cause of mischief arising from the inherent defects of buildings which escape the surveyor's attention. Amongst these defects we may mention a weak or yielding foundation, such as that which caused the subsidence of the Yarmouth Town Hall, or running sand. Defects or flaws in iron girders, which have caused the collapse of many recent buildings, are beyond ordinary control. Then we have, lately, the example of a large block of business premises at Battersea, which, through a recent fire, caused the death of two girls, still a subject of inquiry. The evidence at least shows that many inherent defects in the old buildings existed, and that it is quite possible for a bressummer or beam insufficiently supported to cause the total collapse of a building in case of a fire breaking out. These are a few of the conditions which make buildings dangerous, and which may exist undetected by those appointed under local authorities.

In the new clauses of the London Building Law Consolidation Bill now under consideration, several necessary amendments have been made. The expression "structure" is made to include "any building, wall, or other structure, and anything affixed to or projecting from any building, wall, or other structure." But more is wanted to bring buildings under the designation of "dangerous and neglected structures," which is the amended heading of Part III. of the Consolidation Bill. Sect. 64 says, "Where it is made known to the County Council that any structure is in a dangerous state, the Council shall require a survey of such structure to be made by the district surveyor, &c," and he is to make known any information which he may receive, &c. But how can information reach the County Council or the surveyor that will give them any clue as to the foundations, the sufficiency of support to bressummers, flaws in girders, and other defects that are concealed from view.

Numerous defects and dangers will exist and remain undiscovered unless the Building Act renders them impossible. What, for example, is there to prevent a weak bressummer being put up, or one with inadequate support? The proposed amendments are in the right direction; but what is wanted are definite rules, such, for example, that every beam or girder is to be tested to carry a certain load before a competent inspector, that every bressummer has sufficient bearing at each end, and intermediate story-posts or stanchions; that these under no pretence can be removed for extensions or alterations without a certificate from the County Council; that a staircase should be provided to a certain area of floor, and be constructed within brick or fire-resisting walls; that matchboarded partitions and ceilings should be disallowed on business premises, that houses should not be united into one, except under particular conditions of structure being complied with, that chimney-breasts should in no case be cut away without a careful examination of the wall, and other support be given to it. The evidence given of the Battersea and other recent cases is instructive in this matter, and proves the inadequacy of the existing law to discover latent defects of construction, and to provide for the stability or safety of buildings in certain emergencies.

OTHER METHODS OF REMOVING SNOW FROM TOWN STREETS.

A PRACTICABLE method of removing snow from town streets by melting it *in situ* was given in the BUILDING NEWS, January 15; but other methods have been proposed at various times, some of which have been patented, but not yet, as far as we know, brought into use. One of these was that of Pownall, for a method of removal by means of steam or hot air in a close chamber. For this purpose a steam-tight vessel of iron was to be mounted on a carriage to facilitate its removal from place to place. The vessel was to be divided into two or more compartments, the object being that while the process of conversion was proceeding in one the others were being filled with snow. Each of the compartments was to have a perforated lining, with a space between the lining and the sides of the vessel, so that the steam or hot-air might circulate on all sides; or, if found more suitable, pipes for discharging the steam or hot air upon the snow might be employed. Each chamber was to have a steam-tight door or lid, through which the snow was to be filled, capable of being readily secured, so that when shut a tight joint was made all round. A valve at the bottom was provided for the discharge of the water. A steam boiler or hot-air apparatus, capable of generating a sufficient supply, was to have a force-pump and necessary fittings, which were to be mounted on the same carriage as the snow chamber; or these might be on a separate carriage with connections between them for the passage of steam.

In the same year Crane devised improvements for speedily and effectually removing snow from streets by means of a small steam-boiler, mounted on a carriage drawn by one or two horses, for the production of steam at a pressure of 40lb. per square inch, the boiler to be provided with pipes or hose to convey the steam, and apply it as follows:—A gang of men to be employed to bring the snow from distant parts on each side of one of the sewer openings, a perforated iron shield being placed over the opening to keep the snow from actual contact with the grating. The pipe or hose from the boiler was to be inserted beneath the shield, and the steam was made to play upon the snow as fast as it could be conveyed and piled upon the shield. When only one boiler was employed it was to be removed from one opening to another, and the process repeated. In lieu of the shield a trough or hopper could be used, which, though more cumbrous, would more rapidly dispose of the snow, as a large quantity would be acted upon and the waste steam reduced. It was calculated that by this process, with 40lb. steam, and a pipe 1in. diameter, from 15 to 20 tons of snow could be disposed of per hour.

The apparatus of John Farrend Clarke, gas engineer, of Moorgate-street, was to be worked by a blast of air being driven through a tube which was inclosed in another tube containing gas, the air and gas passing on together to a nozzle, where after the mixture of the air and gas, a flame was produced. The other end of the gas tube was connected with the gas main of the street, or with a street lamp service pipe. The tubes were to be flexible, or might be of metal if required. The nozzle, of brass or other metal, was composed of an inner and an outer tube connected to the inner and outer tubes above referred to. When the gas supply was turned on and ignited a strong blast of air was forced through the inner tube by means of a fan or of bellows, the nozzle being directed to any point in the manner of a fire-engine hose, by means of which ice or snow could be quickly melted. The inner or air tube was made a little shorter than the outer or gas tube, so that the air in its passage should produce a draught in the gas tube. Instead of using a nozzle, the gas and air tubes might be made to terminate in a chamber within another chamber, from which double tubes or nozzles might radiate in a fan-like manner.

In the year 1868, Bayley, of Newington-causeway, made improvements in carts and other vehicles for the removal of snow from streets and for melting it and disposing of the water, which consisted of a wrought-iron tank, mounted on wheels, say four in number, with shafts or a pole fitted thereto. At the top of the cart, and constituting the whole of its upper surface except a seat for the driver, was a hopper or receptacle for the snow as it was shovelled up from the streets. The hopper was divided into two parts—an upper and a lower part—by a sieve or perforated metal plate, to prevent the entrance of stones and other solid refuse into the lower chamber. The hinder end of the hopper projected somewhat over the tank, so as to allow the furnace to be placed under the projecting end, and thereby give its heat directly thereto. The heat was applied to the lower chamber of the hopper by means of serpentine flues from the furnace placed in the lower chamber, and having interstices into which the melted snow could enter, so as to utilise the heat to the fullest extent. The passage of the water into the tank was accomplished by means of a large pipe with its mouth projecting into the upper chamber of the hopper, and covered with strong wire gauze. As the snow is fed into the hopper it comes in contact with the sieve, which is itself in contact with the upper surface of the flues, and melts and fills up the lower chamber, and as much of the upper chamber as reaches to the level of the tank pipe. The lower part of the snow is thus always in warm water, and gradually melts and supplies the tank.

It is a feature of both this invention and the next to be mentionened that they are combined with means of watering the roads. In the same year, but later, in which the above-named project was made public, Mr. Sims, of Glasgow, a contractor for public works, proposed to water streets from fixed pipes laid along the edge of the footpath on one, or in some cases both sides of the street, perforated with holes through which, when the water is turned on, jets of water issue with force enough to carry them either half way across or completely across the street. One of the streets of Glasgow—Buchanan-street—was provided with these pipes, and Mr. Sims found that holes of about $\frac{1}{16}$in. diam. and 12in. apart answer very well. It is better to have pipes on both sides, watering to the middle of the street only, as that leaves half the width clear for traffic while the other is being watered. These pipes along the side of the roadway are connected at intervals with the street mains, the watering was then done in sections of the length of the street. Where such a system was adopted for the street watering, it was proposed to use the same means for removing snow when not accompanied by too intense a frost; but, secondly, by travelling furnaces for liquefying the snow when accompanied by hard frost, or when the use of water would be inconvenient. In this case the apparatus was to consist of a furnace surmounted by an open metallic vessel with raised sides, but with openings along the bottom of the sides, and a portion of snow being shovelled into the vessel, and melting therein, ran out as hot water and melted a further portion of snow on its way to the street gullies.

The next proposed process was a communication from abroad to Mr. Hughes, the patent agent, whereby snow was to be removed in the following manner. At convenient distances along the street gas-main, branch, or service-pipes were to be fixed, on which hoses of indiarubber, leather, or other convenient elastic material were to be screwed. For clearing a length of 300ft. and a breadth of 180ft., a hose 180ft. in length was employed, wound upon a hose-cart, one end of the hose having a screw coupling corresponding with the thread upon the branch from the main pipe, and at the other end of the hose a metal tube, about 3ft. long, furnished with a stopcock. The tube serves as a handle to the workman for directing the jet of gas, as well as for increasing and decreasing the gas flame. A perforated cylinder forming the gas-burner is screwed to the mouth of the metal tube, the burner varying in length from 6in. to 2ft. When the hose-pipes are connected, and the gas ignited, the operation begins in the centre of each section, the length of which is about 300ft., and the snow and ice of the half-width are melted, the water running into the side channels. For each section one man is employed for directing the gas, another for the service of the hose and hose-cart, and two men with brooms for preventing the spread of the water and for clearing away obstructions, one side of the street being left free for traffic while the other is being cleared. When arrived at the end of the section the men return and clear up the same side of the street in the opposite direction from the centre of the section. The hose is then unscrewed and the opening in the branch pipe closed, and similar operations are performed on the other side of the street. One man can clear 130 square yards in an hour when the depth of the snowfall does not exceed the average depth.

In the year 1875 two engineers, one Bickerton, of Oldham, and Wormald, of Regent's Park, devised an improved means and apparatus for dissolving snow in town streets, the object of which was to dispose of it on the spot by a machine called a digester, of similar form to that of a tank water cart, having fitted to it a furnace, flues, and smoke-pipe, with the furnace at the hinder end of the digester. The flue passed from the furnace to and was connected with the smoke-pipe, which was placed out of the way of the proper filling of the digester. Fuel bunkers and ash-pan formed part of the construction of the machine, and mud doors were placed in convenient positions for cleaning it out. The fire having been lighted and the snow collected towards the sides of the street, it is shovelled up and thrown into the digester through a part of the top left uncovered in the manner in which mud-carts are filled, through temporary openings.

The snow, falling upon the internal furnace-covering and flues, is dissolved, and the machine passes slowly along the street, being drawn by a horse, the water being discharged on the way into the street channels, and is, therefore, not required to be carted away and deposited at some distant spot as at present, but is collected and dealt with at one and the same time. It may be observed that in all the various plans we have described, including the one which seems to us by far the best, and which we have described more in detail, as before mentioned, the snow must be collected as at present, or very similarly, and that it is chiefly in the matter of carting and finding a suitable place of deposit for it that any of these plans are superior to the present one.

DUDLEY GALLERY ART SOCIETY.

THE annual exhibition of water-colours of this society opened on Monday, at the Egyptian Hall, with a collection of drawings and studies that show, if anything, an improvement on previous displays. The president, Mr. Walter Severn, contributes six pictures, illustrating mountain and lake scenery, Loch Lomond, the Clyde, and Mentone being the chief hunting grounds. His "Heather and Birch Trees, Loch Lomond" (261), and "A Cloudy Day" (124), are examples of broad handling; the mass of pink heather in the first, and the sky and quiet lake, and the smooth, reflecting surface of the water, broken by ripples, in the other work, are characteristic of the painter. The view of Mentone, showing the old town and cemetery (191), is large and luminous in colour. As in previous exhibitions, Miss Rose Barton sends two or three clever studies, two illustrating some pretty stanzas:

> "One little child in an ancient church,
> A fair young life in an old old setting."

Another, "The Bishop's Garden" (60), exhibiting in each a touching sentiment. K. Macaulay contributes also one of her crisply-handled coast and craft studies—No. 18, "A Fishing Town," in which we find a free use of opaque pigment thickly laid on—a mode of execution that can hardly be called water-colour. Helen O'Hara is another lady artist of the sea, her "Early Morning" (22), "A Rising Gale" (66), and "Evening near Giant's Causeway" (282) being exceptionally clever studies of white foamy surf and swelling waves, admirable in the colour and minute handling. R. Wane has shown his ability and power in several coast studies, as in No. 27, No. 189, "On the Manx Coast," a headland, and those from Anglesey. We can also admire Sidney Evans's small sketches of Windsor—32, 36, "The Curfew Tower" and the "High Street"—and his views of Eton. Lexden L. Pocock's "On the Avon" (35) and other landscapes are, it is needless to say, thoughtful and painstaking. A very broad and pleasingly-handled landscape is sent by G. J. Carlisle (42), whose other views of Lyndhurst (267), &c., may be noted. Very charming and delicate in tone and handling are Celia P. Culverwell's "Silver Birches" (147), and some drawings by Josephine Culverwell (48, 265); excellent colour and feeling in David Green's "On the Canal, Dordrecht" (51); "A Fair Wind" (55)—a trawler leaving harbour—and some very clever sketches in Holland, especially the painting of boats and fisher-folk (219), and a series of small studies on the screen, all of coast and life by the sea. Dudley Hardy has three cleverly-drawn figure subjects, "Homewards," "Spring," and "Watching" (56, 331, 332). The old shepherd and his flock, and the emblematically-conceived figure of Spring, are drawn with Mr. Hardy's facility; the latter is French in motive. Albert Stevens is strongly represented. The views near Lake Como (57, 302), and notably his "Sunshine and Cloud," are painted with power and subtle colour. J. M. Donne is welcome, as usual, in his colour and atmosphere studies on the higher Alps—No. 73, and his "Chalk Cliffs, Devon" (225) is equally charming in subtle colour and manipulation. Other examples of broad handling colour are Reginald Jones's Dutch fishing boats, "At Dordrecht" (230) and "Land at Dordt" (231). Hubert Medlycott, whose views on the Thames are well known, sends some Venetian lagoons and fishing boats (88, 114, and 128), and a nice sketch at Limehouse (169). Nora Davidson, a new member, shows careful drawing and nice feeling in "Freshening Breeze," "The Far North" (90), and "A Farewell Visit" (67), all marine subjects; the vessel getting up sail in the latter, and the bow of large vessel, No. 90, are promising of future work in this direction. Centrally hung at end of gallery is a study of a girl clad in loose white drapery against a canvas background, "In Idle Mood," by Reginald Barber, is rather meaningless in motive, albeit the drawing and expression are good. Miss Margaret Bernard (121) sends a haymaking sketch of much beauty in drawing and colour; Miss H. Skidmore's "A Glow of Eventide," a charming silhouette effect of landscape; Mrs. Mary Stevens two nice studies of hayfield wild flowers, full of clever technique (118, 122); Mrs. Hartshorne, "Edward the Confessor's Tomb" (276); Miss Mildred Butler, two or three inimitable studies. "A Wood" (153) is admirable in feeling, and the two small sketches of cows reposing (153), and "A Cosy Corner" (317), are also, we need not say, equal to this lady's skill. Harry Goodwin's views of "Lucerne by Twilight" (162) and at sunset (181), with its tile roofs and mirror-like lake, and Claude Hayes' "Yorkshire Hillside" (173), are worth attention. R. A. K. Marshall has a view of the "River Usk, Monmouthshire," full of sunlight (205) and minute delicacy of touch; N. E. Green, a drawing of "West Gate, Winchester" (206) of merit; Heley Smith, a study of girl leaning on a rail overlooking the sea, excellent in drawing and fresh colour—"After the Boats are Gone" (281). Only one study, rather a sketch for a picture, represents historical incident, and that is J. A. Fitzgerald's "The Fall of Wolsey," where the cardinal, after leaving the king, is grossly insulted by mocking courtiers and a man-at-arms. Other works of mark are G. E. S. Walters (311); "British Ironclads" (280), by the President and W. D. Severn, Jun.; T. A. de Moleyns (340); Powell May (83).

DOMESTIC WORK SEEN ON PAST A.A. EXCURSIONS.[*]

(*Concluded from p.* 258.)

AT Stokesay and Somershall Herbert, where the oak has been left untouched, the wood has become delightful in colour, for the most part a silvery grey. Where the tar has been allowed to perish or soak into the wood, as at Severn End, the effect, of course, is less startling. Many a so-called "Magpie" house is quite spoiled architecturally by the absence of repose due to the periodical coatings of pitch with which over-zealous owners bedaub the framings. The original way of filling in these timberings probably was the "dab and wattle" with two or more sheetings of interwoven oak laths and plaster to exclude the wind and weather. Brick filling is, of course, not uncommon, and it is eminently picturesque, giving touches of colour and irregularity, though, from a constructional point of view, it is very heavy and difficult to render satisfactory. Where half-timber building is almost exclusively employed, as at Pitchford and Salwarpe Halls, you will notice that the effect of excessive verticality of form due to the countless number of upright timberings, is overcome by long, low lines of roofs and general proportions, which again are made to prominently dominate by the oversailing of the upper stages. This also is observable in the narrow strips of frontages which occur in contemporary street buildings. The timberings, too, in the best specimens are simple in form and massive in scale, often being allowed to follow the natural shapes of the limbs of the trees from which they were cut. In those smug and conceitedly spruce, high set-up, match-like and meaningless imitations which have brought half-timber house-building into contempt among people of artistic appreciation, the spirit of the style has really never been apprehended at all, and although good taste is not realised in attempting to make a new building, erected for new requirements and modern ideas of comfort, look like an old one, it is certain that the traditional elements of the old work taken as a model must be understood as an inspiring influence in any successful work. The difficulty of obtaining nowadays sound-seasoned timber of ample scantlings, and the general requirements of large windows and tall pitches for our living-rooms, furnish good reasons for not adopting this mode of construction generally for present use, to say nothing about the enhanced risk of fire. For gables and minor portions of a house façade in country dwellings, half-timber is still used with great advantage and a charmingly homely effect. Clients have been heard to remark, I am told, however, that draughty upper floors, windy corridors, and windows perched up so high that no one may look out unless aided by a ladder, are not infrequently the result of an architect's first care having been devoted to the cultivation of the picturesque in half-timber. Turning next to the stone houses under review, we naturally find our examples more numerous, much larger, and of greater variety in date and style. For the practical architect those of English Renaissance period furnish by far the greater points of interest and suggestiveness. The feudal strongholds of Rochester and Ludlow, and such like masses of masonry, consume the antiquary with delight; but to the builder of modern houses the work of Sir Thomas Tresham in Northamptonshire; Burford Priory and Water Eaton in Oxfordshire, and Moreton Corbet in Shropshire, are much more to the point, as also are such examples as Brympton, near Yeovil, with its font, by Inigo Jones; Asthall Manor, near Witney, and Woollas Hall in Somerset. The Edwardian work at Haddon, the Tower of Stokesay, Leeds Castle, Kent, and Penshurst in the same county, and South Wingfield Manor in Derbyshire all have their individual charms, particularly the latter, with its elegant and refined Late Gothic detail. So, too, the ponderously heavy style has its lessons in contrast to such as these, as exemplified at Blenheim, parts of Bolsover Castle, Burleigh-on-the-Hill, Northants; Houghton Hall, for Sir Richard Walpole, in Norfolk, by Colin Campbell; Sudbury Hall, in Derbyshire, a brick house; and Ickworth, another in Suffolk. They teach us broadly what to avoid in new work, while furnishing much that is historically interesting as a reflex of the times they represent, and as records of the men who built them. The Mediæval Domestic buildings which we have seen, commencing with the Norman Hall at Oakham, in Rutland, the older part of Lacock Abbey, Meare Hall and Fish House near Glastonbury, the Vicar's Close, and the Palace at Wells and Lyddington Bede House, in Rutland, on the other hand, each, in turn, exemplify far more that is worthy of our study and attention, even though the failure of the Gothic Revival has, perhaps, demonstrated beyond dispute that a rigid adaptation of the work of the Middle Ages is now an impossibility. In point of general forms, however, and in the same principal scheme of building, the style may, with advantage, still be our guide, even though we must needs considerably modify items of detail. Thus the dominating necessity of high roofs and a good skyline, the advantage of strongly-contrasted proportions of solid and void, and the homelike quality of simple picturesqueness, are all characteristics essential to the suitable treatment of an Englishman's house, be it a cottage or a mansion. The Renaissance, as illustrated in its earlier stages in many of the old specimens which we have seen, successfully realises this idea, and therein we shall do well to follow their lead. They combine all the freedom of the Gothic style, coupled with a sufficient amount of the horizontal method and rectilinear forms suggested by Classical types, while, most important of all, their internal plan and arrangements are expressed externally in their elevations. I do not lay claim to any originality in this statement; indeed, the best of our contemporary work has for some time demonstrated the principle. That its more general use and commonsense development may be rightly extended is ample reason for thus briefly drawing attention to the subject. Our old brick-built houses illustrate precisely the same notion; and while bound to admit that Compton Wynyate is, perhaps, the most delightful house I have ever seen both for colour and suitability of composition as well as detail, I fancy it is to later models that we must rather turn for inspiration. This house, erected in 1525—the same year as dates Hengrave Hall, Suffolk—is more decidedly Tudor in style: a name which, in the 19th century, has had to answer for numberless atrocities. The houses to which I refer are represented by Woollas Hall (1611) and Norton Manor in Worcestershire; Barrington Court, Somerset; Water Eaton and Burford Priory in Oxfordshire; Weekley Hospital and Exton Hall in Northamptonshire; Charlecote in Warwickshire; Brympton, near Yeovil; Rushbrook, Kentwell, and Coldham Halls in Suffolk; the brick part of Severn End, Worcester; St. Catherine's, near Bath; and Plaish Hall in Shropshire. Larger houses such as Moreton Corbet, Montacute, Blickling, Westwood House, near Droitwich, Kirby, Corsham, Court, Rushton, and perhaps Hardwick, deserve the closest study, and for new works of corresponding consequence might possibly be taken as guides, for they are all masterpieces. The craving for the dignity of balance and grandiose effect led their designers, however, into some incongruities, such as a series of sham windows; or big windows cut up inside regardless of their exteriors; or over-fenestration, as at Hardwick, and perhaps useless ones, like the portals at Cobham. Much of their detail, too, lacks refinement, and, at least, in some the construction is radically bad. Take, for example, the masonry of Moreton Corbet in the main front, and notice how clumsily the jointing of the stonework is managed; in some parts the transome stones are run through the window architraves, and in others merely joggled in most awkwardly. The members of the cornices do not mitre properly, and, in some of the breaks, fail to carry on at all. This want of refinement is illustrated by the two details which I shall show you, one of a doorway from this building, and another of a similar doorway from Kirby, which is exquisite in every way. A very similar doorway you will call to mind as having seen at Ashbourne, in Derbyshire, at the Grammar School. The masonry, too, of Burford Priory is also very poor, indeed it could hardly be worse, especially in the unique and beautiful chapel there of somewhat later date. The house itself is probably partly an older building refaced, and, strange as it may seem, some of the stone mouldings round the bay windows are nailed on. This is worse than mason's joints in joinery so common with some fashionable architects now. St. John's College, Oxford, commenced in 1631, and the contemporary Market House at Peterborough, seem perfect examples of the style I so much admire. In the old houses a great feature is nearly always made of the lead stack-pipes and water-heads; but you will observe that for the most part they are used in conjunction with parapets, and not eaves. To employ large massive down-pipes and wrought heads implies a monumental treatment, but quite lately I saw a new mansion recently erected by a well-known London architect, to which most costly lead-work of this character has been applied, taking water from the commonest half-round eaves guttering procurable. Nothing could be more incongruous! There is a wonderful variety of lead-work at Haddon Hall, Woollas, Blickling, and most of the places I have named; but at Canons' Ashby you will find, perhaps, the richest and most beautiful lead heads and spouting to be seen in England. Before passing on to the plaster houses in our list, I should like briefly to name a point observable in some of the brick ones where terracotta was used, such as East Barsham Hall, Norfolk, and Oxburgh Hall in the same county, or Bardwell Manor and West Stowe Hall in Suffolk. There are other specimens, of course, about the country, like the house at Canterbury, and Layer Marney, but these have not been visited on our A. A. excursions. In them all the terracotta is not too much in evidence, but is sparingly used in a subordinate manner; whereas, in our latest editions of this useful material, it has been very much overdone, and the buildings look "as hard as iron." The big heraldic beasts modelled in the clay at East Barsham deserve, too, to be named as specimens of terracotta largely treated, but you will observe how quiet the effect is because the spandrels are inclosed in brickwork. Value is given to the ornament by the contrast of adjoining plainness, for the old builders knew the advantage of concentration and sizes. We, on the other hand, produce our ornament by machinery, and spread it over the entire surface, thinking it looks clever. It may be fine, but it is not good. Our details also now are getting too small in their parts, and ineffective from want of scale. The plaster-fronted houses which we have seen are, for the most part, very plain ones as compared with such specimens as that in the Butter-market at Ipswich, but they are none the less suggestive. We may divide them into two kinds—viz., first, those with rough-cast or plastered stone walls flush with stone dressings, such as Witney Grammar School and the old street houses at Lacock, Corsham, and Burford; secondly, those which are plastered over timber framings, such as the old Georgian Inn at Bury

---

[*] By Maurice B. Adams, F.R.I.B.A. A paper read before the Architectural Association on Friday last, Feb. 5, 1892.

St. Edmund's, the house in the High-street at Oxford, the Cake-shop at Banbury, Bardwell Manor, Suffolk, and the old houses at Maidstone. Most of these we shall see to-night. For my part, I think that there is a capital opportunity open to architects and sculptors for the development of plaster-work in the external treatment of Domestic building. Nothing could be more durable if properly used than stucco duro, say, for the frieze of a house front, or an upper stage under a well projecting eaves. If our younger sculptors would turn their attention to modelling in plaster for architectural purposes, a fine field for the lasting display of great artistic ability would be found, and instead of figure-work in plaster now being prohibitive in price, architects would be enabled to turn to a school of capable and willing artists to co-operate with them in producing work which might compare with that of any period, and reflect the skill which we know exists in a latent form among many who are struggling to become monumental sculptors, but are without patrons. Mr. T. E. Collcutt years ago in Fleet-street showed how plaster-work might be treated with scratched ornament, and the late Mr. F. P. Cockerell did a house at Datchet with plaster panels. Mr. Norman Shaw, foremost in this as in many other matters, has shown us what to do, and so has Mr. T. G. Jackson, A.R.A., as in his High School at Oxford, and Military College outside that city. More, however, remains to be done, and the old houses above-named have inspired others besides ourselves. In respect to the garden-craft details which we have seen at Haddon, Rockingham Castle, Drayton House, Claverton, and St. Catherine's near Bath, Hardwick, and Blickling, as well as Montacute, very much might be said did time allow. The importance of these minor matters of Domestic architecture renders them worthy of more attention than they have lately received, and they certainly should be designed by the architect, and not left to specialists and landscape gardeners. Architects, however, must study and master this branch of their artistic work, if they would render themselves worthy of being intrusted with it. My two last divisions, including Interiors and Furniture, for lack of time, must be even more briefly alluded to than our previous ones. The houses which are remarkable for interior plaster-work among those we have seen are South Wraxhall in Wiltshire, the Reindeer Inn at Banbury, Blickling Hall Library, Lytes Carey in Somerset, Hardwick Hall and Haddon, and the domed drawing-room at Canons' Ashby. The ponderous vulgarity of the Rococo plaster-work at Houghton Hall, Norfolk, and other like specimens, need not detain us, wonderful as it is in size and voluptuousness. Most of the houses visited have been more or less modernised inside; but I can show you some which have not, such as Plaish Hall, Broughton Castle, Haddon, Bolsover, Wollaton, Hardwick, and Pitchford. The chimneypieces from Ightham Mote, Benthall Hall, and Bolsover will interest you. When Mr. Robinson's camera studies have all been seen, I know you will be pleased, but I fear my task attempted too much for one evening. I must leave untouched the furniture we have seen, simply recalling, in conclusion, many a fine example, such as those at Oxburgh Hall, Charlecote, Hardwick, Cobham, Ightham (now dismantled), Brigstock Manor, Rushbrook, Coldham Hall, and other places.

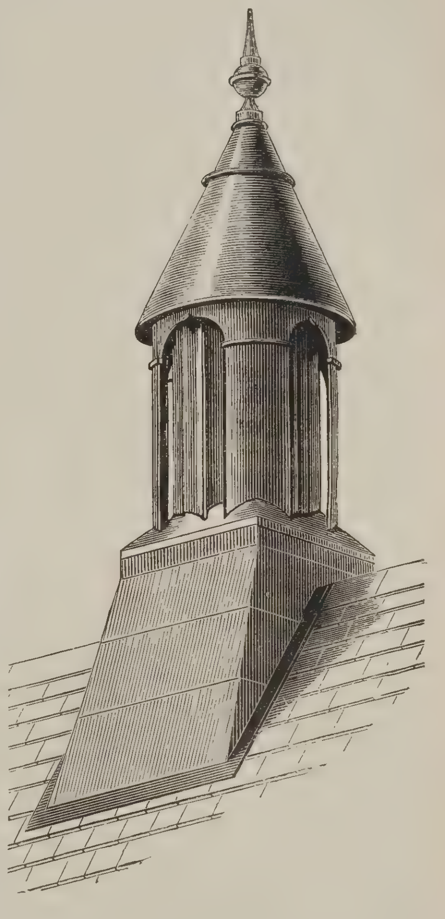
BOYLE'S LATEST IMPROVED AIR-PUMP VENTILATOR.

Mr. Robert Boyle, Managing Director of Messrs. Robert Boyle and Son, Limited, Ventilating Engineers, London and Glasgow, has recently patented an important improvement which he has effected in the well-known air-pump ventilator, which adds considerably to its value as a foul-air exhaust, and Mr. Boyle believes that he has now brought this form of ventilator to the highest state of perfection that it is possible for an automatic ventilator to attain. The ventilator is free from down-draught and impervious to rain or snow, whilst the vibrating noise caused by the impact of the wind on the edges of the plates is, by the new arrangement, done away with. Auxiliary exhaust-chambers may also be fitted to the ventilator, increasing the extracting power 100 per cent., without enlarging the size of the ventilator. This is important where space is a consideration, such as where the ventilator has to be fitted into a flèche or turret. The improved ventilator is made, of an ornamental character, of the best rolled steel plates, galvanised, and painted with enamel paint, and is sold at 50 per cent. less in price than the earlier and inferior forms of the air-pump ventilator.



AN EXPLANATION OF THE LONDON WATER QUESTION.

Under the above title, an interesting paper was read before the Surveyors' Institution at the ordinary general meeting on Monday evening last, by Mr. J. W. Grover, C.E. (Associate). The author commenced by reminding his hearers that when in 1879 Lord Beaconsfield's Government attempted to grapple with this great question, it was to a surveyor, and a past-President of the Institution, that they resorted for advice and assistance in negotiating the purchase of the various companies' undertakings. The question had, he went on to say, been left too much in the past to experts, but now the time had come when, if anything were done, it must be done with the people's money, and it behoved the general public, therefore, to take an intelligent interest in the matter. The subject, vast and difficult as it at first appeared, could, as his experience of thirty years had taught him, be stripped of technicalities, and become simple and easily to be understood. He began by asking, "Why do the eight great water companies exist in London? Whence had they their origin if they do the work which the public bodies should have done?" Why, indeed, he asked, were private Acts of Parliament granted to companies to supply localities which, under the Public Health Act, ought to supply themselves? The answer was, that in every case great risk was in the first place involved, and not infrequently heavy loss resulted, and the ratepayers were, therefore, naturally anxious to shift that risk on to someone else's shoulders. For many generations the great New River Company was a dead loss to the shareholders, and in a lesser degree the same remark held good of the other London Water Companies. The companies had, undoubtedly, been public benefactors, and when the time for buying them out came they would have a fair claim, if on that ground alone, to be treated with justice. But—to state the case for the purchasers—it must be remembered that, in the first place, the companies had no monopoly—only a permission. Anyone could dig himself a well, and attempt, at least, to supply his own wants. Again, the Rivers Thames and Lea were undoubtedly public property, from which the companies are only permitted to draw on payment of some consideration. In 1884 Sir Joseph Bazalgette described London as containing four millions of people, and having a rateable value of twenty-eight millions a year, or £7 per head. The figures were now much higher; but these might be taken as a basis for rough calculation. According to the same authority, the water in 1884 cost each person 7s. per year on an average, which comes to exactly 5 per cent. of the rateable value. The number of houses was half a million, or eight persons to each house. Between 1855 and 1884 the rateable value had risen from £4 per head to £7 as stated, so that notwithstanding that the consumption was practically the same for each person, the fact of the companies charging on the rateable value had materially increased the actual price of the water, and with every valuation of the Metropolis the charge went on increasing. Thus, assuming an increase of one million a year in the value, the companies would, at the present rate of 5 per cent., charge annually £50,000 more for the same amount of water as now supplied. Then if they were to be bought up, this £50,000 at thirty years' purchase meant 1½ millions, which fact alone would prove that what was to be done in this direction must be decided without delay. But, the author asked, would it not involve the ratepayers in serious loss to purchase the companies' interests now? He thought not. The capital of the eight great water companies might be taken at 14½ millions at par, and its present market value at 33½ millions—i.e., ordinary capital 27¾ millions, and preference loans 5¾ millions. The gross revenue was not easy to ascertain, for the land income of the New River Company was an unknown quantity, and the increasing value of land from leases falling in was supposed to be very great. The gross revenue with the New River property was computed at £1,892,000, and the net revenue £1,217,000; but according to the report of Mr. Stoneham to the Local Government Board and the Report of the City Water Inquiry, the net revenue was £1,121,870. Now suppose the lot to be bought up at their present market value of, say, 33½ millions, it was quite certain that the London Water Trust or the County Council could raise money at 3 per cent., or even less. But to take 3 per cent. as a basis of calculation, this would involve a yearly interest of a little over one million. This, taken from the estimated revenue, left a balance of nearly a quarter of a million for a sinking fund, which would be rather more than sufficient to pay off the 33½ millions if allowed to accumulate at 3 per cent. interest for 60 years; but if, as in the case of the Sheffield Water Bill, the time for repayment were extended to 90 years, then a profit of some £140,000 per annum would be shown. Even taking the lowest estimate of the present revenue of the companies, the whole loan could be repaid in 90 years with a fair annual margin of profit. The centralisation of the water companies' work under one authority would, moreover, effect a great saving in the expenses of staff, directors' fees, shareholders' meetings, and in many other directions, and the convenience of being able to supply any part of the town irrespective of legal districts would be enormous. In the case of the annexation by the two great gas companies which supply London, of smaller companies, each step in the direction of unity had resulted in a lowering of prices to the consumer, and the same result would no doubt follow in the case of the water companies. The author, in passing, wished to point out what he could not but consider a popular error—viz., that the domestic supply of water would be better if paid for by meter. Only very expensive meters could be relied on to register small quantities of water, and if all London were to be supplied on this system, an additional three or four millions of capital would be required for meters. Again, on sanitary grounds, any inducement to the consumer to restrict the use of water would be very objectionable, while the poor man, who now, on his small rateable assessment, pays, on an average, something like 1s. per head in water rates, would be put on a level with the rich man, who, in a larger house, but with no larger family, pays, perhaps, £1 per head, to the manifest advantage of the poorer neighbourhood. The author next proceeded to deal with the present supply. Forty years ago the supply to London was 44 million gallons per day; now it was 167 millions, while in July, 1889, it was as much as 186 million gallons daily. Of the 167 millions per day, the Thames supplied one-half, or 85 millions; the Lea about one-half, or 58 millions; springs and wells, about 24 millions. Each year consumers increase at the enormous rate of 130,000 persons, the net water rentals by £36,722. The average number of persons supplied in each house averaged nearly 7½. The springs and wells situate in the valley of the Lea and in Kent could not be relied on for a much further increase of supply, nor could the River Lea itself, which was already too much drawn upon. The true source of the future supply must be the great basin of the Thames itself. The area drained by the Thames above Hampton was, said Mr. Grover, 3,465 square miles, the daily average discharge at Teddington being 1,100 million gallons, while dry-weather flow was rarely below 300 million gallons. On exceptionally low days the companies had occasionally drawn as much as one-fourth of the entire flow. They were allowed to take as much as 130 millions of gallons a day, although, as a fact, they did not draw more than 100 millions. The area of the valley of the Thames above the water companies' intake might be reckoned at 1½ million acres, every 1,000 acres yielding one million gallons per day, which, by means of wells and headings, might be made available. The chalk forming the Thames basin ought to be the reservoir, as yielding the purest and best water, freest from organic matter, and of the most equable temperature. The filtration was, as stated by Dr. Frankland in his report to the Local Government Board, infinitely superior to any which by an artificial process endeavoured to imitate the exhaustive filtration which deep-well water underwent. In 1901 it was probable that London would require some 45 millions of gallons per day more than the present supply could provide, and it was towards this supplemental supply that attention must be directed before the water question for the Metropolis could be considered anywhere near solution. The Lake of Bala and other Welsh sources had been suggested; but it was forgotten that the Welsh hills had to supply their own rivers, the Severn, the Dee, and the Wye, and the inhabitants would scarcely allow their own supply to be taken away without compensation, even if it could be done at all. As a principle, it might indeed be laid down that running streams could not be drawn on unless the district through which they flowed were compensated. After briefly explaining the geology of the strata immediately underlying London, Mr. Grover proceeded to show how, although it was quite possible, by going 200ft. or 300ft., to get water from a well on any part of the district, yet the supply was limited, and only in certain spots at all satisfactory; but all round London, where the chalk crops out or comes above the clay, wells might be sunk with the best results. The New River Company's spring at Amwell was an instance of this; but this great spring practically exhausted the valley, so that little more must be looked for from that district. But there were two districts, one the Leatherhead or Mole district, and the other the Rickmansworth or Colne district, which would yield a large immediate supplemental supply, both of which districts had been assigned to water companies by Parliamentary authority; but to each of them permission had been given to deal with the surplus water, so that the coming need of London could practically be met by supplies from these sources. Mr. Grover went into some detail to show how this could be done: he demonstrated how, taking the average rainfall, an ample supply would be forthcoming from the valleys drained by the streams of these areas, and, basing his figures on actual experience of wells already sunk there, contended that to these two districts we must, at all events in the near future, look for the supply which the growing necessities of London would demand.

A short discussion, in which Mr. A. M. Dunlop, Mr. F. K. Munton, and Mr. J. G. Rhodes, L.C.C., joined, then took place, and, on the motion of Mr. C. K. Bedells, was adjourned to the next meeting.

NOTES ON TERRACOTTA.*—VII.

SECTIONS.

When cellular terracotta is required with a moulded edge or face, it is first produced as a rectangular block, and the required section is then brought about by the removal of the surplus clay of the rectangular edge and portions of the adjacent faces. The block, or blocks, are placed on a firm bench 6ft. or 7ft. in length, having a true upper face and wrought edge at right angles, the outer edge of the blocks being placed parallel with the wrought edge of the bench. A plasterer's running mould of the required section is made, with a rebated shoe, or "horse," technically so called, to fit the edge of the bench, as at *a*, Fig. 1, the clay blocks being sufficiently removed to give the edge of the running mould a firm bearing on the bench, as at *b*, during the act of working the mould. The block of clay is then technically "run" until the required section is produced. Before working the moulding as above described, the blocks are cut to a certain length and width—say 12in. long with 4½in. bed, measured from the wall-line—and are then "run" in single blocks, or in a continuous line of six or seven blocks. Fig. 1 represents the method and working. The distance of the first line of perforations from the outer edge must, of course, be determined by the depth of the moulded member, or *vice versâ*. Several unsuccessful attempts have been made at different times to produce terracotta in the solid clay, some of which have come under the writer's personal observation, in the shape of massive bar tracery. In each case, the impracticability of the attempt became apparent in the drying process, owing to the solid block drying gradually from the outside faces in an inward direction, instead of simultaneously from the outside and the inside, as in the case o hollow blocks, and resulting in the developmen of cracks over the exposed faces. Even with the reduced conventional brick sizes of to-day, some of the very best bricks, in other respects, tha come into the market, notwithstanding th stereotyped expression to the contrary, ar difficult to obtain "true in shape and form";—a fact so well recognised by the building trade that a bricklayer has been defined as "one wh builds straight walls with crooked material." It is only reasonable to believe that the early clay workers of Egypt and of Rome attempted soli blocks of a size much larger than any of th existing types that have come down to us fro those nations, and that they failed in exactly th same way that we have failed; consequent upo the nature of the material in which they worked The same cannot be said of early terracott appearing in the forms of ancient pottery. Th British Museum is said to contain 5,000 Grecia and Etruscan vases; and public and privat collections are said to exceed 40,000 in al some of them little more than ⅛in. i thickness. These beautiful vases, chiefly mad up of the subtle curves of the conic sections—a characteristic of the Grecian mouldings—are not only true in form, but were made in many instances, exact in capacity, bearing o their painted and enamelled exteriors representations of the current and living thought of th best periods of Grecian art. Homer has celebrated the potter's art in one of his hymn addressed to the potters of the island of Samos and the Ancient Assyrians, to show their hig esteem of the art, deified it under the name o Nunurra, the god of pottery. Fig 2 shows return "run," worked in the same way a in Fig. 1. The angle of the return end of th bench must, of course, be the same as the ang required for the return—90° or otherwise. I circular work the moulding would be "run" o

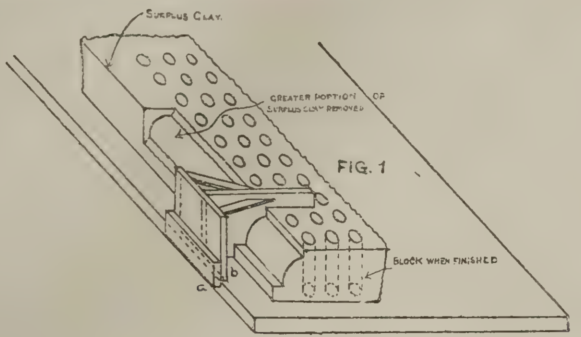

FIG. 1

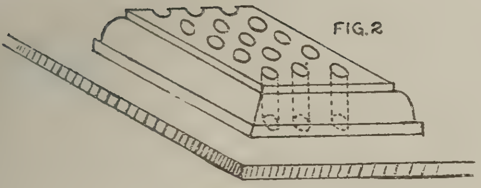

FIG. 2

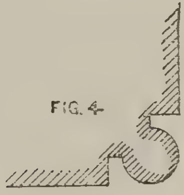

FIG. 4

worked by means of a trammel mould, as hown by Fig. 3, *a* being the centre of the ircle of which the required moulding is an arc. The centre *a* is built up, cone-shaped, in plaster f Paris, with a dovetailed wooden block bedded r fixed at the top to take a gimlet penetrating he radius rod *b*, at the opposite end of which s fixed the running mould *c*, showing a section f the Norman edge-roll or bowtell, which, next n order to the chamfer and the ovals of large ype, lends itself most readily to a true reproduction in terracotta, this member being divided rom the plain faces by shallow channels only— characteristic of the period to which it belongs —instead of being deeply incut, as shown by the adjoining Fig. 4, a section which should not be attempted in terracotta: the semi-cylindrical form of head is its proper substitute. An object-lesson illustrative of the preceding remarks may be seen at the "King's Weighhouse Congregational Chapel," Duke-street, London, W., a terracotta treatment of a design essentially Norman n character, the predominating features being the round edge-roll and a free use of isolated and engaged columns of small diameter—more properly called shafts—showing that the circular section, when of a uniform thickness throughout, s the most suitable of all sections in this material —so true are they in form and build. Columns of large diameter should be "broken up" by vertical as well as by cylindrical jointing.

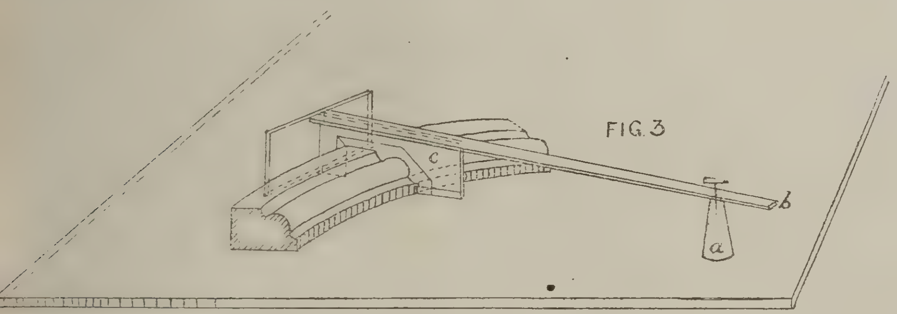

FIG. 3

MANUFACTURE.

In the nomenclature of the manufacturing process *moulded* work is understood to be that work produced by the filling in by hand of plaster of Paris piece moulds, which have been taken off the "original" or model, as already described; while *pressed* work is that produced by being forced through a "die," or otherwise brought by a single operation to the required finished form from the crude clay lump. In all cases, where practicable, the filling-in or open side of the mould, should represent the top bed of the block when *in situ* on the building. In this way the concrete filling-in will be made to take the weight of the superincumbent blocks when fixed; the two ends being formed with "chisel" or "chipping" joints (sometimes called panelled ends, described and illustrated in a previous article), to readily admit of the blocks being reduced in length, should they require it, as well as to afford a means of longitudinally dowelling the blocks by grouting. In the process of moulding, the block is built up by the clay being placed apron-like against each side of the mould in consecutive order until all the sides, and in some cases the bottom, are covered. Struts are then built across the mould and well kneaded into the clay lining the mould, forming in plan a kind of diaphragm. The number and disposition of the struts should be determined by the size and shape of the blocks. In a block forming a parallelogram the struts might be parallel where there are more than one; but in a square block they should be preferably at right angles with each other. In all cases the struts should be the same thickness as the sides of the blocks of which they form a part. They serve the double purpose of supporting the sides of the blocks while in the moulds and during the process of drying, as well as affording a build for the work where the blocks are used without being "loaded," i.e., filled in with cement concrete—a practice in all cases to be deprecated. The length of time that the clay shall remain in the mould must be determined by the nature of the work, and its capability of retaining its form minus the support of the mould. The great evil of using the mould too rapidly is that it becomes what the moulder calls "sweaty," that is to say, the moisture imbibed from the clay by the plaster of Paris mould is not allowed to evaporate before the mould is again filled in, and this process being repeated, the material of the mould becomes ultimately saturated; to obviate which the moulder has a fashion of dusting the mould to absorb the surplus moisture, for the purpose of turning out the work more rapidly than he otherwise could. The dust is obtained from the purest clay pulverised, and is placed in a piece of muslin or other loose fabric of an open mesh, through which it is sifted, as it were, on to the inside faces of the mould, forming a fine surface coating thereon. After a short time the mould is again filled in with clay, and it is found, when the mould is removed, that the fine dust has been transferred to the clay block. This has been fully described because the writer can in no other way account for the fact that blocks made from the very best, natural, unadulterated clays, and thoroughly fired, are found after a few years' exposure to have shed their fine surface coating, exposing to view a rough under-surface, such that might reasonably be expected to result from the dusting of the moulds, or otherwise from the practice of "dipping," as previously described.

CARPENTRY AND JOINERY.—XLII.

PEDIMENTS.

A PEDIMENT is the triangular panel (tympanum) resting upon the entablature, and includes also the cornice which surmounts it. This definition is brief, but comprehensive enough to introduce the remarks and illustrations which follow. It was stated in the previous article that entablatures were being treated as a step to pediments. It has been also stated that there are several other outlines of pediments besides the triangular, and that the various mouldings which form the cornice of the entablature, except the upper one, occupy the same position, even if a pediment surmounts it.

Fig. 279 shows the upper portion of an entablature—that is, its cornice, and also part of the pediment. The points stated are illustrated. Be it noted that in this case there does not occur what is commonly known as a *raking moulding*, and therefore no difficulty presents itself to the joiner in getting up such a pediment. The raking moulding would be the top member of the cornice along the slope of the pediment. The remaining portion would not be affected, seeing all the other members terminate on the entablature, and within its outer edge, each member receding further from the outer edge as the tympanum is encroached upon. In building up this pediment the joiner will proceed as for an entablature, except that the fascia, frieze, or backing-board shall include the tympanum—that is, the triangular portion, which serves to screw the mouldings to, and should reach up sufficiently far to take all these, and within ½in. of the outer limit of the *ogee*, or outer moulding of the cornice; this ½in. being allowed in order that the covering board may extend over it similar to that shown in Figs. 275 and 278 in the previous article. It is expected that the pediment has been drawn full-size upon a workshop drawing-board or panel, which includes that the mouldings shall have been drawn somewhat similarly to what is shown in Fig. 279, and this will enable the joiner to work every portion quite accurately, as he will thus be able to obtain all the measurements exactly. There are, properly speaking, two bevels only in this pediment, one being the *plumb cut*, which is the mitre or intersection of all the mouldings at the apex or top of the tympanum, and the other is a *level cut*, and forms a right angle with the plumb cut, and this is the ordinary rule in the case of all roofs, and is a point to be noted by carpenters, as when one cut is known the other is obtainable from it. It

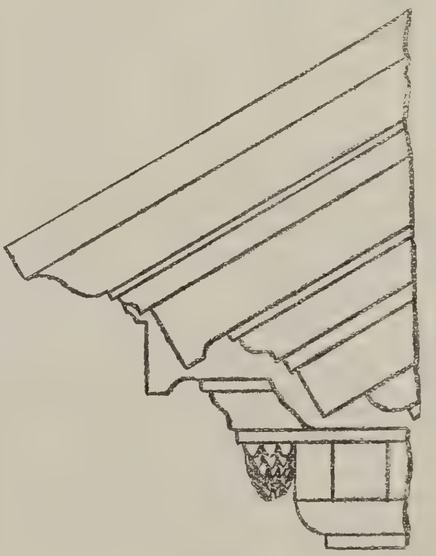

Fig. 279.

has been stated that no raking moulding occurs in this pediment, the reason being that all the mouldings intersect at the top, and all except the ogee terminate on the entablature with a level cut; the only place where any difficulty could present itself would be the ogee from the front returning along the end into the wall or back of the entablature and pediment. But the back of this moulding is shown to be at right angles or square off the raking or sloping line of the pediment, and therefore an ordinary mitre suits at the angle; and the return moulding is of the same section as that along the sloping line of the pediment. It may be here stated that of those pediments coming under the writer's notice, the greater number, triangular in outline, have the ogee returned in this way.

Anything that may give rise to objection in this is the square above the ogee. When seen from the front it overhangs a little, instead of being vertical.

Fig. 280 gives the two outlines of the mouldings according to the requirement. On the left hand a moulding is shown which would be similar in section throughout, for the returns as well along the raking or sloping line of the pediment. It is seen that all that is required is obtained by *canting* or tilting the moulding, so that its upper surface or edge is in the same line as the moulding along the pediment. In the case of the moulding on the right hand in the same figure, it will be readily seen the moulding is perpendicular—that is, the back is vertical where it lies against the pediment, as also the square in front; but the upper edge is bevelled to suit the rake of the pediment. Now, it is easily observable that anything gained is that the square of the moulding in the one case overhangs, whilst in the other it is vertical.

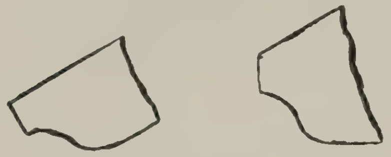

Fig. 280.

The difference in the ogee proper, apart from the square, would at the height be scarcely noticed by the most practised eye. There are other minor points in Classic architecture upon which authorities differ very widely; so whilst some assert this return moulding should be vertical, it is found that very generally in practice, as has been stated, it is *canted*. With reference to raking mouldings, a short cut the joiner may take in practice is, providing he has a piece of the ordinary moulding, the section of the raking moulding may be obtained by cutting the ordinary moulding at such an angle as will give the breadth required at the back—that is to say, your ordinary moulding is 3in. broad, and your raking moulding requires to be 4¼in., turn the back of the moulding and draw a line across the moulding at where 4¼in. intersects both edges, and by taking a shaving off the end to clean it and turning this cut up and laying it on a piece of paper or board you can trace it, and this is the required raking moulding.

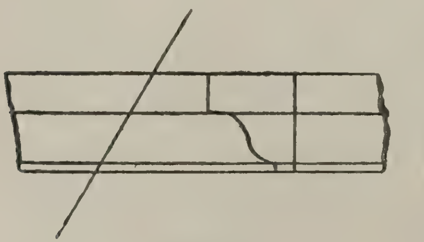

Fig. 281.

Fig. 281 gives the idea of what is intended, showing a section of the moulding, and a line drawn across and continued (imaginary) to make the matter clear. In extension, if the moulding is required to rake both ways, then simply put a level line on the top edge of the moulding, as well as on the back, and, with the saw, cut this, which will give, when cut, the required section. It will be seen that such a cut would be similar to the raking cut of a rafter, where it abuts against the *diagonal*.

It may be also observed that it is merely the facial, or front, outline of the moulding, which is specially intended, as the joiner will arrange for the top edge of the required moulding, according as it is bevelled, or square.

Fig. 282 gives the ordinary way of getting out a raking moulding; the exact principle of which would be to divide the line of the back of the moulding into a number of equal parts; or carry lines from the more conspicuous parts of the moulding, then carry these along till they meet a line drawn at the required angle, which is of the length sought. Square out from the inclined line those lines which were carried to meet it, or, more strictly speaking, from the point where the lines which were carried across meet the inclined line. Square out lines, and then take the different projections from the original moulding, and transfer them to their respective lines, measuring from the inclined line. Now trace the required raking moulding through these points. If, on the other hand, a less moulding is required, the process may be reversed. There are other methods of obtaining the required result; but if the joiner has thoroughly grasped the idea in this he will have no difficulty; and it will be very easy for him to learn another method if required; but the writer's experience has been that what one knows thoroughly, though it be a roundabout method, he will do it more quickly than a readier method which he is less sure of. In regard to the dentils of the pediment, they are placed perpendicularly, and at the apex the preferable and easier way is to have the space required between two dentils instead of putting a dentil there. The eye will mentally trace the lines to meet in the centre of the space that is the line of the bottom edge of the dentils on each side. This obviates a dentil made V-shaped (in and out) to fit the opposite sloping sides. It will be clear that to keep the dentils vertical in a pediment whose top slopes right and left, the dentils must be sloped at the top and bottom; this may be done by cutting them in a box having the required cuts to guide the saw, then the ends may be planed, or, with one of the modern *mitring* machines, the guides of which may be set to any angle, a shaving or so may be taken off each end, providing, of course, that in cutting with the saw, allowance was made for this by leaving on a little extra in length.

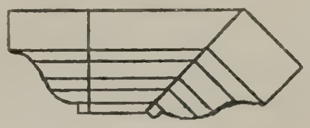

Fig. 282.

Fig. 283 gives a somewhat crude outline of half an *open* pediment.

It is seen that in the centre upon the top of the entablature, a pedestal serves to support a turned finial; sometimes instead the pedestal supports a bust or *heraldic* emblem. Sometimes the heraldic emblem is introduced in the tympanum. Again, the pediment may take the outline shown in Fig. 284, the working out of which is two circles as shown. These are usually carved in resemblance of a flower in full bloom or similar device: the kind of scroll starts away from this and terminates or rests upon the emblature. This scroll or outline is intended to represent rather the moulding which bounds the pediment; where it rests down upon the entablature the outer limit of the moulding will be just equal with the outer projection of the entablature. In working this it is customary to get out a pattern of the half-outline of the moulding, including, of course, the circle. Then cut out the timber to this, plane it up to the template; have a section of its required moulding, and also a section of its reverse, for if it has to be wrought by hand this must be applied, as the ends cannot well be marked. The joiner should put as many gauge-lines on as possible prior to commencing to work the moulding, so as to be well guided, and so as that the requisite tools under the workman's guidance will complete the work readily. It is of the utmost importance that for the proposed hand-worked moulding the workman should have gouges when required to the exact outline, as with these and the gauge-lines little difficulty will occur. The only drawback he will likely meet with in the direction of the tools will arise from the cost, as the market is fully supplied. To refer again to Mr. Greenslade's drawings of 23rd Oct., there occurs the segmental and triangular outline of pediments, also the triangular with a level piece at each side to flank the triangle; this last outline does away with a raking moulding. Then I have given two other outlines in Figs. 283 and 284. Let it be observed the return moulding, which occurs just opposite the finial, is a *raking* one. Now the above are the outlines usually met with in this department, some of which are deprecated. One eminent authority contends for simplicity as being most effective, and pleading rather for the triangular, with a rise or height equal to ⅕th the span.

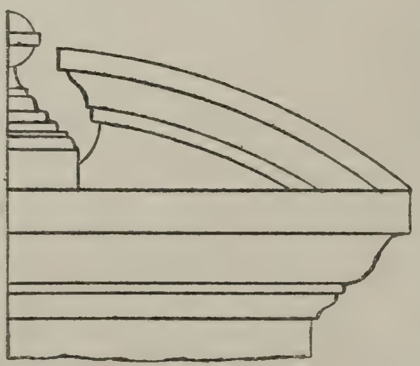

Fig. 283.

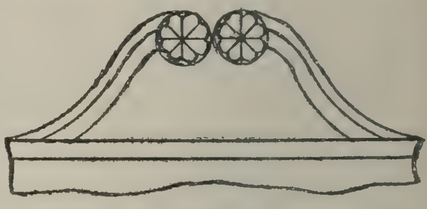

Fig. 284.

In conclusion, whilst as in other departments the writer pretends not to have exhausted the subject, but has tried to direct close attention to it, giving what is hoped may be considered good preliminary instruction, which it is wished will cause joiners to observe the specimens of this ornamentation which will come under their notice readily in insurance offices, chambers of commerce, banks, &c.

The writer will proceed next in order to deal with skirtings, plinths, &c.

A. C. Skilling.

* * *

CHIPS.

Mr. Bolton's Leaseholds Bill, which passed its second reading and through committee in the House of Commons this week, and is set down for third reading to-day (Friday), is chiefly intended to limit the arbitrary power at present possessed by ground landlords in cases of breach of covenant, with a view more especially to the protection of sub-lessees. The Bill passed the House of Commons last Session, but was stopped in the House of Lords, as the Government desired further time for the consideration of its provisions.

The London County Council at their meeting on Tuesday resolved to apply to the Board of Trade for the appointment of an arbitrator in regard to the purchase of the undertaking of the London Street Tramways Company.

Mr. Hans St. George Caulfeild, C.E., late the general manager and engineer to the Government Railways, Madras, died on Sunday at his residence in Chapel-road, Ealing, aged 54 years.

Among the adjudications in bankruptcy announced in Tuesday's *Gazette* the names occur of Richard Tipton, of Endel-street and Langley-street, Long Acre, and Little King-street, Camden Town, builder and contractor; and of Alfred Lonsdale, of Hull, builder.

The Polsham Board Schools, Somerset, are being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, grates, and vertical inlet tubes, the same being supplied by Mr. E. H. Shorland, of Manchester.

ROYAL ACADEMY GOLD MEDAL DESIGNS FOR A TOWN HOUSE.—THE LADY-CHAPEL AND PRENTICE'S PILLAR AT ROSSLYN CHAPEL.—MURAL PAINTINGS FROM THE CHURCH OF THE HOLY CROSS, BERLIN.—THE "OSBORNE" WALL PAPER.—BACK-TO-BACK HOUSES AT BRADFORD.—A SACRISTY CUPBOARD.

Our Illustrations.

ROYAL ACADEMY GOLD MEDAL COMPETITION DESIGNS FOR A TOWN HOUSE.

This recent competition, held at Burlington House, is well illustrated by the three very differing designs which we publish to-day. A special feature to be observed in the planning of the building was to provide proper and convenient space in the living and reception rooms for the display of works of art and paintings of large size. The best design submitted, judged from an architectural point of view, was, no doubt, that by Mr. Alexander Mackintosh, of which we give the view and plans on the accompanying double-page plate. The provision of galleries specially devoted to the hanging of pictures and exhibition of sculpture was not intended in the conditions of the competition as herein adopted. The other two designs are very unlike this elevation, and contrast strikingly with each other. Mr. Herbert Baker's façade is severe and dignified in style, and a prominent feature is made of the entrance porch. Mr. Charles S. Spooner conceived the site of the intended house to be located on one side of an open square, and treated his front accordingly. We reviewed the designs briefly at the time the drawings were on view at the Royal Academy. The plans published with the several views will explain how the authors have worked out the problem, and we have nothing to add here. We shall, at an early day, give some details of Mr. Mackintosh's mansion.

ROSSLYN CHAPEL.

The chapel at Rosslyn, founded in the middle of the 15th century, was the work of the Earl of Orkney of the period. The chapel, reckoned in the money value of our day, cost four hundred thousand pounds. In the accounts for the chapel there appeared large sums for wood, whereas in the building itself there is not a scrap of wood except what has recently been introduced. The explanation was that William Lord Sinclair worked without plans, and that when a workman brought him a design, he was asked to furnish a full model of it in wood. Some features of the design remind one of Glasgow Cathedral, and which are so marked that they can scarcely have been accidental. The peculiarity of the barrel roof of the choir suggests the question as to whether this was the original intention to have that vault only, as all the collegiate churches known had a thick roof. The flying buttresses outside would also lead one to expect a groined roof. The explanation seems to be this. There were two periods of church-building in Scotland, separated by more than a century. The first, beginning about 1057 A.D, lasted two centuries. During that period Scottish architecture followed that of England. The second period, to which Rosslyn belonged, began in the 15th century, and continued till the Reformation. During the interval between the periods Scottish builders were principally engaged in erecting castles of a modified Norman type, and they might be said to have lost touch with Gothic architecture. When they came to take it up again, it was not surprising to find many features common in the castles, such as the barrel vault, introduced in the chapels. Another feature of the chapel which may also be ascribed to this cause is, the vaulting of the north and south aisles. These vaults sprang from stone lintels laid across the aisles from the outside wall to the top of the pillars in the nave arcade, and this was a style which was not to be expected. It was not to be presumed that the builders of Rosslyn were unacquainted with the groined roof, but they were simply following the examples of their own day. The wonderful richness of the colouring which age has given to the chapel, both within and without, is a great feature, enhancing the interest and beauty of the elaborate carvings which cover nearly every portion of its intricate design, combining as it does the solidity of the Norman with the decoration of the Latest phase of the Tudor period. The old story of the "Prentice's Pillar" is almost too familiar to repeat here. The master mason, being unable to satisfy himself as to the detail to be adopted for this part of the building, proceeded to the Continent to study some older example. While he was away his apprentice completed the shaft as we see it. The master, on his return, was so enraged with his pupil that he murdered him for his trouble by striking him over the head with a mallet. The interior of the chapel was illustrated from a sketch by Mr. J. B. Tyerman in the Building News for July 24, 1885, and from a drawing by Mr. John Begg in our issue of April 12, 1889.

MURAL PAINTINGS: CHURCH OF THE HOLY CROSS, BERLIN.

These decorations by Messrs. Ehrich and Doeringer have been executed, together with many others of like character, in the choir of the new church of the Holy Cross, Berlin, which was designed by Professor Johannes Otzen, architect, of Berlin. This building is erected in brick with glazed work freely introduced, and a considerable portion of its ornament is constructional. We have on former occasions alluded to the designs and executed works by this same distinguished architect, and to-day we draw attention to the folio publication illustrative of his buildings, which Herr von Ernst Wasmuth, of Berlin, is now bringing out in parts. The third folio is now before us, and those who are interested in the use of parti-coloured brick and tile or terracotta works will find this book useful and suggestive. The designs are chiefly of churches and their details.

"THE OSBORNE" WALL-PAPER DECORATION.

Messrs. Jeffrey and Co. have just issued their season's series of designs for wall and ceiling decoration, and we have to-day selected one of their new patterns for illustration among our lithographic plates. It has been designed by Mr. H. W. Batley, and in execution we need hardly say is rendered in an artistic way in many varied treatments of colouring. As a matter of fact our reproduction can only show the general forms of the composition: its tintings, often so delicate and harmonious, cannot be studied except in the actual examples. Thus "The Osborne" designs, with the foliations in three quiet soft peacock blues, stand out in a strikingly bold way on an old gold talc ground, giving just sufficient brightness without glare to enhance the richness of the pattern. In rich salmon-reds, with waterlinings of gold printed on a ribbed paper, the design looks quite another thing, and in warm yellows and creams, on a talc gold backing, it is equally handsome. The same designer has a kindred composition, called "The Balmoral," which goes well with the same frieze. In this pattern, however, there seems to be an even greater variety of colouring than in the other, ranging from the pale pink to deep reds and blues on a sprig-enlivened background. Our choice would be awarded to the prints in yellow, with primrose talc filling. The best paper, perhaps, of the whole series, judged from present fashion's phase, is Mr. Lewis F. Day's arrangement of poppies. The blue flower and pale-green treatment for the foliage is exceedingly effective and capitally drawn—much larger in scale and less liney than Mr. Day's designs frequently have been. The dividing string-course pattern between the paper and the frieze is large and effective, and the foliage of the frieze is well conventionalised, without loss of the natural growing forms of the plant adopted in the pattern. The yellow poppies on a dark sage ground form a happy and rich rendering. The Persian-like pattern, called "The Mecca," by the same hand, is well drawn, and adapted to staircases. Mr. Walter Crane's "Cockatoo" design, like all his work, is conspicuous for its originality, though we hardly think the design is up to his usual standard of excellence. The birds terminate in abrupt scrolls, which contrast strangely with the naturally-drawn cockatoos, and the composite fleur-de-lis below stands out rather too conspicuously in scale, if not in colour. In Mr. Crane's own colouring, the pattern is undoubtedly effective with the squirrels and the peacocks. By far the most commanding and grand in style is "The Genoese," a large, bold design copied from some rare old silk. This, in yellows and gold, or flock in claret on ribbed gold, is quite the handsomest paper we have seen this season. For big rooms, nothing could be better in the way of good wall-papers. The same firm's machine-printed papers deserve mention. Their Florentine embossed leather paper in gold, on a clear green ground, is simply superb. Its design is admirable.

SACRISTY CUPBOARD, SCHÖNFELD CHURCH, NEAR STENDAL.

In the illustration the background of the ornamentation might be carefully stained or coloured a rich subdued blue or dragon-blood red. The hinges, which are plain and substantial, are carried round the return ends and help to bind the work together. We are indebted to "Die Architektur der Hannoverschen Schule," by Gustav Schönermark, published by Herrn Manz and Lange, of Hanover, for the plate from which our drawing was made. This work is now being issued in parts, and contains much contemporary work of an interesting character.

CHIPS.

Messrs. R. Waygood and Co.—whose admirable exhibits, by the way, no one should miss at the Crystal Palace Electrical Exhibition just now—have just issued a handy and useful abridged catalogue of their lifts, cranes, hoists, iron doors, pumps, engines, mills, shafting, &c.

At the Bolton Town Hall on the 11th inst. Major-general Crozier, R.E., Local Government Board inspector, held an inquiry into an application by the Corporation for approval of the appropriation by them of corporate land for the purposes of a Public Library, and for sanction to borrow £1,000 for the erection of such public library. Mr. Murphy, the architect, was called, and explained his plans for the new building.

Mr. Justice Denman and a special jury tried an action on Saturday to recover damages brought by a Mr. Plato and his wife against Mr. Toye, landlord of some "model dwellings" in Mansford-street buildings, Old Bethnal Green-road, for losses sustained by the alleged insanitary state of a tenement occupied by them. Their four children died after being attacked with diphtheria, and Mr. and Mrs. Plato were also ill. The jury awarded the plaintiffs £77 10s.

A new Wesleyan chapel in Tollgavel, Beverley, was opened on Wednesday week. It is Italian in style, and has cost £4,000. Messrs. Morley and Woodhouse, of Bradford and Bolton, are the architects.

The estimates deposited for Parliamentary purposes in connection with the proposed extension of the Manchester, Sheffield, and Lincolnshire Railway to London, by Messrs. Liddell and Ross, the engineers to the company, show that the new works necessary for the undertaking include nearly 112 miles of railway, three furlongs of widenings of the present main line, and the laying out of seven new roads, and the total cost is set down at £6,573,729.

Good progress is being made with the erection of a suite of public rooms at Bodmin for a company. Messrs. Ralling and Tonar, of Exeter, are the architects, and Mr. Sampson Trehane, of Liskeard, is the contractor. The cost will be about £3,500.

It has been decided to restore and complete the parish church of Erdington, near Birmingham, in accordance with plans prepared by Mr. J. A. Chatwin, of the latter city. The work will include the reroofing of a portion of the chancel, the making of a central aisle in the nave, as well as aisles on the north and south side, and the reseating of the nave. This work is estimated to cost about £2,000.

BACK-TO-BACK HOUSES.

THE question of the housing of the working classes is always more or less to the front, and latterly the erection of back-to-back houses has been more particularly under discussion. Bradford is notorious as one of the few large towns where back-to-back houses are still being built, and at the recent meeting of the Yorkshire Society of Medical Officers of Health in Bradford, Dr. J. H. Bell read a paper championing this style of dwelling, which has since excited much interest in sanitarian circles. Dr. Bell's contention was that the objection to back-to-back houses from a sanitary point of view was not founded on facts but on prejudice, and by carefully compiled statistics he made it clear that the death-rate in different classes of single dwellings in Bradford was 15·8, 16·6, and 17·0, as compared with 21·3, the mean yearly rate of the borough for the five years 1885-90, and he declared that on a consideration of the whole facts he did not think back-to-back houses could fairly be condemned. Medical men, on the other hand, say that this class of house is essentially insanitary, that every effort should be made to convert them into through houses, and their future erection prohibited. But if Bradford was to forbid back-to-back houses, newly-married persons or aged couples, who have small needs in the way of house room, would be unable to obtain a home with less than four rooms in it, and would probably live with someone else, thus minimising the home life on which moralists lay so much stress. Neither should it be forgotten that there are many towns where the housing question is yet more pressing than in Bradford. For example, in Glasgow it is estimated no less than 40,000 families occupy single rooms, though such rooms are arranged more conveniently for their purpose than a single room in a Yorkshire house, whilst in Continental cities the overcrowding is appalling. To decide between the claims of the present and the future, and between the demands of sanitation and the pocket, is no easy task; but, at the same time, architects might well devote a little ingenuity to the devising of houses which shall combine as far as may be the advantages of through ventilation with the essential condition of meeting the financial position of poor people. The examples of back-to-back houses which we to-day illustrate have been lately erected in Bradford, from the plans of Mr. John Jackson, architect.

◆

Mr. William Roper, builder, of Broomfield-road, Chelmsford, died on Wednesday week, aged 80 years.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—This association met on Thursday, the 11th inst., in the hall, 42, George-street, Edinburgh, under the chairmanship of Mr. John Kinross. Sheriff Mackay read a paper on "The Architecture of Scottish Towns, as illustrating Scottish History." Taking the four periods of Scottish history—the Celtic-Roman, the Celtic-Saxon, the Scottish-Norman or Feudal, and the British or Modern—he described the known architecture characteristic of each.

◆

Miss Katherine Stewart Forbes, late of Chester House, Wimbledon, who died on December 28, has bequeathed two pictures—an "Italian Warrior," supposed to be by Tintoretto, and "Three Children," by Stothart—to the National Gallery.

At a meeting of the Dover town council on Friday, the mayor made an important announcement with reference to the new harbour at Dover. He stated that it was expected that at the April meeting of the Harbour Board the tender for the first part of the new work, the eastern arm, to the amount of £300,000, would be accepted, and the work would in all probability be commenced in May.

WAYSIDE NOTES.

EMULATING the Norwich fathers, the citizens of Rochester had a mind to convert the keep of their historic castle into a museum. The forbidding pile of ruins that overshadows the Medway is, however, to remain as of yore—at least for the present. According to the *Athenæum* the proposal to establish the museum in the old building has been definitely withdrawn, so far as concerns the immediate future.

Replying to a question respecting the progress made with the plans for the completion of the South Kensington Museum, the First Commissioner of Works stated on Tuesday evening that the successful competitor, Mr. Aston Webb, has been engaged in making the alterations to the plans suggested by the Science and Art Department and the Office of Works. Considering the time required to make these alterations, to clear the site, and to make temporary arrangements to enable the department to carry on its work during the erection of the new buildings, it is not proposed to do more during the present year than complete these preliminary arrangements. So, in effect, said Mr. Plunket. Seeing that we have only commenced the year—roughly speaking—the department are going to do things with "measured tread and slow." Ten and a half months, at least, for preliminary operations, before even a brick is laid, is a liberal allowance of time, and should justify our expectations of ultimately seeing some very wonderful work indeed.

The First Commissioner of Works has also made a statement with regard to Mr. Henry Tate's offer in the matter of the erection of a gallery for British pictures. The Government are very anxiously considering the offer. Further information may be forthcoming if Mr. Whitmore repeats his question next week. It seems about time to hear of something definite. Cynical people say the Government is going out presently, and prefers to leave the task of providing these little luxuries to its successor.

That good old "hardy annual," the question of "Fogs in the Metropolis," occupied the attention of the House of Lords during the whole of their Friday's sitting. Viscount Midleton asked whether the Government were prepared to appoint a Royal Commission to inquire into the causes of the prevalence of fogs in London; to ascertain how far, and by what means, they were preventible; and to make such recommendations as, after inquiry, they might deem advisable. Fogs were on the increase. There were 1,500,000 private chimneys within the Metropolitan area; 480 tons of sulphur were daily admitted into the atmosphere. It had been shown by the Meteorological Society that the domestic chimney was responsible for nineteen-twentieths of all that portion of the London fog which consisted of smoke particles. The remedies suggested had been the use of anthracite coal, the adoption of smoke-consuming grates, and the introduction of some chemical apparatus into the chimney for the purpose of consuming the smoke.

The common-sense, practical tenor of Lord Salisbury's reply to Viscount Midleton will have struck many readers of Parliamentary reports. There could be little doubt that the fogs which arose from the Essex marshes came from the sea. The worst fog Lord Salisbury remembered was one of about four years ago at a sea-coast town, where a man could not see his own boots as he walked along the parade. The compulsory consumption of anthracite coal, as suggested by Professor Frankland, would be a remedy for the colouring of the mist-fog by the unconsumed carbon discharged from chimneys; but in this event the price of this class of coal would be enormously increased, the whole of the population would have to give up open grates, and it was doubtful if the people of London would condemn themselves and their children to sit by a flameless fire. Such a remedy would require a gigantic system of inspection. The burden thus entailed would be worse than any London fog. Lord Salisbury concluded by saying that the Government did not think it advisable to appoint a Royal Commission on the subject; but would heartily support the appointment of a committee.

No one wants to retain the London fog; but it is not difficult to see that time and efforts may be wasted on worse than futile attempts to remedy what is irremediable. Whatever is done with the smoke, fog, more or less dense, must remain. Whilst London stands in its present position—in a basin, adjoining extensive, damp marshes, and connected with a not-distant sea by a broad river—sea-fog and marsh-fog, or mist, must come. The chief benefit that would accrue from the absence of smoke would be that we should find our chests, throats, and noses more comfortable in a fog than when smarting with the irritation that, presumably, the carbon occasions. Though perhaps no less dense so far as seeing is concerned, benefit would certainly accrue from the easier transmission of light. The Egyptian darkness that now periodically overtakes us, even on a June day, would perhaps disappear. This would be a great gain. As to the actual presence of 480 tons of sulphur, &c., I always regard these materials as excellent deodorisers and antiseptics. Were there no vast clouds of floating particles of carbon occasionally passing over the Metropolis, we might find that our municipally-provided scent bottles—otherwise the street sewer-ventilating gratings—would be more than ever in evidence. I have a mind that the carbon in the London atmosphere does a deal of good work.

On Saturday we managed to get as far as Sydenham to see the electric show, and were highly pleased with the same. With a clear recollection of former exhibitions, the advances made since that day, in almost every department of electrical engineering, are very striking. Perhaps nothing is more noticeable and gratifying than the steadiness of the arc light. Whereas the older lamps twinkled like stars in the firmament, the glimpse of the many pendent lights ranged along the lengths of the Palace "nave" gave the effect of so many calm, placid moons, or the sort of night effect that might be imagined to reign on some remote planet even more lavishly provided with satellites than any of which we know. Certainly, to miss going to the Crystal Palace during the time of the electrical display should be culpable on the part of the architect. It is most instructive—when you can find the exhibitors ready and willing to instruct you.

Seeing the rapid studies made in the matter of electrical supply and the extensive operations of lighting companies about which you wrote last week, I suppose that architects have taken all necessary steps to inform themselves with regard to electric lighting, so far as it affects the specification and bill of quantities. Many who may have neglected the subject have an opportunity this evening of getting a fund of information in a short space of time. Mr. Max Clarke reads a paper at the Asssociation which I doubt not will contain abundant hints in artistic and practical matters connected with the electric-lighting of houses.

"Come to Venice!" said a friend. The thermometer was somewhere about freezing-point, while a blizzard raged in the streets, and I thought I would go to Venice, if possible as likely to prove a paradise by contrast. When I found that he meant "Venice at Olympia," I had to think twice, having heard about the chilly sea-breezes that blow over the lagoon; but then remembering reading something to the effect that the management had taken steps to warm the atmosphere, I consented to go direct by rail to the "Bride of the Sea," induced, I must say, chiefly by your recent notice of the glass-blowing at Dr. Salviati's furnaces. As it occurs in the "Ingoldsby Legends," "I would not have missed such a sight for a pound." I advise no one to miss it for the sixpence charged. The deftness of these true artists, the beauty of their work, and the picturesqueness of the whole scene are really, as the custodian at the entrance continually announces, "very interesting and well worth seeing." As for the rest of the show, "the town" is a pretty fancy; and, by the bye, I should advise you, Mr. Editor, to be cautious in accepting any "sketches of Venice" offered, unless the sketches be guaranteed by respectable parties, and holds a certificate from some authority at real Venice, stating that the sketches were made on the spot. Otherwise you may be deceived with sketches from Olympian Venice. I did see one young man sketching there, and kept sharply on the look-out for any members of the Association who might be making measured drawings with that frantic industry so noticeable at Saturday afternoon visits and summer excursions. Some people have complained of the lack of effect in the gondolas; but it seems to me that it is just in the graceful action of the gallant gondoliers that we get a true touch of the real Venice. The spectacular display is scrumptious, and not too much of it.

GOTH.

CHIPS.

On Saturday the Bishop of Southwell (Dr. Riddings) opened and dedicated the new mission church of St. Anne at Ambergate, near Belper, Derbyshire. The church, which is built of Ambergate stone, is in the Early English style, and is capable of seating upwards of 200 persons.

The concluding lecture of the very successful series organised in connection with the Glasgow Corporation Art Galleries was given on Saturday night to a crowded audience, by Mr. James Paterson, R.S.W., on the subject "A Talk about Landscape." Mr. Paterson said it had always been a cause of wonder to him that there had been such a terrible descent in the quality of British art in the period following Constable, Turner, and Thomson of Duddingston. He expressed belief, however, that landscape in this country had recently taken a most decided turn for the better, and that the outlook was certainly very bright.

A National Museum of Commerce and Industry is about to be created in Paris, and it is estimated that it will cost £80,000. The Paris Chamber of Commerce has agreed to supply half that sum, and the Minister of Commerce has undertaken to ask Parliament to furnish the remainder.

The contract for the construction of the new railway from Wrexham to Ellesmere to connect the Cambrian and the Wrexham and Connah's Quay and Manchester, Sheffield, and Lincolnshire, and the Cheshire Lines system, has been let to Messrs. Davies Bros., of Wrexham, the amount of whose tender was £90,000. There now remains one link to complete the chain of railways giving an alternative route from South Wales to Liverpool, Manchester, and the North—namely, from Hawarden-bridge to Mersey Tunnel. The work on the Wrexham and Ellesmere section is to be commenced almost immediately.

The college of Redruth has just been opened. It has been built from designs by Mr. James Hicks, of that town, the contractor being Mr. Arthur Carkeek, of the same place.

A memorial stained-glass window has been placed in the parish church of Largs, N.B. It is of four lights, and is occupied by subjects taken from the "Te Deum." Messrs. Stephen Adam and Co., St. Vincent-street, Glasgow, are the artists.

The Directors of the Manchester Royal Exchange have under consideration the question of the enlargement of the Exchange by removing the portico and extending the main floor as far as Cross-street, and have instructed their architect, Mr. Murgatroyd, of that city, to prepare plans and a specification, which will be laid before the proprietors at the annual meeting next month.

The gallery in Grafton-street, Euston-road, which threatens to become a formidable rival to the New Gallery, is making progress. Messrs. Wimperis and Arber are the architects.

A stained-glass window, the work of Messrs. Cottier and Co., of London, has been placed in the south transept of Holy Trinity Church, Leamington. The subject is "The Virtuous Woman."

The Midland Railway Company proposes to expend upon the construction of new lines and works, under powers sought this session, £1,275,649. This includes £418,932 which, it is computed, will be the cost of the proposed extensions of the Chapeltown branch from Ecclesfield *viâ* Wombwell and Ardsley, and from Wombwell to a junction with the line from Derby to Leeds. The length of these extensions is a little over ten miles, and the average cost per mile is about £39,000.

A memorial reredos has just been placed in Montgomery Church, from designs by Messrs. Carpenter and Ingelow, of London. The work, together with wings, new steps, and floor of marble and tiles, has been executed by Mr. Bowdler, of Shrewsbury. Mr. Earp, of London, carried out the carving.

The trustees of the National Gallery have accepted the bequest, by the late Mr. John Jame Lowndes, of Chelsea Embankment, of the rec chalk drawing made by Rossetti in 1871 for hi picture called "Rosa Triplex."

At a recent meeting of archdeacons and rura deans in the cathedral vestry, Newcastle, Mr Arthur B. Plummer (of the firm of Plummer an Burrell, architects, Newcastle) was appointed diocesan surveyor for Northumberland (Lindisfarne archdeaconry).

ARCHITECTURE AT THE ROYAL SCOTTISH ACADEMY.

THE architectural section of the exhibition is comprised in twenty-seven subjects, and does not bulk so largely as in former times. They are arranged in the south room, and mostly in good position; but two of their number have been crowded out, and are awkwardly placed in the passage between the rooms, to make way for oil-paintings, the pressure for the accommodation of the latter having not been less than in preceding years. There are several very fine examples of etching, which has of late become more popular, and evidence of this is naturally to be expected in the exhibition. 585, "How the Gossip Grew," is a humorous picture after F. D. Millet, etched by F. Heath. 596 is another etching, by W. Hole, R.S.A., after the same master, "La Bergère gardant son troupeau." Street architecture and mansion-houses make up the most interesting architectural examples. 481 is a good perspective drawing of a large and lofty tenement now being erected at the corner of the High-street and Cockburn-street by the National Bank. Mr. McLachlan, the architect, has made a most effective corner, which exhibits the characteristic features of the old Scotch style, with considerable variety of ornamental features in the proportions of the windows, and some Jacobean Classic details, giving it more architectural importance. The portion on the ground floor adapted for the business of the bank is easily picked out by the range of large and lofty windows. The entrance door is in the angle, and the difficulties of such a doorway have been successfully grappled with. At the eaves, the characteristic dormer gables, with an angular touch, have a good effect, and the whole is one of the best, as it is the most architectural, of any of the recent additions to the High-street. 527 is a beautifully executed drawing in line, like an engraving, of the entrance to the Caledonian Railway Station. This is now being erected, and the drawing is the geometric elevation merely. Messrs. Kinnear and Peddie, the architects, have provided a very handsome frontage of much dignity, and showing nice proportion in details of the three archways. The whole design is, indeed, too grand and massive for a mere verandah; but there may be some idea of preparing for future contingencies, when the sense of proportionate magnitude will be better satisfied. The roof of the entrance front is a very steep Mansard, and has an overpowering magnitude in the elevation, which, however, will disappear in the perspective. 543, "New Premises, Princes-street," for Redfern and Son, is a very elaborate design in the way of street architecture, by Mr. G. W. Browne, architect of the Free Library. Mr. Browne has to contend with the difficulties of a very narrow and lofty frontage, not to speak of the provoking contrast in proportions and details of the adjacent buildings. The drawing is a vigorous one, clearly exhibiting, to a pretty large scale, the details of the ornament, which are of a mixed character. The shop front has one large window and the doorway, the window formed by a low centred archivolt. There is much ingenuity in combining the modern style of decorative detail with samples of the Continental Flamboyant Gothic and the whole has a striking appearance and provides a very marked contrast to any of the alterations hitherto made upon the ever-changing aspect of the street. 406, "Design for Edinburgh Public Library," by J. G. Fairley, shows the George IV. Bridge, or principal frontage, elevation. The building is brought entirely forward to the street line, and so has the advantage over others which, to get more light below, made a part more or less deeply recessed. The drawing is well delineated, and exhibits a fair Classical frontage with symmetry of arrangement and well-proportioned windows and other features of the style. But the whole is overburdened with pilasters and pediment ornamentation too closely crowded together, and the frontage would have had a more pleasing appearance if this exuberance of detail could have been dispensed with. Mr. Fairley, in 493, sends a very fine water-colour sketch of "Additions to Kirkbrae House, Dean Bridge." The house is located at the south end of the bridge, and, as improved, will be a good addition to the picturesque locality. 541, "Brechin Free Public Library"—a selected design, by J. McLellan Fairley—is a modest building, without any very noticeable architectural detail. 537, "Students' Mission and Settlement Buildings," is a piece of street architecture in one of the poorish districts of the city. Mr. Kerr, the architect, has given the somewhat squalid neighbourhood a building of some dignity, and without any extravagance in ornamental details. The tenement is a lofty one, with some Gothic detail. It is finished at top with barge-boards and timber work; but the edifice, perhaps, is rather lofty for that cottage style, and the ordinary Scotch Gothic dormer would have looked as well, and more substantial. 540, "New Orphanage for Girls at Whiteinch, Glasgow," is a stately and substantial piece of architecture in the ordinary domestic style, by S. Henbest Capper. 492, "Competitive Design for Ayr Library," by G. W. Browne, is s street architecture front, with two very large oriel windows, but otherwise without architectural detail of noticeable mark. 502, "Duntreath Castle, Stirlingshire," by Messrs. Mitchell and Wilson, is a large picture of a subject illustrated from another point of view in the exhibition of last year. The castle is a very large one, and apparently covers a great extent of ground. The main characteristic of the design from this point of view of the picture is the grouping of the lower portions with two of much greater altitude, a somewhat formal arrangement, but securing the most picturesque effect with such an extended frontage. The building, though comparatively plain, has a fair display of the characteristic features of the Scotch style. 404, "Ferguslie Park, Paisley," is another very large mansion, designed by Mr. H. J. Blanc, of which some interior views were given in last year's exhibition. It is a compact design of many and lofty floors, in what may be called the ordinary domestic style of the best class, of cheerful aspect, with large and varied windows, and ornamental timber-work in the gables. 488, "Blair, Ayrshire," is an excellent etching in Prout's brown of one of the oldest inhabited houses in Scotland, with some alterations made recently by Mr. T. Leadbetter, architect. The oldest portion, as stated in the drawing, is the centre portion, and successive additions have been made by extending this frontage at each side, so that the aspect of the whole is now that of a very long and probably narrow edifice, without anything of the picturesque variety of projection often found in these old houses. The older and more modern portions exhibit the usual details of the Jacobean period, without any traces of machicolation in the ornamental detail of the upper stories. 517, "Fyvie Castle, Aberdeenshire," is a large and very beautiful water-colour drawing of one of the most peculiar specimens of the ancient Scottish Baronial castles. An addition has been recently made to the work by Messrs. D. and J. Bryce, and apparently without detriment to the character of the whole. One of the most important and interesting of the architectural exhibits is the interior view of the Parliament Hall, Edinburgh Castle (530), showing the dais, but giving at the same time a very good idea of the restoration. Mr. Blanc, the architect, sends also another interior sketch, to show the screen, in water-colour (542). Both are most elaborate drawings, and indeed the subjects require it for illustration. The chimney-piece is a massive structure, richly carved, and stands out in good relief from the lofty panelling, which is carried round the walls. The massive timbers of the roof and accessories are very well delineated. These show an amount of attention to minute details which will make this long-neglected interior one of the most interesting relics of the past, and an architectural masterpiece as well. The screen is still more highly elaborate in its construction, being in Decorated Gothic work. All the accessories of the interior have been studied to give the antique character essential to its restoration The hall, it is understood, will be used as an armoury, or other useful purpose, until Professor Blackie's Home Rule Parliament is summoned to meet within its walls. The churches of the collection are few. Mr. Blanc, in 482, sends a view of St. Matthew's Church, built two years ago for Morningside, as it will be when completed, by addition of its spire and chancel. 483 is a small drawing, rather too faint and far away from the eye to see any detail, but enough to indicate that it is one of the cheaper galleried churches. 490 is a more ambitious effort, by F. W. Simon—"Design for a Gothic Church of the Lancet Period." There is no novelty in the design, which appears to be that of an interior with nave and narrow passage aisles and transept, the tower and spire at one side of front gable, and staircase at the other. The point of view from which the picture is taken has been rather near, producing an unpleasant sharpness of the angle nearest the eye, and not doing justice to the range of lancet windows. The surface arcading is too continuous, and would have told better had there been rather less of it. Otherwise the design is in all respects a very well-proportioned study in this style. In 545, Mr. Simon gives a sketch of a new church at Manchester, erected in brick and terracotta. It is a piece of street architecture, and, no doubt, harmonises well with its surroundings. The details are all of simple character. 544 is a new Free Church erecting at Moffat, by D. B. Burnie. The etching shows the edifice in a very commanding position, open on every side, with much ornamental surface work, in doors and windows arcading. The principal front is flanked by a spire of moderate height on one side, and the usual gallery staircase at the other. It is plainly a galleried church, with double row of windows at the side, and a very shallow transeptal projection. The spire rises from a low tower, having the angles truncated for pinnacles on its upper stage, and the somewhat dropsical proportions of the body of the building are masked in front by the usual expedient. It will be observed that the collection above is by no means what it ought to be as representative of the architecture of the day. Were it not for a few constant contributors from Edinburgh itself, the exhibition would be nowhere. The new Council of the Academy may turn over a new leaf.

THE CLERKS OF WORKS' ASSOCIATION.

THE ninth annual dinner of this association was held at the Holborn Restaurant on Monday night, Mr. Aston Webb, F.R.I.B.A., in the chair. The toast of "The Architects and Surveyors" was proposed in a humorous strain by Mr. G. Dalton, who gave some reminiscences of his experience as a clerk of works. To this toast Mr. G. Stanley Peach, F.R.I.B.A., and Mr. Stanley Clarke responded. The chairman gave the toast of the evening, "The Clerks of Works' Association," mentioning that the association now numbered 130 members, being an increase of ten during the twelvemonth. He thought that something ought to be done in the shape of establishing a benevolent society, seeing the misfortunes and uncertainties which must necessarily attach to members following such a calling. Mr. Brady, the President of the Association, responded to the toast, and expressed himself highly gratified with the status of the association. Referring to the suggestion made by the chairman, he said the association was established as a purely professional and independent society, without the necessity for creating an insurance fund. Mr. F. Dashwood, secretary, proposed "The Worshipful Company of Carpenters," cordially thanking that guild for the assistance they had rendered the association. Professor Banister Fletcher responded. "The Health of the Hon. Treasurer" (Mr. J. Oldrid Scott) was heartily drunk, after which "The Visitors" was given, to which Mr. F. T. Baggallay responded. The toast of "The Chairman" was proposed by Mr. T. Edmond.

A monument has been erected by the Baroness Burdett-Coutts over the grave, in Brompton Cemetery, of the late Rev. Henry White, Chaplain of the Savoy. A marble bust of Mr. White, executed for the memorial committee by Mr. T. R. Essex, has recently been placed in the Art Gallery of the Corporation of London, at Guildhall.

Messrs. Ross and Son, the contractors for the Black Isle Railway, are making rapid progress with the work of construction, and the directors of the Highland Railway have now accepted tenders for the erection of the necessary station offices and other buildings at Redcastle, Allangrange, Munlochy, Avoch, and Fortrose.

Plans have been prepared by Mr. A. J. Sturges, architect, 4, High-street, Guildford, for a steam laundry at Guildford, for the Guildford Steam Laundry Company, Limited. The building will be situated close to the town, and will be fitted up with the latest appliances. Messrs. E. and A. Miles are the contractors. The works will commence next week. The main building measures 100ft. by 45ft.

COMPETITIONS.

Coxlodge Asylum Extension, Newcastle-on-Tyne.—The Asylum Committee of the Newcastle City Council met on Wednesday afternoon to receive the report of the assessor, Mr. George T. Hine, F.R.I.B.A, of Nottingham, as to the competitive designs for this important extension, which will provide 350 extra beds, a lecture-hall, chapel, resident officers' house and lodge, and is estimated to cost from £70,000 to £80,000. The competition was one under motto, and was confined to architects carrying on their profession in Newcastle, the architect awarded the first prize to have the commission for carrying out the work; the second plan, £150; the third, £100; and the fourth, £50. Mr. Hine stated in his report that 18 sets—with four alternative plans—making 22 in all—had been sent in, every one of which was highly creditable to the architectural abilities of the competitors. These plans had cost him—owing to their general excellence—a great deal of time and very much anxiety before he had been able to decide on the first four. Not one of them had fulfilled all the requirements of the Lunacy Commissioners, and the successful plan would require to have some little modification made in it. Several were out of court in consequence of the cost; but not one of these would have been in the competition independently of that fact. The successful competitors were, in his opinion, to be placed in the following order:—1st, Motto, "Norstan," Mr. J. W. Dyson, 18 Grainger-street; 2nd, "Compact," Messrs. Montgomery and Carr, 42, Grainger-street; 3rd, "Order," Mr. W. L. Newcombe, Pilgrim-street; 4th, "Northumbria" (second plan), Messrs. R. Knill Freeman and S. R. Robbins, Grainger-street. The committee did not come to any decision on the matter, but are to meet again shortly to further consider the assessor's report.

◆

CHIPS.

The Parliamentary estimates for the construction of the proposed underground railway from Waterloo Station to Mansion House-street have been deposited by the engineers, Messrs. Galbraith and Church and J. H. Greathead. The length of the line is 1 mile 4 furlongs 6·80 chains, and the total cost of construction is estimated at £499,769, or at the rate of about £333,178 per mile.

The Anstruther Harbour Commissioners provisionally adopted a plan submitted by Messrs. Stevenson, C.E., Edinburgh, extending the harbour 12½ acres by building extra piers to the south-west, and giving a depth of water of from 6ft. to 10ft. at low water, the sheltered deep-water area being 2½ acres, and the estimated cost £35,000.

A County Council inquiry, which took place at Mortlake on Monday and Tuesday in last week with respect to the application for the conversion of the Richmond rural sanitary district into an urban sanitary district, aroused much interest in the parishes affected. Though the total population of the district is only 18,864, there are at present in the four parishes—Barnes, Mortlake, Kew, and Petersham—three distinct authorities, and representatives of these bodies objected to the present scheme, but admitted that they aspired to some other form of local self-government than that at present possessed by them.

The picturesque old stone bridge spanning the river Beauly, in the Highlands, was washed away on Friday afternoon, being the third of the bridges designed by Telford, the celebrated engineer, which have been destroyed by the recent floods. Shortly before 5 o'clock it was inspected by the Messrs. Ross, contractors for the Aviemore and Black Isle railways, but in less than a quarter of an hour the two centre piers gave way, the width between each being 60ft. In consequence no road traffic can now be carried on between Inverness and Beauly.

The Emperor Frederick's sarcophagus, by the sculptor Begas, was placed over the vault in the mausoleum at Potsdam on Friday. It is of white marble, and weighs about 10 tons. The late Emperor is represented as clothed in a field marshal's uniform, and lying on the sarcophagus wrapped in his cloak, his hands holding his sword on his breast. The sides of the sarcophagus are adorned with reliefs.

Mr. John Price, of Grappenhall, superintendent engineer on the Manchester Ship Canal works, is about to sever his connection with that undertaking, having been appointed to the position of superintending the construction of the proposed new Lancashire, Derbyshire, and East Coast Railway.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—G. R. F.—M. and L. Co.—Frank.—M. W.—S. E. P. Co.—J. L. (Wimbledon).—Veritas.

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"Sector," "Alpal," "Isabel," "Pastime," "Peterborough" (no name and address), "Old Postage Stamp," "Athenian."

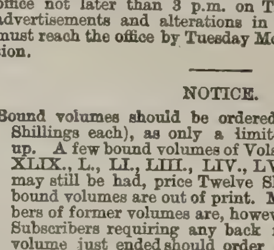
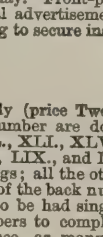
QUESTIONS.

[10720.]—**Quantity Surveying.**—Will some obliging quantity surveyor kindly say whether it is usual to take rough cut squint quoin lineal, in addition to rough cut raking face superficial, to splayed jambs of door or window openings?—Espere.

[10721.]—**Elliptical Arch.**—I intend to build an elliptical arch (in special blue brick with cement); at the centre of each crown there will be a principal weighing (with slates) five tons. Will any reader kindly inform me if this arch will be strong enough, giving formula for working out strength of same?—Carey.



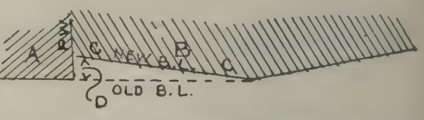
Elevation.



Section.

[10722.]—**Who is Responsible?**—A buys land and builds a house, his architect having drawn up the usual conditions of contract and agreement, making the builder responsible for any damages he may occasion to B's property adjoining. Who should B. sue or apply to in case such damages, if occasioned, are not rectified? Should it not be A, the owner, or could the architect have inserted a clause virtually conveying the land to the builder during erection of building, thus clearing the owner, and making the builder the owner for the time being? If this latter is the case, would it not necessitate a stamp being put on the agreement at the usual conveyancing rate of 10s. per cent.?—Lex.

[10723.]—**Party-Wall.**—A and B are separate properties with party-wall between; B pulls down his shop and re-erects his premises; the authorities require him to set back to line C C. Query: Has B sacrificed all his right to portion of ground that the party-wall stands on D, also right of usage of wall from ground upwards, as formerly occupied by his old buildings?—Twenty Years' Subscriber.



[10724.]—**Quantities.**—What is the professional charge for quantities when exceeding the 2½ per cent. rate? Who established the rate?—Surveyor.

[10725.]—**Church Planning.**—1. What is the cause of the chancels of so many old churches not being in the same line as the nave, but run off a little to one side—is it the fault of the setting out, or symbolical of the Crucifixion? 2. Can any of your readers tell me what was the old rule in setting out the fall of the nave floor? In one church I find it falls a few inches towards the chancel, in another a fall of 18in. towards the west door; again, the chancel one step down from the nave. What books will give me the information I require?—Edward Swales.

[10726.]—**Woodwork Interiors.**—Would some of your readers recommend a good work on the treatment of woodwork for interiors, suitable for study by a young draughtsman at present in the country.—Earnest.

[10727.]—**Portland Stone.**—Would any kind correspondent, with experience and knowledge of Portland stone, kindly inform a reader of many years which bed of Portland is intended by term in specification "the best brown Portland stone," evidently copied from an older specification? On looking up my Rivington's on Material, I find no Portland stone classed as brown.—Petro.

REPLIES.

[10715.]—**Technical Schools.**—There are technical schools in Marylebone, which may be seen at any time by applying to the attendant at the entrance, 64, High-street, Marylebone. They were completed last year, Mr. Thos. Harris being the architect.—Geo. F. Adam.

[10672 and 10719.]—**Salisbury Cathedral.**—The vaulting of the nave and aisles is thus described by Price, whose opportunities for examining the building were exceptional, while his observations are critical and exact: "The groins and principal ribs are of Chilmark stone, but the shell or vaulting between them is of hewn stone and chalk mixed, on top of which is laid a coat of mortar and rubble of a consistency probably ground in a kind of mill, and poured on hot while the lime was bubbling, because by this the whole is so cemented together as to become all of one entire substance." In another place he describes the vaulting as being 18in. thick; that of the Lady-chapel is of the same description. The slenderness of the Purbeck shafts in this chapel has often excited surprise and wonder at the architect's boldness. The dimensions of the east window quoted from Rosengarten are entirely erroneous. The east windows of the Lady-chapel consist of a central lancet of three lights, the middle one higher than the sides, and a single lancet to each aisle. The stonework of the spire is 2ft. thick at the bottom, diminishing to 8in. near the top. I regret that I can give no information as to the jointing of it.—J. H.

◆

The ventilation of Westmill parish church, Buntingford, has been intrusted to Messrs. Baird, Thompson and Co., ventilating engineers, London and Glasgow, who have introduced their "Æolus" invisible or concealed self-acting roof ventilators for the extraction of the vitiated air, and their "Æolus" improved waterproof air-inlet ventilators for the admission of a pure supply of fresh air.

The work of building new quarters for married troops stationed at Devonport has been commenced by local contractors, and about 100 men will be employed for nearly a year. Fifty-four houses are to be built accommodating a similar number of families, and the cost has been estimated at £5,500.

A company has been formed at Ashford in Kent for the purpose of establishing a bacon factory there. Mr. Henry J. Jeffery, M.S.A., architect, of that town, has been engaged to prepare the necessary plans and superintend the erection of the new buildings. The engineering portion of the work is intrusted to Mr. Edward W. Maundrell, engineer, of Calne, Wiltshire.

A social gathering of the members of the Leeds and Yorkshire Architectural Society was held last Monday evening at the Law Institute, Albion-place. Those who attended were invited to inspect a collection of drawings and sketches of architectural subjects. Mr. Frank Bedford showed a collection of sketches of Italian and Spanish architecture, Mr. E. J. Dodshun some pen-and-ink sketches of Domestic work in Shropshire and Northamptonshire, and other sketches of interest were shown by Mr. W. J. Mettam and Mr. Carby Hall, hon. sec. The members were further interested in some ingenious specimens of wood and ivory turning exhibited by Mr. H. B. Buckley.

A theatre, which has been erected in Upper High-street, Wednesbury, from designs prepared by Messrs. Joynson Brothers, at a cost of £5,000, was opened on Monday week. The building is seated for upwards of one thousand persons.

Legal.

THE RATING OF HOUSE OWNERS.

IT is often important that those who have to deal with small properties should advise their clients clearly and certainly upon questions of rating. Of course, the general rule is for the occupier to pay the rates; and when the owner does pay he reckons it in the rent. But there are cases in which an owner must either enter into an agreement with the overseers to pay the rates, or find that he has himself been rated by them without any such arrangement. There are so many statutes affecting all these questions of rating, some of which are wholly, and some only partially, repealed, that it is very satisfactory to find a Divisional Court deciding as it did in the recent case of the overseers of West Ham (*Times*, 8th February), that this rating of owners of houses instead of occupiers is now regulated by one statute only. This is the Small Tenements Acts 1869 (32 and 33 Vic. c. 41), and this alone need now be considered. The overseers had tried to assess the owners in question under some earlier Act which gave them greater powers and better terms, but the Court held they were wrong, and distinctly laid it down that this Act alone now governs all these matters.

The statute applies to all property in England and Wales. It affects the owners of property of the rateable value of not exceeding £20 in the Metropolis, or £12 in Liverpool, or £10 in Manchester or Birmingham, or £8 elsewhere. These limits varying with the localities are fixed to include the same average class of property throughout the country. In order to protect the parishes from the loss of rates if they were bound to assess the occupiers only, the statute gives two methods by which owners may be made liable. One is by agreement between owners and overseers. It is provided that owners of such properties may arrange with the vestry to be rated to the poor, instead of the occupiers; and in this case the overseers are to allow the owners a discount or deduction not exceeding 25 per cent. of the rateable value. Such agreements are very common, and the allowance varies with the circumstances. To protect parishes where owners will not so agree, the vestry are enabled in regard to these small properties to order that the owners shall be rated to the poor instead of the occupiers. But if they do so they must allow the owner a deduction of 15 per cent. in his favour upon the rateable value of the property. These rules are now declared to be the only ones applicable to the rating of owners, and under these it is generally found that an owner can get better terms by agreeing with the vestry than by waiting to be rated by their order.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning, to insure answer same week.

X.Y.—BUILDER.—REPAIRS.—FIRE.—In the absence of any agreement, the builder doing repairs which are destroyed or damaged by fire will have to do them over again; and so, if careful, he should insure against this risk. Both owner and builder run a risk in repairs to buildings, and they should always arrange about the insurance.

S. S.—CONTRACT.—EXTRAS.—ARBITRATION.—If the contract is clearly drawn up and your certificate made final, there should be no power to arbitrate, as there could be no dispute; at all events, until after the certificate is given. You should therefore refuse a certificate until the defects are made good, and deny that there is any dispute upon which to arbitrate. I do not then see how the contractor can do anything.

◆

The Royal Edinburgh hospital for sick children is about to be pulled down and rebuilt on its present site. The new building will contain 100 beds, and has been designed by Mr. G. Washington Browne, of Edinburgh.

Two life-sized studies of lions made by Sir Edwin Landseer for the bronze statues at the base of the Nelson Column will shortly be placed in the British section of the National Gallery. They are the gifts to the nation of Mr. Hills, Landseer's old friend and business manager, whose death was recorded some little time ago.

WATER SUPPLY AND SANITARY MATTERS.

HAUXLEY AND TOGSTON.—After many preliminary investigations, including a Local Government Board inquiry held by Colonel Hasted, R.E., last August, the necessary works for the new water supply for the five pit villages of Radcliffe Terrace, Hauxley, Link Houses, Togston Village, and Togston Terrace have at length been commenced under the auspices of the Alnwick Rural Sanitary Authority. The scheme consists of the conveyance of spring water from Sturton Grange, that has hitherto been allowed to run to waste into the nearest burn, to the villages mentioned, where it will supply a population of about 1,600 persons, who have hitherto been without any adequate supply. Over eight miles of 4in. and 3in. cast-iron socket-pipes are being laid down between the source and the houses to be supplied, including the lengths of the various branches from the trunk main. The principal spring yields 21 gallons per minute in all seasons. Mr. John Carrick, of Durham, is the contractor, and the plans and working details have been prepared by Mr. M. Temple Wilson, the surveyor.

◆

LEGAL INTELLIGENCE.

THE FATAL FIRE AT BATTERSEA.—The inquest in this case, which has dragged through eight wearisome sittings, reached its last stage yesterday (Thursday). The coroner, Mr. Braxton Hicks, in summing up, defended his action in making so searching an inquiry, remarking that there were many points to be settled, amongst which were the delay in getting water, the construction of the building, and the rapid collapse of the building after the place was once on fire. As to the first point, he had, with the jury, tested the pressure of the water without giving the company notice, and found that there was sufficient force to send a jet over the chimneys of a house. The reason of the delay in obtaining water was found to be that a split wooden plug had got jammed. Since the fire occurred better provision of hydrants had been made in the district. Looking at the way in which the windows were dressed, and the construction of the building, the coroner thought it was a "piece of great callousness, or want of forethought or care" on the part of Mr. Minnis that he should allow naked gas lights to be used. Passing on to explain the construction, the coroner pointed out that the Metropolitan Building Act appeared to be very faulty. He was surprised to find how few the real offences against the Building Act were. The only offences that the experts referred to which the district surveyor could have taken cognisance of were the omission of a post under the bressummer, and the cutting away of the chimney breasts. The use of matchboarding when it reached the ceiling, and also when it was used on ceilings, was strongly to be condemned. Ironwork, also, ought not to be cased in matchboarding, but in some fire-resisting material. The Building Act provided for that in the case of public buildings and theatres, but not in private houses. The district surveyor would have no power to interfere until the work was finished, unless it came within the powers of the Building Act. Then a magistrate had to be asked to condemn the building as dangerous; but it was very seldom they did so. It was no offence against the Building Act for a builder not to give notice of alterations or send in plans; but he (the coroner) suggested that it ought to be made penal if a builder failed to do so. The inquest was still proceeding when we went to press.

IN RE G. POTTER.—The first meeting of the creditors of George Potter, of East Bond-street, Liecester, builder and carpenter, was called on Friday. The liabilities amounted to £213 0s. 11d., and the assets to £68, leaving a deficiency of £145 0s. 11d. The debtor said his failure was caused by loss by a contract to build two houses at Enderby, illness, and being out of employment. The Official Receiver reported that debtor was adjudged bankrupt on a creditor's petition on the 27th day of November, 1889, and had not received his discharge in that case. Since the date of the first petition the debtor has undergone a term of ten months' imprisonment for offences under the Debtors Act, 1869, upon the expiration of which he went into business again as a builder.

IN RE R. T. HOOKWAY, OF BIDEFORD.—A bankruptcy motion in the matter of Robert Taylor Hookway came before Judge Paterson at the Barnstaple County Court, on Friday, the debtor applying for his discharge. The bankrupt, an architect and builder of Bideford, according to the report of the Official Receiver, had the receiving order made on his own petition in June, 1891. The debtor estimated his liabilities at £1,531 11s.; but such liabilities actually amounted to £4,040 8s. 1d. The assets, which had been estimated by the debtor to realise £5,057 14s. 10d., were expected to realise only £659 10s. 1d. The debtor commenced business thirty-one years ago with a capital of £200. He was the owner of a large number of houses, many of which he had himself built. These were mortgaged to the amount of over £16,000. The value set upon them was over £20,000. It was also alleged that he had contracted debts without any reasonable hope of being able to pay them, and that he had engaged in hazardous building speculations. His Honour gave the debtor his immediate discharge, with the order that he pays to his creditors a sum of £200. This was agreed to.

APPEALS AGAINST COMPENSATION AWARDS.—EX PARTE STEVENSON.—In the Queen's Bench Division on Monday, Lord Coleridge and Mr. Justice Cave heard an application as to whether there is an appeal from an order of a Judge at Chambers refusing or allowing an appeal against an award of compensation to owners of house property under the Housing of the Working Classes Act of 1890. That Act makes provision for the ascertainment of the amount of compensation by award or certificate, and then it is provided that there may be an appeal on three classes of cases, the first of which is where the party named in any certificate of the amount of compensation ascertained by any award under the Act is dissatisfied with the amount and it exceeds £1,000. The party dissatisfied it is provided may, upon obtaining leave of the High Court, submit the question of the proper amount of compensation to a jury. In the present case, in which the owners of some house property in Manchester dealt with under the Act had obtained an award of £3,800 for compensation and were dissatisfied with the amount, and had applied to Judge at Chambers for leave to appeal and the leave had been refused, they desired to appeal against that refusal. The Court unanimously came to the conclusion that no such appeal lay, and the appeal was accordingly dismissed with costs.

COMPENSATION FOR INSANITARY PROPERTY.—GOUGH V. THE MAYOR AND CORPORATION OF LIVERPOOL.—Lords Justices Lindley and Kay, on Saturday, resumed the hearing of the appeal of the claimant in this case, from the order of the Divisional Court of the 22nd January last, dismissing his application to refer back the arbitrator's award, made upon the question of the compensation to be paid in respect of labourers' dwellings condemned as unfit for human habitation. The matter had once before gone back to the arbitrator, Mr. Hunter Rodwell (since deceased), after decisions of a Divisional Court and the Court of Appeal, and as the arbitrator had died since making his amended award it was admitted that if the Lords Justices now allowed the appeal they would have no alternative but to set aside the award. The case was reported in our issue of Jan. 29 last, p. 193. In the special case stated by the arbitrator in his first award he mentioned that the claimant put the value of the property at £728, while the respondents' witnesses, valuing it with regard to the presentment of the grand jury that it was unfit for habitation, estimated it at £283 and £247, but admitted that if the property was to be valued as fit for habitation and not in a condition prejudicial to health the compensation should be £667. Taking the view that he was bound to value the houses as condemned, he took into account the value of this land as vacant, and the value of the bricks and mortar, and awarded £300. The Divisional Court, however, thought the amount should be £667, and gave judgment for that amount; but there was an appeal from that decision, with the result that the Lords Justices sent the matter back to the arbitrator with directions as to the principles on which he ought to proceed. With that guidance he made an amended award of £468, which the claimant now desired to have reviewed on the ground that, having regard to the estimate of the witnesses for the corporation, the arbitrator must have taken an erroneous view of the principles on which he ought to have proceeded. The appeal was dismissed with costs.

IMPORTANT RIVERS POLLUTION CASE.—KIRKHEATON LOCAL BOARD V. AINLEY.—In Queen's Bench Division on the 11th inst., Mr. Justice Lawrance and Mr. Justice Wright heard a case of importance, deciding that a person permitting the drains of his premises to drain into a natural watercourse, which has become a sewer under the Public Health Act and which sewer pollutes a stream, is not to be deemed to be a person polluting the stream within the Rivers Pollution Prevention Act. It was an appeal from the order of the County Court Judge of Yorkshire, sitting at Huddersfield, directing the defendants to stop the flow of sewage from their works. The plaintiffs are the Local Board for Kirkheaton, and the defendants Messrs. Ainley and Co., of Shop-lane Mills, manufacturers. The plaintiffs took proceedings against the defendants in the County Court under the Rivers Pollution Act, claiming an order on the defendants to abstain from committing an offence. The ground of appeal was that if any sewage matter did flow into the stream it was carried along a channel used for the purposes of a sewer; that any sewage matter passing into the said stream from the defendants' premises so passed with the sanction of the plaintiffs. The following cases were referred to:—"Eden *v.* Levy," "R. *v.* Staines Local Board," "Ogilvie *v.* Blything Sanitary Authority," "Ainley *v.* Kirkheaton Local Board," "Glossip *v.* Isleworth Local Board," "Provost of Portobello *v.* Edinburgh." Mr. Justice Lawrance, in giving judgment, said the County Court Judge was wrong. The facts were shortly these—that many water-closets on the premises of the defendants communicated with two sewers, originally natural watercourses. The defendants, acting within their rights, drained into these sewers, which fell into the stream. The County Court Judge held that under Section 3 of the Rivers Pollution Prevention Act, 1876, the defendants were guilty. In that he was wrong. The defendants were not the persons who came within the section as the offending parties. Mr. Justice Wright concurred.

Covenants as to Height of Buildings.—Cooke v. Gilbert.—Mr. Justice North heard, last week, a motion to restrain the defendants from erecting on the Cathedral site, Ashley-gardens, Westminster, any building (other than an ecclesiastical building) of a greater height than 75ft., in breach of a covenant by Cardinal Manning, the defendant the Very Rev. Daniel Gilbert, and the defendant the Very Rev. James Bamber. The plaintiffs were the owners of certain houses, part of Ashley-gardens, and the occupier of one of them. The site in question was conveyed in fee in the year 1884 to Cardinal Manning and the two first-named defendants. By that deed the grantees covenanted that (if they should not require the site for a cathedral) neither they, their heirs, nor assigns would erect thereon any building of a greater height than 75ft. measured up to the ridge of the roof. In October last Cardinal Manning and his co-owners agreed with certain people, now represented by the Victoria Panorama Company, to allow them the use of the land for 3¼ years, for the purpose of a panorama. It was then stipulated that the occupiers should not erect any building of a greater height than 75ft. on the site. The company had commenced to set up a large polygonal building with sides 55ft. high, and a roof sloping back at a low angle to a "ring" about 83ft. from the floor. On this ring it was intended to erect a cupola. The sides had already been put up, and a greater portion of the framework of the roof, and some of the innermost principals, intended to support the ring with the cupola at the top of it. The company were now willing to give an undertaking not to put on the cupola pending the trial of the action, if they were allowed to complete the building up to the ring. His lordship said he should allow them to go on putting the covering to the skeleton roof up to the iron ring, but, of course, without prejudice.

Building on the Wrong Site.—Martin v. Booth and Another.—Mr. Justice Vaughan Williams and a jury had, on Tuesday, an action brought by Mr. Arthur Martin, of High-street, Battersea, a builder, against "General" Booth, of the Salvation Army, and an architect, Mr. W. Gilbee Scott, for damages. A year ago the Salvation Army were desirous of erecting a citadel at Tottenham. The plaintiff's tender for the building was accepted and a contract entered into. When the plaintiff commenced to mark out the ground for the building he discovered that the block plan was not accurate, and accordingly he saw a Mr. Gordon, who, the plaintiff alleged, was authorised to act on behalf of the defendants. Mr. Gordon told the plaintiff to go on with the work; but on March 25 the work was stopped, as it was discovered that the building was being erected in the wrong place, and partly on land not belonging to the Salvation Army. The plaintiff then refused to erect the building in the correct position as pointed out by the architect unless he was first paid for the work which he had done in error. Accordingly the Salvation Army employed another builder to erect the citadel, and the plaintiff commenced this action for damages for not allowing him to proceed with the building as shown in the block plan. The plaintiff having been called, at the suggestion of the learned Judge, the parties conferred, and by consent judgment was given for the defendants without costs, General Booth agreeing to pay £100 to the plaintiff in full satisfaction of all claims between the parties arising out of this action or otherwise.

PARLIAMENTARY NOTES.

South Kensington Museum Exterior.—In answer to Mr. Bartley, on Tuesday, Mr. Plunket said: During the autumn Mr. Aston Webb, the successful architect, has been at work on the plans, making such alterations in the details of arrangements as have been suggested by the Science and Art Department and H.M. Office of Works. Some time will be required for completion of working drawings, and for certain preliminary works necessary to clear the site, and to provide for the work of the Science and Art Department proceeding without interruption during the progress of the works; and in these circumstances it is not proposed to do more this year than carry out these preliminary works.

* * *

Sir John Coode is one of the three members elected this year by the Athenæum Club in recognition of their "distinguished eminence in public services."

Our Office Table.

The London County Council have before them two alternative schemes for improved communication between Holborn to the Strand. The scheme adopted by the Improvements Committee, on the recommendation of the late and the present engineer to the Council, is for the formation of a new street 90ft. wide from the Holborn end of Little Queen-street, passing between the Freemasons' Tavern and the Sardinian-street electric-lighting station, intersecting Great Wild, Vere, and Stanhope streets, to the point where Drury-lane is crossed by White Hart-street and Blackmore-street, and then proceeding in a south-west direction to the Strand, which it reaches at the east end of Catherine-street. The alternative scheme, brought forward by Mr. Maule, is for a street from Theobald's-road and Holborn, with a bifurcated entrance to the Strand, the new thoroughfare being λ-shaped on plan and possessing the merit of utilising the west side of Lincoln's Inn-fields. This project begins at Vernon-place, Bloomsbury, where it opens in Theobald's-road, and takes a course through Kingsgate-street, across Holborn, and then through New Turnstile into Lincoln's Inn-fields. At the south-western corner of the Fields a western spur is cut in a direct line to the junction of the Strand with Catherine-street, and an eastern spur passes along Clement's Inn to the Strand at the west end of the Law Courts.

The annual exhibition of the Manchester Academy of Fine Arts was opened on Wednesday. The selection is a smaller one than in most recent years, only covering the walls of three of the first-floor rooms at the City Art Gallery, but is thoroughly representative of the Manchester school. The place of honour in the first gallery is given to F. W. Jackson's fishing scene, "Ready to Haul." Among the best works are Joseph Knight's "Cotter's Field," and Mary Breakell's "Little Nell"; while in the water-colour room good works are the Venetian scene by W. H. Littlewood, "On the Grand Canal," and the study of a birch-tree, entitled "The Queen of the Common," by Byrom Cooper. The best portrait is the presentation one of Alderman Hinchcliffe by W. H. Johnston.

The bill which Mr. Lees Knowles has introduced for the registration of plumbers proposes that the work of examination and registration shall be in the hands of, first, a Grand Central Council; secondly, the Plumbers' Company; and thirdly, of local councils. The actual work of examination would be undertaken by the Plumbers' Company, but the Central Council would have important duties, and would be a body of very strong *personnel*, consisting of representatives of employers and workmen, of the Plumbers' Company, of different medical and sanitary authorities, and of the Institution of Civil Engineers, and of the Royal Institute of British Architects. The Bill does not affect the rights of non-registered plumbers, but it prohibits such plumbers from representing themselves to be registered.

Mr. Alexander W. Conquest, borough surveyor of Folkestone, died last week from blood-poisoning following influenza, after submitting to the operation of amputation of the lower part of the right leg. He was formerly borough surveyor of Ramsgate, and relinquished that post in March, 1880, on being appointed to a similar position at Folkestone from a list of 175 applicants. He was a pupil of the late Sir Joseph Bazalgette, and had just completed his 43rd year. He leaves a widow and five children.

Mr. M. H. Blanchard, formerly of 74, Blackfriars-road, London, terracotta manufacturer, died Feb. 1st, 1892, at his residence, Bishops Waltham, Hants, after three days' illness of influenza. He was one of the earliest revivalists of terracotta, and obtained the prize medal at the 1851 Exhibition for material and workmanship in terracotta. He carried out some most extensive terracotta works throughout the country, amongst them the South Kensington Museum, the Horticultural Gardens, &c., and was well patronised by the nobility and gentry. Mr. M. H. Blanchard's last improvement was a terracotta staircase and floor, and the same was tested by fire on Dec. 17, 1891. He was born Nov. 9, 1816, and buried Feb. 5, 1892, at Norwood cemetery. Mr. M. H. Blanchard was a member of the Society of Arts, having been elected Jan. 28 1863, also a member of the National Conservative Club, Pall Mall, W.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. Papers on "Stained Glass," by R. H. Carpenter, J. Powell, N. H. J. Westlake, and C. Heaton. 8 p.m.

Tuesday.—Society of Architects. "Are Amendments in the London Building Laws Desirable?" by Ellis Marsland, St. James's Hall, Piccadilly. 8 p.m.

Society of Arts. "Artistic Treatment of Jewelry," by J. W. Tonks. 8 p.m.

Institution of Civil Engineers. "Bishop Rock Lighthouse," by W. T. Douglass; and "Gas Illumination at Tory Island Lighthouse," by D. C. Salmond. 8 p.m.

Wednesday.—Society of Arts. "Ancient and Modern Art Pottery of Japan," by Ernest Hart. 8 p.m.

Friday.—A.A. Lyric Club. Fifth Concert at the Mona Hotel, Henrietta-street, W.C.

Royal Institution. "Optical Projection," by Sir David Salomons. 9 p.m.

CHIPS.

Among the adjudications in bankruptcy in Friday's *Gazette* the name appears of Henry Stopes, of Queen-street, Cheapside, late of the Hop Exchange, Southwark, brewers' architect and engineer.

The members of the West Suffolk County Council have decided to commission Professor Herkomer, R.A., to paint a subscription portrait of Col. Barnardiston, their chairman for the three years of existence just completed, to be hung in the Shire-hall at Bury St. Edmund's.

"Tewkesbury and its Abbey" formed the subject of a lecture delivered on Thursday night in last week by Mr. J. Godwin Perry, before the members of the York Architectural Association, Mr. Arthur Pollard, the president, presiding. The lecture was illustrated by lantern views.

At the last meeting of the town council of Ipswich, a committee reported that the Mayor (Mr. D. Ford Goddard) had offered to provide at his own expense a shelter for cabmen at the Cornhill. The designs and plans had been prepared by Mr. J. Shewell Corder, architect, of that town, and reproduced the old Market Cross demolished in 1812. The plan, site, and design were approved of, and the proffered gift was accepted with thanks.

As a nucleus of a suggested museum for Rochdale, Mr. James Ogden, of that town, has offered to give the whole of his curiosities, *bric-à brac*, and pictures, with a house in Kilmerdeyne-terrace as a curator's residence, and the sum of £1,000 towards the maintenance of the institution.

Mr. Henry Davis died at his residence, Billetfield, Taunton, on Monday week, at the age of 80. Mr. Davis had in his day been a church builder of high reputation, but he retired from business some years ago on account of old age. Among the works which he carried out were the rebuilding of the tower of St. Mary Magdalene, Taunton, the erection of St. John's Church, Taunton, and of the church of Buckland St. Mary, which has been described as a miniature cathedral. He also constructed a number of houses in the town of Taunton and neighbourhood. He leaves a widow, five sons, and two daughters.

Mr. Thomas Ingram, of 10, Staddon-terrace, Plymouth, celebrated his 100th birthday on Friday. Born in the city of Ely on February 10, 1792, he entered H.M. Board of Works Department, Whitehall and Somerset House, as a civil engineer in 1813, remaining until 1846, when he was transferred to Plymouth. He retired from the service in 1859.

A new reredos has been placed in St. Clement's Church, Salford, as a monument. The central feature is the Crucifixion, and the work has been carried out by Messrs. Doulton, of Lambeth.

The new church at Heap Bridge, near Bury, Lancashire, will be consecrated on March 2 by the Bishop of Manchester. The structure is a one-aisle church, and has been erected at a cost of about £2,000. It is in the Late Decorated style, and is built on an eminence in the midst of the village. It is fitted up with pitch-pine seats, and will find accommodation for about 350 persons. Mr. John Lowe, of Manchester, is the architect.

Wycliffe Congregational Chapel, Stoke-next-Devonport, was reopened the other day, after renovation, at a cost of £800. The building is Gothic in style, and was built in 1856.

The contractors for the river Cart improvements have lodged a claim for £25,000 against the Paisley Cart Trustees for work done beyond that contracted for.

WHAT IS "SUPERINTENDENCE"?

WHEN one man agrees to sell, and another to buy, some particular thing—no matter whether the thing be materials, labour, or professional skill—it is of the utmost importance that both should agree clearly as to what it is that is being bought and sold. If the seller is intending to supply one kind of thing, and if the buyer is expecting to get a different kind, there is every prospect of an ultimate dispute; and this being the case, the only wonder is that architects are not perpetually involved in disputes with their clients. For when an architect undertakes to superintend a building, and his client undertakes to pay him for so doing, it commonly happens that they use the word "superintendence" in two entirely different senses.

No client would say in so many words that he expected his architect to be omniscient and omnipresent. But this, in many cases, is what it practically comes to, and some recent cases in the Law Courts show that juries are disposed to be equally exacting. A builder, for instance, on his own responsibility, omits something in the contract which he considers needless. In course of time the architect discovers the omission. It would then be difficult to insert the work, and, thinking that its absence will do little harm, he contents himself with deducting the value when the accounts are made up. Now, if the building had failed, partially or entirely, because of this omission, it is reasonable that the owner should hold his architect responsible. But when no failure had occurred, and no injury was shown, it is rather hard that he should be able to recover substantial damages from him. If an architect is to have no power of modifying his work as it proceeds, he is reduced to the level of a clerk of works. It is of no use for him to watch it as it grows up; if it promises at some point to be too weak, he must not strengthen it, and if at another point it proves needlessly costly, he must not save the unnecessary expense. And it may prove either the one or the other without the slightest reason for blaming his original scheme. Nobody can tell, for instance, how every bit of a foundation will turn out before the trenches are excavated. Prudence may originally have dictated the provision of a solid bed of concrete below all the footings. But, suppose the excavation proves that the greater part of them will rest on a thick, iron-bound bed of gravel? Must the architect still dig this away in order to insert, at heavy expense, a stratum of concrete no stronger than the gravel itself? Some recent cases seem to show that he must. For if he tries to avoid this absurd waste of money, and so to benefit the building owner to the extent of scores or hundreds of pounds, that person (we cannot say that gentleman) may turn round on him at the close, and recover an additional sum from him as a punishment for having secured him a very considerable saving.

In much smaller matters again, the architect's and the client's ideas of superintendence differ. If the walls are specified to be of the best stock bricks, the client thinks that his architect must so look after the building that there shall not be a single place brick worked in, even in the centre of the thickest mass of brickwork. If the cement is to be of a certain weight and strength, he thinks the architect must take care that not a trowelful is anywhere used which is weaker or lighter. If the timber is to be free from dead knots, there must not be a dead knot discoverable anywhere from ground to ridge-piece; and so with other things. No doubt the architect will do his best to attain such a result. But if he could attain it by his own unaided efforts no clerk of works would ever be required. And general experience shows that in buildings of any magnitude, the services of a clerk of works are indispensable. If they were not—if it were really practicable for an architect to exercise the minute and microscopic superintendence which many people expect from him—is it likely that those very people would be ready to pay three or four guineas per week for supplementary inspection?

The sort of universal oversight which many persons look for from their architect could only be given if he were at the building and the builder's workshops from the first thing in the morning to the last thing at night. He must only have one building in hand at once, and he must give his whole time to it. This, no doubt, is what many of us would like very well, if the building were only large enough. But experience shows that the most exacting clients are nearly always those who put up the smallest buildings. If an architect carries out a £20,000 church or a £50,000 town hall, everybody, as a rule, is pleased; but let him have a £500 villa to erect, and the case will be very different. The owner who will pay him in all £25 for commission, thinks or acts as if he thought that for this £25 he ought to have the architect's entire services as long as the building is in hand. The drawings must be made in a week, and other clients, who are going to spend thousands instead of hundreds, must wait till they *are* made. The tenders must be received in open competition, so that the villa-owner may get the very lowest one possible. When they come in, the very lowest is what he accepts, no matter how doubtful the reputation or how embarassing the circumstances of the man who sends it. "I take what tender I please," he says, "and it is my architect's business to see that the work is done properly." Yet the man who says this would not buy for his carriage a jibber or a buck-jumper or a broken-down screw, and then say "I buy what horses I please, and it is my coachman's business to see that they go properly." He knows more about driving than he does about building, and he knows, too, that his coachman will not put up with too much nonsense.

The sum of the matter seems to be—that both the architect and the client should interpret their mutual agreement in a reasonable way. The architect should do his best to have the building contract honestly carried out in every respect. And he should so draw up the conditions of the contract that the builder shall be liable to make good departures from it at whatever period they may be discovered—no matter whether a final certificate has or has not been given. Further than this, it should be provided that if any departure from the contract should be of a kind which is practically beyond remedy, the difference between the actual value of the building so erected and that which the contractor undertook to erect, shall be ascertained and deducted from his balance or recovered from him. The faults in question originate with the builder, and the builder, who alone profits by them, should certainly be the man to pay for them. It is hardly necessary to say that the faults here spoken of do not include unavoidable errors, into which a builder may fall if the architect neglects to supply him with proper drawings and directions. Here, no doubt, the architect would be to blame. But to hold the architect responsible for a bit of scamped work and to let the builder go harmless, is like prosecuting a policeman for not preventing a burglary, and discharging the burglar on the ground that the policeman ought to have stopped him. Policemen are paid to prevent burglaries, it is true, and architects are partly paid to prevent the scamping of work—and both should do their best. But neither the architect nor the policeman can be everywhere at once, and the first people to come down upon are plainly the burglar and the scamper.

But if the law in its wisdom, and the juryman with his native intelligence, do not take this view, it is quite time that architects, for their own preservation, should make it clear that it is the view they hold; and more than that, the condition on which their services are given. Their fatal weakness in our day, and for some generations past, has been that of attempting too much and promising too much. A painstaking architect and a reasonable client will work satisfactorily together, even as it is. But to protect architects against clients who are not reasonable, and not less, to protect clients against architects who are not painstaking, there should certainly be issued by authority a clear and definite statement of what architectural superintendence really ought to be. We commend the matter to the attention of the societies which represent the profession.

◆

INTERIORS.

THE general verdict of the public on entering many of our great public buildings is one of disappointment. Either an excess of lavish ornament on the exterior, or of magnificent proportions and features, produces a sense of disappointment directly we enter. The expectation has been unduly raised by the façade or by the external features, and at once suffers a defeat on a view of the interior. That this is bad architectural generalship is not to be denied, for the aim of all art is to reveal unexpected pleasure, to lead up to a climax. But, we suppose, in architecture, as in all other things, immediate impressions are desirable; that there is a kind of good advertisement in a grand or imposing exterior, and even if it does not lead to something imposing internally, it is better than a poor impression on the outside beholder. A *coup de main* on the public eye at first sight is of more value than a surprise to the few who enter the building. We cannot wonder, then, if architects have been more partial to external displays, if, in spite of all moralising about clap-trap and outside show, there is a natural desire to captivate by those strokes of art which appeal to the greater number.

It may be of service if we point out a few of the causes which operate to diminish the effect of interiors and produce a sense of disappointment or disagreeable surprise. We all can appreciate a well-planned and executed action in a drama or in a musical composition, and we expect to see the same evidence in a building. Instead of which, if we find the interior is destitute of orderly arrangement, the entrances to chief apartments are placed in out-of-the-way and awkward corners, the corridors badly lighted and bewildering, our expectations receive a shock. We look forward and anticipate some grand hall, instead of which we enter a meagre corridor; there is nothing to carry on the imagination or the scale of the exterior. The *dénouement* disappoints.

An invertebrate plan without axial distribution is one of the most destructive of the elements we meet with when we enter a building in which there seems to be no centre. The rooms and corridors are arranged without any reference to the main entrance. Again, the smallness of the apartments spoils the impression: a large building with a number of little rooms destroys the appearance of consistent design and scale.

Quite as necessary in the design of interiors is it to preserve proper proportions of the several rooms and halls. In floor area of necessity each room must vary according to the accommodation. A committee-room may not be so large as a council chamber, the sizes of offices must be different; a class-room is necessarily smaller than a lecture theatre or a central hall; but if the floor areas must vary, so ought the third dimension, or height. It is the element of this third dimension which constitutes one of the chief problems in the interior design of our public buildings. The architect has to consider his structure, composed of variously sized solids or rectangular prisms or cubes—in other words, rooms, and the skilled in his profession takes great pains to give each of these prisms its due proportion. But let us look at the method pursued by many modern architects. The building, say, is one of two or more stories, the rooms vary in floor area, but they are all cut off to the same level by the ceiling above. The designer has only one idea of making the most of his space, and that is to divide the stories by level floors, the consequence of which is that a small office of, say, 18ft. by 15ft. is made the same height as a large committee-room or sessions court. The small room looks ridiculously high, the large room depressingly low. Everyone who enters the building is at once struck with the extreme disproportion of the rooms, a strange inconsistency, as anyone may who has gone over the Home and Foreign Offices at Whitehall. Several inconvenient results follow from this division, the windows of the small offices are too low, and a great space of dead wall is above them, or they are too high to be pleasing, just as the lines of fenestration are arranged. A large number of our modern municipal buildings, vestry halls, and polytechnics are spoiled by the level floor; the small, high rooms are cold and uncomfortable owing to the quantity of cold air above which has to be warmed; artistically the rooms are utterly ruined for any decoration, as they are so ridiculously out of proportion. Of course the "pitch" or height of each story has to be regulated by the requirements of the larger rooms if we adopt this system of design.

To avoid the disadvantages of the level floor, one or other of three distinct methods can be adopted, whichever appears to be desirable. For buildings of only one story, or composed of large apartments, like a public library or a polytechnic institute, where a public lecture hall or concert rooms are required, every main apartment may have its own independent roof, which can be constructed at a proper height, and the two-storied blocks be relegated to the ordinary rooms and offices. The Houses of Parliament and the Courts of Justice are examples. Several recent public buildings, like those of the Sheffield and Bury Municipal Offices, are designed upon this principle, the roofs being of varying heights. The proposed Museum Extension design for South Kensington adopts the same plan, each great court being independently roofed. But while many of our large public buildings are so treated, the architect cannot always resort to this method. He cannot do so when the site is small, and many stories are necessary. There are two other plans open to him. The method which experienced architects adopt to reduce the height of the smaller apartments is to introduce the entresol arrangement—a plan which insures all that the most exacting architectural conditions can require. It is undoubtedly the most sensible and artistic mode of getting over the difficulty of inequality, and producing an interior worthy of the architect. Here an intermediate or mezzanine story is introduced over the smaller apartments, which answers admirably for a third or smaller series of rooms, as we find has been introduced in many of the larger hotels and club-houses in Northumberland-avenue. A good recent example of the mezzanine treatment is to be seen in the National Liberal Club, by Mr. Waterhouse, R.A. The smoking-room on the basement floor, with its canted ends, bay windows, fireplace recess, and detached columns, is a pleasing architectural room, 100ft. by 35ft., and 23ft. high. This room was the regulating datum as to height. An intermediate floor for various rooms is introduced over all other portions of the basement, and is called the lower ground floor, occupied by reception and dressing-rooms, &c., for members. Three large apartments—dining, reading, and grill room—occupy the next floor, and preserve an equality of height, except a small portion at the back, which has a mezzanine for lavatories, &c. This arrangement of mezzanine rooms for serving and retiring rooms is carried up; but the principle of classification is apparent—that is, the large and important apartments are on one floor and the smaller rooms and bedrooms occupy the upper stories, which are lower. The profession would do well to bear this principle in mind, to arrange their large apartments in a single story, and to subdivide a portion for the smaller rooms or plan them in stories of less height.

The third method is to adopt expedients for reducing the apparent height of the smaller apartments by means of coves, domed ceilings, and vaults of plaster, instead of allowing the bare walls to rise to the full height of the story. Much more art can be expended in this way if architects studied more the interior of their buildings, and many old edifices show a skilful arrangement of ceilings to meet the variety of size and form of the rooms. In the *Transactions* of the Edinburgh Architectural Association, Mr. Thomas Bonnar, in describing Drum House, points to the interest of the interior, especially the hand-wrought plaster decoration of its walls and ceilings, and the refined details, and the internal proportions of the rooms. He observes: "Taking the series of rooms of different sizes on one floor where the height is the same throughout, by the introduction of deep covings or domed ceilings, their height is thereby apparently reduced to suit the proportions of the smaller rooms, and so securing pleasing proportion, and giving variety of treatment to the rooms throughout." Many other old examples of interiors may be seen where a coved or domed ceiling, by reducing the apparent height of the room, brings it into agreeable proportion to the rest of the apartments. By the use of fibrous plaster we have a convenient materal for this last-named method. Other means of accentuating or disguising height by the use of detached columns, pilasters, or deep friezes and wall decorations which draw the attention to vertical or horizontal lines are at the service of the artist. The methods we have discussed are those which belong to the design, and as such demand the attention of the architect of every interior who desires to bring it into an agreeable harmony.

"BUILDING NEWS" DESIGNING CLUB

A PARISH HALL.

"NIL NISI BONUM" is accorded the first place, "Smilash the Goth" takes the second, and "Vulcan" the third place in this competition. The following were the conditions issued for the instruction of the competitors:—"A parish hall for a site in the middle of the roadway of a village street, with a trough for horses and a drinking fountain attached. The land available for building is a triangular piece 90ft. long, 30ft. wide at east end, and 55ft. wide at west end. Roadway both sides, north and south, running east and west. The main entrance to be at the east end. The fountain to be in the wall at the west end. The accommodation to comprise a hall for entertainments and parish meetings, with a small recessed stage at one end; a small retiring-room available for committee meetings, a w.c. and small lavatory, and a gallery is to be provided at the entrance end of the hall. Style suitable for stone walling, and stone slab slated roof; scale, 8ft. to the inch. Plans, three elevations, and a section with perspective view."

We publish illustrations of the two leading designs, which, though the best, are not so good in detail as we could have wished. This probably must ever be the case, and with students' work it is only fair to make allowances, particularly when architects of experience and practical builders often commit foolish mistakes. The author of the first design makes his stage none too large, and the planning of the accommodation behind is crudely put together without much regard to the best use of the space available. It is, however, more spacious and workable than in the second plan. At any rate, actors can get round at the back of the stage, though they would have to beware of the doors in doing so, for they hang inconveniently. Two staircases at the other end to the little gallery seem hardly necessary, and there is no ticket or porter's office to govern the entrance. The design externally speaks for itself, and calls for little comment. The tall, unbroken gables at each end give solidity and dignity to the proportions, and without approving of the design of the windows, which we hardly like, the general character of the building seems effective and fairly suitable. "Smilash the Goth" is more original in his notions, with a fancy for conceits. His plan, too, has some good points about it, with sliding doors, for example, at the entrance; good window to the stairs; and a pay-office. He also remembers "Parish Councils" and the forthcoming election, and provides a "speech gallery" from whence the "free and independent" may be enlightened, and votes secured. These are points indicative of thoughtfulness, and his elevations show a love of the picturesque ambitiously aimed at, not always with a sober regard to economy or utility. For instance, the solid turret excrescences flanking side gables are a trifle meaningless. "Vulcan" marks his building by a Scotch-like tower at the entrance end, which has much to commend it. The hall behind the tower, however, has such a squat flat-pitched roof that we cannot entirely appreciate the designer's ideas of proportion. The absence of a cross section prevents us from learning how this roof is really constructed. The stage in this plan is too confined, and has only one doorway leading on to it, and this by way of an awkward dark staircase nearly all winders. Otherwise the retiring-room arrangement is above the average, with the w.c. nicely screened for privacy. "Fire Fly" sends a design of much merit suitably treated in a quiet style in harmony with village surroundings, with perhaps too great a resemblance to a parochial school-house. A kitchen is provided for the requirements of soup making and for public gatherings of a social character; but the stage is not very well adapted for theatrical entertainments, for the same objections noted in "Vulcan's" plan. "Unitate Fortior" covers the entire building with lead. This would make a good job, of course, but the price would in an ordinary case make the provision impossible. We specified stone slab slates. Externally the design has an individuality of style; but the big "Late and flat" windows are much too low down, so that every street urchin could look in or break the glass in passing. The entrance is very cramped, and the staircase to the gallery is too confined. "Ilex" spoils his building by the queer additions at the entrance end, which seem stuck on to the hall. The main structure is, however, suitable, well-proportioned, and nicely drawn. We cannot praise the plan. "Q. E. F." gives a capital platform, though the lobby behind would be dark. The large gables flanking the hall enable the author to bring his eaves low down; but they tend to make the building resemble a board school. The end elevations are poor in treatment. "Red Lion" carries his roof principals on piers, and puts dormer gables, with big windows, in between; thus his roof lines are very long, without economy or effectiveness, for the dormers give a crowded appearance, while the space between would be expensive to cover in. A circular staircase leads to the gallery at the entrance end, and over the porch is a balcony. "Sniktaw" puts a range of squat windows under the eaves of his hall, and breaks the length of the return façades by a bold chimney. This keeps the lights out of harm's way, and gives a quaint effect; but the plan in its details is very crude and wanting in study. "Horseshoe" draws in outline, so that his drawings look thin and wanting in colour. The bald tower at the entrance end does not grow out of the plan naturally, but in itself the outline is pleasing, because so plain. The oriel adjoining does not harmonise with the rest, and the door is shockingly ugly. Nothing of special merit can be pointed out in the plan. "Pastime" has not realised the sort of thing intended, and his plan is ill-contrived and cramped to a degree; but we place him here by reason of his aim at the picturesque, supported by industry. Work continued in this spirit must lead to improvement, if not to success. "North Pole," too, has made an honest endeavour with simple methods and neat drawings. His canopied drinking-fountain is an exception which we cannot admire, and it is quite too important for the use contemplated. "Tyro" marks his stair turret by a spirelet over a squat tower, and his style is mixed, especially the entrance-door under a very pointed arch. The amended scheme for the position of the fountain we have duly noted without admiration for either. "Sunset" wants spirit and colour in his design; everything looks so tame and ineffective, save the clouds in the perspective, which prefigure a deluge. "Excelsior" groups his drawings all ways on the sheet like a puzzle, and makes his plan by the rules of contradiction, narrower at the wide end of the site than at the other. His stage is perfectly unsuited for theatrical performances, and his oriel off the gallery is useless. "Flint" tapers his building to make it exactly follow the lines of the site, so that the roofs, being all one height and pitch, would have a wide gutter on the top. Internally, the plan would be convenient, so far as the hall is concerned, and the drawings indicate that the author ought to do better things than this. Of "Black Prince" we expected more, but he continues to shake our faith in him. His plan shows care, and his stage would do, but all the parts lack finish. His perspective does him no credit. "Reo" draws in an inky style, and designs in a curious manner. The gallery end is marked by two squat towers, and the design is much too full of features. "Sweet Auburn" comes next, but we cannot praise him, though we have carefully examined his drawings. "Jap," if not quaint, is nothing, with ingenious bits dodged together, and a wonderful pent over the drinking fountain. "Triangle" adopts a Scotch style, and spans his entry with a sprawling arch against a circular tower with a conical roof over it. A similar turret on the other side of the plan is cut short under a pent. The design would look better in execution, but apparently the roof would not stand if carried out. "Westward Ho" puts his hall in a line with one side of the site, and so gets his stage on a skew at the rear. "Wit" inserts a traceried window at the back of his stage, and we take the suggestion as a joke. The building is covered with an iron roof. "Sphinx" comes next with a very long hall, and then "Symbol" with a quiet-looking building and fairly good stage. The staircase cramps the dual entrance by bringing the people all together at its foot. "Baluster" makes an endeavour at an Old English type of hall, and is one of the few who have given an admirable stage at once roomy and spacious. "Jocelin" sends a plan like a church, transepts and all. "Graham" adds a tower at one end, which does not harmonise with the rest of his design. The remainder of the designs rank as follows: "Sanitas," "Sector," "Excelsior," "Norman," "Hardwick," "Orient," "Student Rick," "Filiolus," "Phœnix," "Forward," "Compass Box," "Glencoe," "Kiki," "Mica," "Q. E. D.," "Rosinante," "Yorkshire Tradition" (an oval hall done by a man who ought to do better), "In Haste," "Gargoyle," "Peterborough," "Love's Labour?" (no name and address), "Old Postage Stamp," "Amor Patriæ," "Jamrach," "Ich Dien," "La Cigale," "Mars," and "Joiner."

STAINED-GLASS ARTISTS AND ARCHITECTS.

A SERIES of four papers on "Stained Glass" was read at the meeting of the Royal Institute of British Architects held on Monday evening. The President, Mr. MacVicar Anderson, occupied the chair, and there was a large attendance of members. The walls of the room and the screens were hung with cartoons and reproductions in colour of painted windows, while on the lecture table were shown leaded lights and specimen frames of enamel and pot metal glass.

Mr. R. Herbert Carpenter, F.S.A., F.R.I.B.A., in an introductory paper, remarked that although the architect should be responsible for the whole internal effects of his design, it was not necessary to determine exactly how far the stained-glass decoration should be under his control. He should, however, be able, without vexatious interference, so to direct those working with him that the painted glass should in style and treatment harmonise with the architectural design of the building, and with its decorative treatment. Through successive centuries the relationship between architecture and glass-painting had been very intimate. In early Christian times the intense sunlight streaming through small window openings filled with gem-like glass afforded a striking and brilliant contrast to the large wall-spaces. As architecture travelled westward and northwards into less sunny regions, in the 11th and 12th centuries, windows necessarily became larger, but the "mosaic" glass, with its Byzantine ornamentation, was still used, the gorgeous and jewel-like effect of colour being emphasised and intensified by lines and points of white glass, and the bold black geometrical forms of the frame-work. In the 13th century not only the gem-like glass, but silvery and brilliant pattern-glass, of white with a bluish tinge in it, was used, together with rich bands of pictorial figure-subjects, on a white ground. In the 14th century the mosaic glass, as such, went out of use in the great mullioned windows, but its rich colours were retained, in combination with a lemon-yellow strain. The window tracery of this period was designed to frame the translucent pictures, though as years went on, and the masonry became more studied in design, the glass had to adapt itself to the masonry, rather than the masonry to the glass. As large windows multiplied and the area of glass increased, a larger proportion of white or greenish-white quarry-glass was employed, as was seen at Exeter Cathedral, an example which modern glass-workers would do well to follow. By gradual changes the most characteristic and beautiful English glass, that of the 15th and the early part of the 16th centuries, grew up, acquiring greater breadth than the gorgeously-tinted earlier glass, and infinite delicacy of drawing and tone, and combining with it especially painting on white glass with enamel colours and stains. At this time one mind and one idea seemed to inspire the designers both of the buildings and of their glass. After animadverting on Professor Moore's statement that nowhere, save in France, was there in glass-painting an actual spirit of original invention, the author spoke of the crude and incongruous designs or imitations of Mediæval work in memorial windows erected in the last half-century. The principle of the memorial window was of inestimable value, not only artistically and historically, but as a link of the present with the past. Symbolism in stained glass should be neither too patent nor yet too recondite. With reference to modern painted glass he laid down the following postulates:—1. That the glass be brilliant, translucent, and jewel-like. 2. That the colours be, to a great extent, of pot-metal, of unequal tone and thickness. 3. That in each building its due proportion of white glass be fixed and adhered to throughout. 4. That the ironwork should be carefully considered in designing the glass, and that no sound ancient ironwork should be removed. 5. That the leading be an essential part of the design, to be shown on the glass-painter's sketch drawings. 6. That each window should form part of a complete scheme previously determined by the architect with the authorities of the church, and it is desirable that all should be executed by the same hand. 7. That the representation of sacred subjects should not be pictorial or realistic or sentimental, but should be treated in an architecturesque and conventional manner. 8. That a carefully thought out system of symbolism should be adopted. 9. That pictorial subjects extending over more than one light should only be selected where they lent themselves to arrangement in divisions. 10. That the series of figures or subjects be selected in proper doctrinal and historical gradation from W. to E. of the church. 11. That in memorial windows the kneeling figure should be introduced in the "predella" with a legible inscription on the glass. 12. That heraldry should be an essential part of the design, especially in memorial windows. 13. That in ancient windows of varying date, the glass should be assimilated in each case to the designs of the masonry. In conclusion, as in architecture, so in the art of painted glass, history and archæology should not be disregarded, and there should be no spasmodic attempts at originality.

SOME DETAILS AND TECHNICALITIES OF THE GLASS-PAINTER'S ART.

Mr. James Powell read a paper descriptive of the process of making a painted window. The first process is, he explained, to prepare a small coloured sketch of the design, usually to a scale of one inch to a foot. On this drawing should be shown the ironwork. The sketch having been approved, full-sized cartoons are prepared. For these, studies from the life are required, the hands and feet especially needing careful study. White subjects surrounded by dark colour should be drawn smaller than when against a white or pale background. On these cartoons the ironwork and lead lines should be definitely shown, and upon the latter great pains should be bestowed, the lead lines being more conspicuous than the folds of the drapery. From the finished cartoon a tracing, called the "cutline," is made on calico of all the lead lines, and from this the cutter cuts the glass in corresponding lines. When the glass is cut it is taken to the painting room, and all the leading lines of the cartoon, and also the ornamental patterns of draperies or diapers of backgrounds, are shown with enamel pigment. The glass, after having been fired in the kiln, is then fixed with wax to a frame of plate-glass, so that it can be placed against the light on an easel. The paint (water-colour process) is then applied to the glass with a large flat brush, and worked flat or rough, according to requirements. The high lights are then removed with scrubs, and in the half-tones the pigment is reduced in density, and the shadows deepened by laying on another mat of colour. The glass is then again fired, and the above process repeated until the required strength is obtained, great care being taken to keep the shadows luminous. When the painting is finished, the silver stain is added, where required, to such parts as hair, embroidery of draperies, or foliage. The glass is next laid on its "cutline" on the glazier's bench, and the leading is put in. The lead should be from $\frac{1}{4}$in. to $\frac{3}{8}$in. in width. After the window is soldered on both sides the leads are raised, and a cement of oil, lead, &c., is rubbed well in on both sides. The copper ties are then soldered on, and after a few days the cement has hardened, and all is ready for fixing. Coloured glass is obtained by melting certain metallic oxides with the raw material or base. A good workman can so handle the melted glass as to produce variations of thickness, from which, of course, result varied tints of the same colour in one sheet. In some recent experiments the traditional charcoal yellow had been hit upon, and it had been found to be almost identical with the straw-yellow of the 13th century. Glasses made as above described are known as pot-metal colours. Flushed or cased glass is used chiefly for ruby glass, the colouring matter of which is so dense that it is blown on a base of white glass; beautiful shades are also procured by casing the ruby with a blue or yellow glass. One great advantage of the cased glass is that you can protect portions of the design with Brunswick black, and with hydroic fluoride remove the unprotected parts of the coloured film, and thus expose the base colour underneath. This is especially useful in heraldic designs or the patterning of robes. The enamel used by the glass-painter for shading and outlines is a fusible glass containing a sufficient quantity of an infusible powder to produce the effect of opacity. The window may be painted entirely in water-colour, or it may be traced in oil-colour and matted in water-colour. The leads used in old windows were usually very narrow—about $\frac{3}{16}$in.—and were cast in their full length. A great deal of the old work had been re-leaded with wider lead than that originally used. The leading of the 13th and 14th centuries was mostly designed in diagonal lines, and this diamond form gave a perfect drain for the water. For a window designed in a strong key of colour as much lead as possible should be used: in the whiter windows less lead is required. To the ironwork the artist should pay special attention. Saddle-bars should not be more than 12in. apart. The most useful arrangement for modern work, except in very narrow windows, is to have a double stanchion, with saddle-bars at distances varying from 10in. to 12in., according to the width of the lead. If the architect wishes for outside iron as well, the glass-painter need not grumble, for it enhances his work. Wire-guards are an abomination to the glass-painter and a detriment to the architect, and sheets of plate-glass outside look worse still. A lead across a broken pane is preferable to a wire-guard. White glass should predominate, though an east window requires more colour than a side window. Too many different colours should not be used in one window. The best decorative effects are produced with a simple scheme of colour. There should be harmony between the glass and its frame. This harmony is never wanting in the old work of the best period, and hence it may be supposed that the architect must have had considerable supervision of the glass. Windows should not be crowded with too many figures. A better decorative effect and greater repose might be produced by using more ornament and fewer figures. The scale of the figures used requires careful study, and as to this the architect should assist. Arms and legs should not be thrown behind mullions; large compositions of figures and canopies running across several lights should also be avoided. Lastly, a scheme should be carefully prepared for the subject of the window, and the glass-painter should work in harmony with the architect.

THE PAINTED WINDOWS AT FAIRFORD, WINCHESTER, AND KING'S COLLEGE, CAMBRIDGE, AS MODELS FOR MODERN WORK.

A paper on this subject, written by Mr. N. H. J. Westlake, F.S.A., was read, in the author's absence, by Mr. H. D. Caröe, one of the hon. secretaries of the Art Standing Committee. Mr. Westlake pointed out that the considerations in studying old work were—(1) The appropriateness of glass in the church so far as light is concerned; (2) the scale of the details in proportion to the building; and (3) the composition and colour value—the last being the most important in an artistic sense. At Fairford and at King's College, although the edifices were completely filled with painted glass, there was plenty of light. At Fairford the openings were moderately large, the glass fairly but not densely covered, and there was a great area of white in the canopies and draperies. At King's College the openings were large and numerous, there was less white, and the paintings were more dense. Chartres was an instance of a dark church—the darkness not resulting from the amount of shadowing pigment on the glass, but from the smallness of the details, which involved so much lead and iron that a great area was rendered opaque. The proper character and quality of the painting on the glass, the quantity of pigment to be used, the amount of obscurity in painting on white and on colour, had been but slowly learnt by the artists in different countries. The earliest work was similar wherever found; but in the early years of the 16th century the northern countries used less pigment than the southern. English work of the best periods was as delicate and translucent as any: let them compare Fairford, King's College, and Winchester with the German and Flemish glass of St. Mary's, Shrewsbury, and Lichfield Cathedral. The painting at Fairford was often unequal in tone, the inequality being in most instances intentional—*e.g.*, the west window had more pigment than the aisle windows; but the diversity in covering the glass at Fairford was not so apparent, nor so necessary, as in a large edifice like Winchester Cathedral. In King's College the difference between the chapel glass and that in the large windows afforded an excellent comparison by which to acquire a knowledge of the painting of the glass under different conditions. Many of these windows, however, had been badly overpainted in restoration.

THE RENAISSANCE PERIOD AND THE USE OF ENAMEL.

Mr. Clement Heaton, in his paper, remarked that glass painting originated from enamelled metal-work, and in its early form was an assemblage of small pieces of glass, heavy in texture and strong in colour. As years went on it became lighter and lighter in general tone, the glass itself becoming thinner in substance, and the colour less intense, while in all ways there was a progression towards lightness. A style of work was arrived at late in the 15th century containing principles which could not be departed from without loss of effect, and which he considered was in England more successful than in France. Admirable as this work was, it was not the highest development of glass painting. There was a limitation of design and conception, power of colour and drawing, compared with both earlier and later work. The earliest glass was Geometrical in character, and the later Gothic purely architectural. The canopy work based on architectural models was monotonous through its endless repetition. In the 16th century, when new ideas came into France from Flanders and Italy, glass painting was thriving as regards technique, and the Renaissance was really in design alone; motifs of ornament from Flemish and Italian Renaissance were adapted and expressed in Gothic technique. It was to the breadth of study then in vogue that Mr. Heaton attributed the power of the work done from 1520 to 1550. The works of the Middle Renaissance showed a wondrous combination; the true principles of glass painting—glorious colour, refinement, grace and power of drawing, vigour of design, and individuality of conception—all might be found united in the same work, and that work such as only artists who knew all the technique of glass painting could produce. After 1550 the glass painter aimed less at producing a beautiful glass painting than a picture full of strong contrasts in light and shade; the technique was interfered with to obtain such contrasts, and so the grace and the silveriness of the glass was lost and the colouration sacrificed. There were, therefore, three distinct phases of work to consider: (1) Where sound principles and traditions were worked upon, but with limited artistic powers; (2) where these same principles were used, combined with great artistic power; and (3) where this power was misdirected and crippled by the abandonment of the true principles. Study of the second phase—the most notable—showed that certain principles must be adhered to, and that mere use of them, without individuality of conception and personal care, would only lead to monotony. The breadth of study among the artists of the Renaissance was well worthy of attention. Mr. Heaton then proceeded to mention the introductions in technique of the Renaissance. The pot-metal colours had been much extended in range, which was due to the system of plating; the silver plating was made to produce not only yellows, but orange and red; the brown painting colour was supplemented by a flesh red; and, finally, transparent enamels were introduced about 1540. In the MS. of Theophilus—12th to 13th century—instructions were given for "placing gems on glass," and a description was added of how small pieces of glass were to be cut out, put on white glass, and melted on to it. Various examples of this process were known, but the method was unsatisfactory, being both laborious and uncertain in effect; the use of fluoric acid had done away with the necessity of grinding the glass, but the use of transparent enamels best got over the difficulty of which all glass painters had been sensible. It was probable that the application of transparent enamels arose through the use of enamel in goldsmith's work. Whether the idea came direct from Italy, or the French themselves adapted the enamel to glass from the enamelled jewelry and pottery, it was difficult to say. At Rouen there were several examples of the use of enamel in conjunction with pot-metal glass, and enamel colour alone was used in the 16th century for panels and medallions. It was also used in Florence about 1560, and in England in the time of Elizabeth. Although so extensively used it had sometimes been urged that its use was illegitimate, but properly worked it was very reliable, for enamels done in 1540 were sound at the present day. As to the artistic use of enamel, any attempt to use enamel colour in large quantities and in rivalry to pot-metal glass the author condemned. In conjunction with pot-metal glass, it might, however, be of great value. For domestic use it could be a means of rendering colour in a fine way in harmony with modern interiors, which leaded colour was certainly not.

Mr. Alma-Tadema, R.A., proposed a vote of thanks to the authors of these papers, reminding those present that stained glass had exercised a great influence on art and architecture, and that the mind of Viollet-le-Duc was directed to the study of the history of art by examining the stained glass in the windows of Notre Dame at Paris. The authors of the papers dwelt on the religious aspect of the subject almost exclusively, and had scarcely touched on the use of stained glass as an ornamental or architectural subject. In towns, where windows often looked on to blank walls, the use of stained glass was very desirable. Mr. John Lafarge, of New York, had made a new departure in stained glass by the introduction of thickened portions, and he has the possession of one of his works which when the sun shone though it looked as if it were studded with old jewels. He would ask how old was the use of coloured glass? He believed that it was used by the old Romans, for in a house at Pompeii he found let into a wall some beautiful purple glass, and in a fountain in another house in that city he saw fragments of glass of different colours dabbed into the cement of a fountain.

The Bishop of Ely (Lord Alwyne Compton), in seconding the vote of thanks, expressed his delight at hearing Mr. Powell condemn the use of wire guards to windows. Certainly with old windows there was the excuse that the work could not be replaced, but why anyone should so protect a modern window he could not understand. There were some modern windows he should be glad to see broken. One point was often forgotten in arranging a scheme of stained glass, and that was the requirements for plenty of light in certain parts of the church, as at the east end. The usual plan was to begin with the chancel and work down with memorial windows towards the west end, so that while the work was in progress—and it was usually spread over many years—most churches appeared increasingly dark as viewed from the west end. He would suggest that plenty of white glass be let in the eastern windows, although he was not fond of the latest style in windows, which was to have them almost all white, for although beautiful in drawing they were unsatisfactory in effect. In one of the recipes of Theophilus we are told to use old sapphires for blue glass, and he believed that these "sapphires" were not actual precious stones, but old Roman glass such as Mr. Alma-Tadema had referred to.

Mr. T. G. Jackson, A.R.A., who was heartily greeted on rising, observed that such opportunities as that meeting afforded to artists and architects to meet together and discuss their craft was likely to advance their art. Stained-glass workers seemed to be beset by the peril and danger which threatened all in that room of lapsing from their art into archæology. They had in the study of stained glass any amount of material to select from, and the artist must make up his mind what he would reject and what he would develop. Thanks to the advance of modern chemistry, it need no longer be said that it was impossible to imitate the colours of ancient glass. The most noteworthy work for our purpose was, he thought, the later glass, which presented gorgeous effects of colour; but abundance of light was most desirable. Some people carried the love of colour too far, and were not satisfied unless every window was filled with stained glass; but a man who would put cathedral glass into every window of a church was capable of doing anything. He very much regretted that the clerestory windows of Westminster Abbey had been filled with stained glass, as we had lost the play of light we used to enjoy in the Abbey. In town churches stained glass had its uses in shutting out uncongenial prospects, but in the country the glass needed to be very good to compensate for the loss of blue sky and green trees. In the two great churches at Nuremberg, the lower parts of the windows were filled with stained glass, but the upper parts above the mullions were left clear, and a similar treatment was followed at Wadham College, Oxford, the treatment being the original one of 1622.

Mr. Henry Holiday urged that archæology was not art; that no great artist of the past ever succeeded in producing good work by imitating what had preceded his own art, but by developing that which he found. Anything was better than servile imitation of the past, and an artist had better commit a few technical blunders than make a lifeless reproduction of a past style merely that his work should agree with the masonry around it. He defended the introduction of a certain amount of realism in stained glass, while recognising its limitations and keeping as far as possible from mere pictorialism. M. Lafarge was a genuine artist, and gained fresh effects at a slight expenditure of labour in manufacture; much depended on accident in his mixing of the various kinds of glass, the only hand labour being the painting of faces, hands, and feet, and as a whole Lafarge's work was more suited for ornamental than monumental purposes.

Mr. C. W. Wall and Lewis F. Day having spoken, the vote of thanks was carried by acclamation.

THE SOCIETY OF ARCHITECTS.

A MEETING of this society was held on Tuesday evening at St. James's Hall, Piccadilly, the President, Mr. W. H. Seth-Smith, F.R.I.B.A., in the chair.

The following paper was read by Mr. Ellis Marsland, Member of Council and District Surveyor for Camberwell, entitled

ARE ANY AMENDMENTS DESIRABLE IN THE PRESENT LAW RELATING TO BUILDING IN LONDON?

The present law relating to building in the metropolitan area is contained in something like eight Acts of Parliament, dating from 1844 to 1891; it is, therefore, a somewhat complicated task for those interested in building operations within this area to make themselves acquainted with the provisions of these statutes, especially as in some of them other matter not connected with building is incorporated. It is proposed by the President of the Local Government Board to consolidate all these enactments, or so much of them as relates to building operations; and for this purpose he has prepared a Draft Consolidation Bill, in which the Building Act and its various amendments are brought together. Mr. Ritchie is open to receive and to consider any amendments of a minor and non-contentious character, which experience has shown are desirable. It is therefore necessary that those who wish any alteration, or who have any suggestions for amendment, should, as early as possible, formulate their views and forward them to the right quarter. This is being done by the London County Council, the Royal Institute of British Architects, the Surveyors' Institution, the District Surveyors' Association, and by a body of delegates representing the various local vestries and district boards. There is a good deal of difference of opinion as to whether any alteration is desirable in the existing law; and also, if any be necessary, of what it shall consist. It is therefore the duty of this Society, if it is thought any improvement can be effected, to send up its views to the Local Government Board as early as possible. For whatever is done now will in all probability remain as the London Building Law for some years to come. Let us, therefore, in discussing this question of Building Law, ascertain—I. What are the conditions necessary (as far as building operations are concerned) to life in a large town? II. How far the present Building Act and its amendments meet these conditions? III. If these conditions are not met, what is further required? I. The conditions necessary (as far as building operations are concerned) to life in a large town are briefly these:—(*a*) Safety from spread of fire. (*b*) Protection from one's neighbour. (*c*) A healthy house. (*d*) A stable house. (*e*) Reasonable facilities whereby old buildings can be rebuilt. I propose, therefore, to briefly review the various clauses of the Act under these several heads, pointing out what could be usefully suggested as amendments. (*a*) Safety from fire.—Under this head the protection afforded by the existing Act consists of rules, whereby buildings are to be inclosed with walls of incombustible material, and separated by party-walls, such party-walls being carried 15in. above the roof. This provision, however, in cases of warehouse walls is insufficient, and might with advantage be increased to 3ft. Limit of size of openings in party-walls and provision for iron doors on each side of same. But there is no limit as to their number, a regulation for which would be an advantage. Limit as to the amount of openings in external walls. Rules for chimney openings, backs, flues, hearths, shafts, and flue pipes, all of which appear to be sufficient with the exception of the chimney backs to kitcheners, as the maximum thickness of 9in., where the chimney breasts are not back to back has been found insufficient, and fires have occurred by the overheating of the chimney-back, where the string of the stairs of the adjoining house has passed across it. Rules as to timbers in party-walls and in and about flues. Rules as to covering roofs with incombustible materials, and eaves and all projections to be of fireproof material. Under this head we also have rules as to stairs, corridors, passages, and landings of public buildings being of stone or other fireproof material. Stone is, however, perhaps one of the worst materials of which such portions could be constructed, as under the influence of heat it flies, and is more a source of danger than safety. In buildings of more than 125,000c.ft., and used as a dwelling-house for separate families, the same rule applies, and in sets of chambers or rooms tenanted by different persons in a building exceeding 3,600sq.ft. in area, each suite is to be divided from its neighbour, above or below, by party-arches or fireproof floors, or at the side by party-walls. There is a good deal of vagueness about these two sections, and as the class of building known as "flats" was scarcely known when the present Building Act was framed, some amendment is necessary to meet such erections. There is also a limit to the size of warehouses—viz., 216,000c.ft., and this is only to be exceeded on certain conditions, and in no case to be above 450,000. Also a limited angle at which warehouse roofs may incline. (*b*) Protection from one's neighbour.—Under this head may be classed rules as to the limit of height of buildings, which now is 90ft. (exclusive of two stories in the roof and of ornamental towers, turrets, or other architectural features or decorations), without the consent of the County Council. This limit is too high, and might be reduced to 75ft. with good effect. There is also another rule affecting the heights of buildings, but it is contained in the Metropolis Local Management Amendment Act, 1862, and limits the height in new streets of a less width than 50ft. to the distance from the external wall or front of such building to the opposite side of such street, except with the consent of the London County Council. The Dangerous Structure clauses of the Act may also be considered under this head, whereby buildings that have become dangerous to the public may be promptly dealt with, and summarily taken down if the owners after due notice neglect to do so. These provisions seem to work very satisfactorily, and the only complaint I have heard is that from the owners, who have to pay the costs incurred by the proceedings. Another very useful section is that dealing with dilapidated or neglected structures. It is very deleterious to surrounding properties to have in their midst premises that are uncared for, whose windows are broken, and whose doors are open to all who choose to enter. These premises can be promptly dealt with, and the owners either made to take down, repair, or rebuild such premises, or otherwise to put the same or any part thereof into a state of repair and good condition. Dangerous or noxious businesses are not to be carried on within 50ft. of any building, and no person is to erect a building nearer than 50ft. to a building where a dangerous business is carried on, or a dwelling-house nearer than 50ft. to a building where a noxious business exists. It would, perhaps, be an advantage to increase the distance in the case of noxious businesses; but the Public Health Act could, in all probability, deal with any nuisance that might arise from the close proximity of such buildings. (*c*) A healthy house.—The Building Act of 1855 did not deal to any great extent with the sanitary conditions of houses, and the only sections dealing with matters of health are those making the minimum height of habitable rooms 7ft., and for a room in the roof a minimum height of 7ft. throughout, not less than one half the area of such a room. In the opinion of some this should be increased to 8ft., but others think that the height should be in proportion to the dimensions. Another section deals with the provision of an open space in the rear or at the side of a dwelling house of at least 100sq.ft., unless all the rooms can be lighted and ventilated from a street or alley adjoining. Subsequent amendments and by-laws have enlarged the scope of the laws dealing with matters under this head, and now the site of every building has to be covered with 6in. of good concrete. A damp-course has to be inserted in all walls. The walls and cellars and underground rooms, where they abut against the earth, have to be protected by materials impervious to moisture. The tops of parapets have to be finished with bricks on edge set in cement, or by a coping of any other waterproof or fire-resisting material. Soft bricks are excluded from external walls and from internal walls below the damp-course and from the parts of walls above the roof, including chimney stacks. The amount of open space has also been increased, and is at present in proportion to the frontage. But there is still room for amendment here, and there should be at least a space of 10ft. from the back wall of any house or building to the boundary in rear, or, if the house has a projecting addition, then the same distance from the back wall of such addition. This would be a simple way of securing a much needed addition to the amount of open space, but the London County Council proposes that the open space should be determined by the height of the building, and that an angle of 45° should be drawn from the extreme boundary of the site in rear and that no buildings should be erected outside the line made by such an angle. This, however, does not meet the difficulty so easily or so simply as that now suggested. Plastering, now, can no longer be composed of any rubbish, but must be made of lime and clean, sharp sand, with a proper proportion of hair. It may, perhaps, at first sight appear to be nothing but a natural sequence that the same individual who looks after the building of the house should at the same time superintend the drainage. This is at present supervised by the sanitary authority of the district. But I think, on reflection, the dual control is not a bad one. If this portion of the house were placed under the authority of the district surveyor, it would necessitate the employment by him of inspectors, as it would be impossible for him to supervise the entire drainage of his district, as, besides that of new buildings, all reconstruction, alteration, or stoppage of drainage would come under his control, and there would be considerable overlapping with nuisance inspectors and officers under the Public Health Act. The only objection urged against the present system is that of having to give notice when building operations are commenced to two authorities; but surely this cannot be considered a hardship, any more than having to go to two or three different firms to procure the materials with which to build the house. (*d*) A stable house.—The regulations under the head of stability provide that concrete 9in. thick, and projecting 4in. beyond the bottom course of footings, shall be placed under all walls. This, of course, is little enough in many cases, but it is a matter of considerable difficulty to frame general regulations that will meet every case. On the whole, however, the class of buildings principally aimed at in these regulations is fairly met, and the proportion of lime—viz., 5 to 1—is sufficient for ordinary purposes, except where burnt ballast only is used, in which case very poor concrete is the result. This could be met by altering the regulation, and stipulating that burnt ballast should not be wholly used as the aggregate, but that only half this quantity should be allowed, and substituting gravel or Thames ballast for the other half of the proportion. There are regulations as to the composition of mortar, and it is now no longer possible that road-scrapings, garden mould, dust-bin siftings, and other deleterious matter should be used in place of clean sharp sand or grit. Walls must have proper footings, which are to project on each side for a distance of one-half the thickness of the wall at its base, and the diminution of the footings is to be formed in regular off-sets. The thickness also of walls is provided for, and, except perhaps in some minor instances, may be considered sufficient, and in the majority of instances even in good work it is rarely exceeded. One defect, however, is that adequate provision is not made for piers upon which corrugated iron columns are placed to insure their being of sufficient dimensions to carry the superstructure, nor are there any regulations as to the size of columns or posts under bressummers, or for the scantlings of bressummers themselves, and should a district surveyor find that there is insufficient strength in either or any of these parts, he has no power to order an increase in the dimensions, but has to resort to the Dangerous Structure clauses. It would be well if there were to be provided a table indicating the sizes of piers, columns, and bressummers, such a table not being a very difficult matter to draw up. (*e*) Reasonable facilities whereby old buildings can be rebuilt.—The section of the Act dealing with party-walls is so well known to architects that it need not be recapitulated. These regulations are at times somewhat irksome, but taking into account the various interests to be considered they do not work badly. Some further regulations are needed, so that it should be possible to build a new party-wall on the boundary of the land of two adjoining owners by giving due notice, or at least an external wall could be built up to the boundary of one's property, and that the projecting footings and concrete should not be considered a trespass on the adjoining owner's land. It cannot be any hardship on an adjoining owner to have such footings projecting on his ground, but it is a considerable hardship, especially where space is limited, to have to give up some 12in. or 15in. in order to get your footings and concrete on your own ground. One of the suggested amendments of the London County Council deals with this matter and must commend itself to architects. These remarks would be incomplete were I to omit any reference as to administration. The county of London for the purposes of this Act is divided into some 70 districts, and over each a district surveyor is appointed. These men have to qualify themselves by passing an examination and obtaining a certificate of competency from the Royal Institute of British Architects. The appointment is made by the London County Council, and when once the appointment is made, the surveyor so appointed has absolute discretion as to the discharge of his duties. He serves all notices of irregular works, and if they are not amended, takes out a summons; he supports such summons before the magistrate, and if he fails to convince the magistrate as to the irregularity, has the pleasure of paying the costs. He can, therefore, administer the Act independently, and without fear or favour. Such, however, would not be the case were the recommendation of the conference of delegates from the vestries and district boards, recently held at Kensington, to be adopted. This conference, composed mainly of speculating builders and those interested (in more than one sense) in building, adopted a resolution which is to the effect that district surveyors should be placed under the control of the local authorities. The evil effects of the medical officers of health being under such control, and being unable to act except at the dictates of a committee, very often of interested persons, is sufficiently manifest to prevent such a recomendation being adopted by the Local Government Board. It may be perhaps that my opinion on this question of administration may not be strictly impartial, and that as lookers-on see most of the game, those outside the pale of the administration, and who see the effect of the present system, may have reason to desire a different method than at present. I, therefore, will not detain you further upon this point. But there is one other matter of administration to which I should like to allude—viz., the desirability of having a separate legal tribunal for matters under this and kindred Acts. It is sometimes remarked that lawyers are supposed to know everything. But if there is one subject more than another in which their education has been neglected, it is a knowledge of building matters. It is often considerably difficult to explain to a magistrate the exact technical details in which some erring builder has brought himself within the pale of the law. There are, of course, some exceptions to the rule, and those district surveyors who have the privilege of appearing before Mr. Biron have not much cause to complain, but the exception proves the rule, and it would be a distinct advantage were a special court formed in some central position and the presiding magistrate assisted by professional assessors. Having thus briefly reviewed the law as it exists, I urge that it fairly meets present necessities; and if it be consolidated similar to the Public Health Act, and the minor amendments added which I have foreshadowed, we shall have a workable Building Act capable of administering to the wants of the times. I therefore think it unwise to substitute a new Act for one with which those interested have become acquainted, without it can be shown that any necessity exists for such a drastic change; and I have endeavoured to show that such a necessity does not exist. If I may be allowed to criticise briefly the proposed suggestions for a new Building Act made by the R.I.B.A., the whole scheme appears to me to be too ambitious, and an attempt to do too much, and matter has been introduced which would have been better omitted. I am afraid if such a ill as the Institute have suggested were ever introduced into Pariament, it would very soon meet with the fate it deserves.

Professor Banister Fletcher proposed a vote of thanks to the lecturer for his clear and concise statement of the proposed amendments of the Building Acts. Like Mr. Marsland, he could not agree with many of the suggested changes in the draft made by the R.I.B.A. committee, and so forcibly stated by Mr. E. T. Hall in another place on Monday in the previous week, especially in Mr. Hall's definition of a party-wall. He had put the practical question, What failure had they had in party-walls, either in preventing the spread of fire or in protection from neighbours? Assuming that one did fail, was there not an easier remedy than the one proposed?—for with all admiration for a "solid backbone of brickwork" to the party-wall, there was no justification for imposing additional cost on every building owner without urgent reason. He agreed with Mr. Marsland that everybody should be permitted to build as cheaply as possible, consistently with stability and security from fire, as every item of cost must be charged as rent. He could not understand why any limit should be set on the height of buildings, and certainly did not agree with Mr. Marsland's proposition to reduce it from 90ft. to 75ft. He should be glad to know his reason, if any, for selecting that arbitrary figure; and if any maximum were imposed, he should make it 100ft. rather than 90ft. Again, why should the minimum height of all rooms be raised from 7ft. to 8ft.? Surely, to be logical, the height should depend upon the size of the apartment and its purpose. The 8ft. minimum was mere arbitratory guesswork, unsupported by medical or scientific data, or constructional requirements. It was like many points in the proposed Bill: mere theory and not practice. One of our leading sanitarians, Mr. Lewis Angell, the surveyor to the West Ham corporation, recently remarked to the speaker that he regarded the provision of parapets carried up 18in. above roofs a useless expenditure when applied to cottage property, and other well-known architects agreed in this view. It would be far better to expend an equal sum in spreading the roofs and eaves so as to protect the walls from rain. The law as to open sheds needed amendment. A building on four posts could not be touched by a district surveyor, except on the ground that it was a dangerous structure, and it was difficult to persuade a police magistrate that a building not yet put up could be dangerous. Another difficulty of an opposite character was that as these buildings did not comply with the Act in having one-half of the front of solid brickwork, special sanction had to be given by the County Council for each structure, and it was unwise to give to any public body, into which corruption would sooner or later creep, discretionary or dispensing powers. The composition of plaster was too minutely detailed, and he had had large experience with burnt ballast, and had not found it so objectionable in concrete as Mr. Marsland thought it. The method proposed by the London County Council for estimating the open space to be left at the rear of buildings was very complicated: it should vary with the height of buildings. He agreed with Mr. Marsland that the drainage details should be left to parochial authorities, who dealt with stopped and defective drains. They ought to be exceedingly cautious in altering the law as to party-walls. Under the proposed changes the adjacent owner would get no compensation for any encroachment that might be made. He did not think that a special tribunal to hear building cases was desirable, for architects were not, at present at any rate, trained in judicial habits.

Mr. William Allport seconded the motion, remarking that consolidation was needed, as many clauses in the present Acts were ambiguous, and were differently interpreted by various district surveyors. The adjoining owner and his surveyor should have a right of entry on to building owners' works during the operation of building a party-wall, or of under-pinning an existing one. Duplicate plans of the drainage ought to be kept by the district surveyor, and also by the parochial surveyor.

Mr. E. Tidman urged that there was in practice no efficient inspection of drainage in the Metropolis, and in some districts, as in Holloway, the authorities had written him that they had no drainage regulations. He did not agree with Mr. Banister Fletcher that low rooms might be permitted, and should put the minimum height at 9ft. Burnt ballast was the worst rubbish for use in concrete or road making, and he was surprised to hear Mr. Fletcher advocate its employment. He thought a rule should be introduced, now in use in some provincial towns, that every room should be lighted by a window not less than one-tenth of the total area.

The President, in putting the vote of thanks, which was carried by acclamation, said the quality as well as quantity of light should be regarded in fixing a minimum. For instance, the interior of a parallelogram was far more effectually lighted by a window in the narrow side than from a larger opening in the wide side. Plaster was one of our best fire-resisting materials—a fact which was too generally overlooked. Much more vigilant supervision was needed for drainage details throughout the Metropolis.

Mr. Marsland briefly replied, remarking that he could not see the necessity for a "backbone" party-wall, as the present thickness prevented the spread of fire, and brick was so good a sound conductor that a greater thickness would do little to lessen the nuisance of sounds passing through. The clauses could not be too strict as to the composition of plaster and mortar, as these afforded a standard for the district surveyor to appeal to in condemning improper materials. Adjoining property was injuriously affected by inordinately lofty buildings, and he adhered to his view that the maximum height should be reduced. He could see no advantage in depositing duplicate plans of drainage with the district surveyor; it was sufficient to put the responsibility on the parochial authority. Indeed, the only plans that ought to be deposited with the district surveyor were, he thought, those of public buildings. In conclusion, he mentioned that the District Surveyors' Association had now under consideration the new Consolidation Bill, Mr. Ritchie having, on his (the speaker's) recommendation, sent a draft copy to that body for their suggestions.

THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this association was held on Friday evening, the President, Mr. F. T. Baggallay in the chair. Mr. F. R. Betenson and Mr. E. F. Ware were elected as members. The President announced that Mr. F. R. Farrow had presented a set of plates of Building Construction to the Studio, and that an anonymous donor had offered an annual prize of five guineas for the best series of measured drawings. Both gifts were acknowledged with thanks.

DOMESTIC ELECTRIC LIGHTING.

A paper on this subject was read by Mr. Max Clarke, member. Mr. Clarke remarked that the plant necessary for electric-lighting, at present, may be summed up as follows:—1, The power—water, steam, gas, and petroleum engines. 2. The generators, or dynamo-electric machines. 3. The accumulators, or storage-batteries. 4. The wires, or conductors. 5. The lamps, which produce the light. Speaking generally of the power, if you have to provide it, a great deal of the question of cost hinges on this. Water-power costs very little, and the same may be said of spare steam-power in factories and the like, and in many mansions and private houses in the country there is steam-power available. For small installations, the gas-engine is the best—not very expensive in itself, requires little attention, and can be put up in a small space. The great point to be borne in mind is to have your engine, whatever the type may be, well up to its work. One which is always worked much above its nominal is more or less distressed, does not go regularly, does not last so long, and needs more repairs. Having described the dynamo-machines in their several varieties, the author remarked that those "wound in series" are best adapted for arc lamps, those wound "compound self-regulating" best for incandescent lamps driven direct, and "shunt wound" best for charging accumulators. The accumulators were in electric lighting what gasometers were in gasworks—storing up and steadying the current. They occasioned a loss of energy equal to about 20 per cent.; but no private lighting could be satisfactory without these secondary batteries. The cost of maintaining them varied from 11 to 15 per cent. per annum on their prime outlay. The accumulators should always be kept well charged and set in a cool place, not above 65° Fahr. Passing on to consider the wiring, or putting in the wires to distribute the electricity, the lecturer observed that one cause of the great difference in various estimates for wiring was that labour formed a large consideration in the work. It was better to use a cable of thin wires than one large one, as the former were more pliable and afforded a greater surface area. The purity and thickness of the copper wires, and the amount and quality of the insulating material, affected the estimates of cost, which he had found to vary from 17s. 3d. to 40s. per light. The lecturer referred to the regulations for protection from accidents issued by the Phœnix Fire Office, and to those more recently published by the London County Council affecting theatres and music halls. He did not believe a single theatre installation in London carried out the whole of these sets of rules. The jointing of wires and their fixing were described, and it was remarked that the wires should be cased in American white wood, and the pieces should be connected by screws, nails not being allowable. It was absolutely necessary that the wires should be kept dry. By Messrs. Andrew's system of concentric wiring the necessity of casings was obviated. It consisted in a copper wire insulated, round the outside of which was wound a series of iron wires, forming the return. The difficulty in making branch joints had been got over in a very ingenious way. The switches for turning the current on or off should work instantly; the plug forms at first used had disadvantages in this respect, and were now out of date. The cut-out or safety fuse was the great safeguard in electric light, but in some cases was much abused. The lecturer next described the incandescent lamps, of which several varieties were exhibited, and incidentally it was remarked that the usually-assigned duration of life of 1,000 hours was an over-estimate and beyond the average. As a lamp got old it gave less light, and the glass became blackened inside. Obscured glass absorbed about 23 per cent. of the light, and opal globes as much as 48 per cent. Much remained to be done in artistic lighting by architects: not in various coloured paper and silk shades, but in genuine artistic work in fittings. Attention was called to some sections of casings made by Fawkes, of Chelmsford, specially to provide for electric light wires. They were, Mr. Clarke thought, a step in the right direction, and with a little more simplicity about the mouldings would be very useful where stock mouldings were required. In conclusion, he remarked that at present a great too much light was provided, and it seemed to be regarded as part of an electric light installation that there should be a glare.

A long discussion followed, in which Messrs. R. Langton Cole, J. Stanley Peach, W. A. Pite, H. Clarke, and others took part, and a vote of thanks was accorded the lecturer.

SOMETHING ABOUT CHIMNEYS.—I.

By F. Dye.

It must be first explained that these few papers will not deal in any way with the subject of factory shafts or chimneys applied to mechanical or manufacturing purposes; it is only intended to speak of those that are provided in our residences for domestic purposes, or any that may be temporarily or subsequently erected for similar purposes. We may consider an iron pipe chimney as a temporary erection, as no one would place a chimney of this sort up outside a building with any idea that it would remain in permanent and good condition as long as the general brick chimneys of the house.

Draught.—Before any intelligible account can be given as to the action of chimneys (efficient or non-efficient), it becomes necessary to explain as clearly as possible the phenomenon of "draught," without which chimneys would be of little service for any of the uses to which they are put. It is understood, of course, that by the word "draught" is meant the unceasing up-flow of air that will be found passing through chimneys, entering at the bottom aperture and escaping at the chimney-top. About the only occasion upon which this steady up-flow of air becomes irregular is when a chimney suffers with "down-draught," a trouble that will be referred to presently. At almost all other times, the up-draught is constant, only varying as regards its strength, for even new brick chimneys, or those that may have been disused for a long period, are commonly found to have a constant, though somewhat feeble, draught in them. The cause of this will be given directly.

The actual cause of draught in chimneys, the regular ascending current, is due to the fact that cold air is heavier than that which is hot. The cold air, by its superior gravity displaces that which is warmed in the same way that all heavy objects find their way downwards through a lighter material, as a stone dropped into water, for instance. Of course, a stone dropped into, say, sawdust would not instantly sink to the bottom, owing to the element of friction which is present between the two substances. When, however, we speak of fluids—that is, gases or liquids—the element of friction does not require any consideration, for it is totally absent.

The air composing our atmosphere consists of two gases, oxygen and hydrogen, in a state of chemical union, and existing in the form of minute particles, termed molecules. These molecules are stated to be of exceedingly small size, and supposing the air were a tangible or visible substance, the particles would still be indistinguishable even under a microscope. The chief peculiarity of these molecules is the utter absence of friction amongst them; they are free to move in any and every direction if they are agitated or caused to move by any force. The movement takes place instantly, and in a manner that is absolutely free from impediment or resistance of any description. Everyone knows how freely an object can be projected through the atmosphere; a stone can be slung a great distance into the air, but how far would the stone penetrate into a mass of sand (which consists of particles also). This goes to show the opposite results obtained when acting upon two substances composed of particles, but in which the element of friction is so utterly different.

Now the movement of air up a chimney, the draught, is brought about in this way, or rather, this explanation will serve to show how the draught is partly accounted for, as there are two or three actions taking place at once, and a chimney that has no fire at the foot of it for the time being has the draught actuated somewhat differently to when there is a fire alight. The explanation that will go to make the action understood is as follows:—Supposing a stove exists at the bottom of a chimney, as Fig. 1.

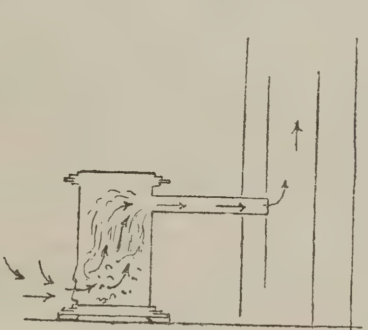

FIG 1

Now, when the fire is lighted, the air within the stove becomes rarefied by the heat, that is, it is made or rendered lighter than it was, owing to its particles having become expanded by the warmth they have absorbed. Immediately they thus become lightened, they are displaced by the superior weight of the cold particles around them, and this displacement causes them to take an upward direction. An instance of this action can be given by referring to the action of a cork in water. If we plunge a cork into a vessel of water and release it at the bottom, it instantly rises to the top. This, we should say, is caused by the fact that the cork is lighter than the liquid; but the actual cause is that any substance so placed—that is, lighter than water itself—is caused to rise by the particles of water displacing it, and it is the result of gravity that causes the heavier substance to take a downward direction, and the lighter substance the reverse.

This action, when it takes place amongst the particles of gases and liquids, is termed "convection." It takes place in precisely this manner with water, and is the action that we depend upon in all kinds of hot-water circulating apparatus.

When the air in the stove is warmed and lightened, there at once takes place an inrush of cold air through the opening in front of the stove. The warm air rises up into the chimney, and the cold air which has entered to take its place, gets warmed, and rises also, and so it goes on. The action is continuous, and exceedingly rapid, as can be judged by holding a lighted taper where the air enters the stove. The direction of the flame of the taper will show what a keen inrush or stream of air is entering the aperture.

In addition to air that may be warmed, and so caused to make an up-draught in the chimney, there are the hot products of combustion. The air which has actually passed through the burning mass of fuel, undergoes a chemical change, and becomes a gas with a different name; but it still remains lighter than the cold outer air, and consequently acts in the way described. With stoves there is very little air passes through without undergoing this change, or becoming very highly heated, and the result is a much stronger and more powerful draught in the chimney than we get with an open grate. With this latter article the open mouth of the chimney, whether the grate be an old or new pattern, permits of a deal of air passing in which is barely warmed, and this tends to retard, or at any rate interfere with the causes which go to make the draught.

So far the explanation has only applied to the up current, which is due to the rarefaction of air by a fire in a stove or grate. When there is no fire alight, the draught is still due to the convective action explained; but it proceeds from a different cause—a cause which is also present and assists when the fire is alight. This cause is the heat imparted to and retained by the brickwork of which the chimney is built.

When the fire at the bottom of the chimney goes out, it of course ceases to heat the air within the stove, and it also ceases to yield the other hot gases referred to; but it will be found that during the time the fire was giving these results, the brickwork of the chimney was actively absorbing heat as these products had contact with it. Anyone can readily discover how warm the brickwork becomes in this way, by holding the hand against the chimney-breast one or two floors above where the fire exists. The warmth is detected through 4½in. brickwork very readily and quickly. When the chimney is in this condition and the fire is out, the air which enters is warmed by the heat it receives from this source, and instantly takes an upward direction. If the fire has only just been extinguished, the draught is almost as strong as when the fire was alight.

It is peculiar to note what a length of time a brick-chimney will retain sufficient warmth to induce a draught in it. Chimneys that have not been in use for months are sometimes found to have a steady up-current of air in them, due to the brickwork still being able to impart sufficient warmth to the air in contact, to render it lighter. In perfectly new chimneys a feeble up-draught is sometimes observable, caused by the mere fact of the air inside the building being a degree or two warmer than that which is without. It may be a little difficult to grasp the fact that such a trifling variation in temperature will bring about such a pronounced action, but if a little experiment is made with water it can be easily seen. In noticing results with water, it matters not how quickly the results are obtained, it can be taken for granted that with air the action will be still quicker, as convection takes place more freely with gases than with liquids.

To illustrate the rapid action induced amongst the particles of a fluid by a very little heat, take a glass flask or jar of small size, holding, say, a pint, and nearly fill this with cold water. Into this water stir a small quantity of hard-wood dust (fine sawdust of mahogany will do), and then suspend the jar so that a lamp can be placed under, and the results noted. A small paraffin or benzoline lamp is better than a spirit-lamp for this purpose, as the flame can be turned down low, and we can see what a very little heat will do. If we place a lamp under, as Fig. 2, we shall find that, although the heat which comes from the lamp chimney is far from great, the particles of dust will almost instantly set up a motion, as shown in the illustration, and the motion of some of the ascending particles will be exceedingly rapid. By watching the dust particles we are able to tell what is happening with the particles of the liquid, for it is the movement of these latter that cause the solid particles to take the direction they do.

This action that can be thus watched and so readily understood is precisely the same with air and gases, except that with these latter the motion would be still more rapid, as just explained. Those who make this experiment will do well to notice how instantly the motion takes place when the lamp is first put under. It sometimes seems as if the movement commences before the heat has actually had time to make its way through the bottom of the vessel. It will conclusively prove that the action takes place whenever there is the faintest change in the temperature.

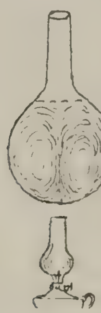

FIG. 2.

Convection currents, either in air or water, are not always due to increase in temperature. Sometimes it is a decrease of heat that causes the motion. For instance, after having the lamp under the jar of water just referred to some time, it will be found that the contents are warm. If we now take the lamp away, the circulatory action of the particles will stop; but the application of a piece of cold metal or ice to the top of the water will start the movement again. The movement will still be of the same kind—that is, descent of cold particles, and ascent of those that are warmer; but the cause is different. It is the contraction and rendering heavier of the particles that have contact with the cold object at top, and their consequent descent through their lighter fellows. These latter have necessarily to rise and take their place, and become cooled and precipitated also.

About the only instance we have of this top-cooling influence in chimneys is with those newly built or really cold from disuse. When a fire is lighted at the base of a chimney in this state, it will be found that the smoke seems positively averse to ascending the flue—it objects, so to speak, and the consequence is that most of it comes into the room, just as if a formidable obstruction existed to its free passage up the chimney. This only lasts a matter of a few seconds or minutes, as a rule. The obstruction is the overlying mass of cold air in the flue that the warmed air and gases from the fire encounter, and which has a cooling and reversing influence something similar to that just explained. It is a contest between the two for a short period; but assuming that the chimney is of an efficient character, the up-draught soon asserts itself, and the trouble does not arise again while the chimney is in regular use.

Another instance of trouble caused by a cooling influence acting upon the warmed air and gases ascending from the fire, is the persistent smoking of most of our old-pattern open ranges, and also with what are known as dog-grates or fire-baskets, as will be explained in the next paper.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE twenty-fifth annual general meeting of the donors and subscribers was held, on the 23rd February last, at the offices of the Institution, 21, New Bridge-street, E.C., Mr. Colin G. Patrick (Messrs. Mark Patrick and Sons) in the chair.

The secretary read the report, which stated that the income for the past year amounted to £806 0s. 9d., being the largest annual total received since the foundation of the institution, the amount being made up of £293 4s. in subscriptions, £406 18s. 6d. in donations, £103 16s. 1d. in dividends, and £2 2s. 2d. interest on deposit, &c. The sum expended was £455 0s. 1d., including £340 paid to pensioners, and £15 in grants for temporary reliefs. During the year one of the pensioners (Mrs. Olwer) was removed by death, and another (Mrs. Hadrill) resigned, having re-married. The number of pensioners now on the books is 16; but the total number elected since the foundation has been 32. Of these nine have died, while seven have retired, owing either to re-marriage or to improved circumstances in other respects. Referring to the Orphan fund, the school term of Edith Friend having expired, Cyril Ludford was elected to fill up the vacancy. There is yet an opening for another child, and the committee are prepared to receive applications on behalf of builders' clerks orphans, whose friends may wish to place them in nomination for the vacancy. There are also two vacant pensions, an application for one of which is already before the Board.

The 13th annual dinner was held on the 6th April, 1891, at the Cannon-street Hotel, and the earnest appeal of Mr. B. Hannen, jun., who occupied the chair, resulted in the sum of £433 being announced in aid of the funds. During the year £500 additional stock was bought, making up a total of £4,150 stock, now held by the Institution. The report concludes by thanking Mr. B. Hannen, jun., for his services as president, and also the builders, architects, and merchants connected with the building trade for their continued support.

The chairman, in moving the adoption of the report, said he had felt very much flattered at receiving the letter asking him to occupy the position of president, although he confessed to having some doubts as to his fitness for the post. He had, however, accepted, and would do the best he could, and if he failed it should be no fault of his. He felt that his influence was not so strong as Mr. Hannen's, still, he hoped to do well with the assistance of the committee. Referring to the report, he was glad to find that the amount invested was growing larger every year. He thought it most satisfactory for such an institution to increase the amount of its stock. He again expressed the pleasure it afforded him to act as president of the Institution, where he should meet many of the clerks, earnest men, who were not particular as to the number of hours they often worked, and to whom the masters were so greatly indebted.

Mr. E. C. Roe then seconded the resolution for the adoption of the report, which was put and carried.

Mr. B. Hannen, jun., and the other retiring officers were then thanked for their services, and officers for the ensuing year elected, including Mr. Ernest Stanley Rider as an auditor. During the proceedings, Mr. Brooks referred to the death of Mr. John Allbright, who had been on the committee from the foundation, and who had taken a prominent part, especially in its earlier years, in assisting to start the institution on a solid basis.

The proceedings closed with a vote of thanks to Mr. Colin Patrick for having accepted the presidency, and for his attendance in the chair that evening.

MINIMUM HEIGHT OF HABITABLE ROOMS.

WE have received a memorandum from the office of the Local Government Board concerning the height for habitable rooms under the provisions of the Public Health Acts Amendment Act, 1890, section 23, signed by C. W. Geo. Buchanan and P. Gordon Smith, F.R.I.B.A., the medical officer and architect respectively to the Board. Certain proposals for regulating the smallest or minimum height of rooms by law have been under consideration, and those gentlemen show that a room may provide sufficient floor space for a given number of persons, but be without sufficient breathing space to keep them in health. This breathing space can only be obtained by a certain height, say, 8ft.; but when the height is less than this, there will be insufficient breathing space unless the number of persons in the room is reduced. In other words, by reducing height we must increase the floor area of room. Those who let houses are only mindful of the floor area, and thus many more people are packed into low-pitched-sleeping rooms than is desirable for health. Hence it is suggested that sanitary authorities should appoint a minimum height for rooms in general, and proper regard being had to economy, it is suggested that the minimum had best be 9ft., 8½ft., or 8ft. Nine feet is preferred, but in no case, it is stated, "should a by-law submitted for the Board's approval propose for any class of room a smaller height than 8ft. over the total area of the room." Three diagrams, or span roof sections, are given, showing attic rooms, each having a mean height of 8ft., which is considered essential for rooms in the roof. These three sections show how this mean height can be obtained. Thus, in the diagram A the rafter or raking lines of ceiling give at the collar, or horizontal level, 9ft., with a minimum of 5ft. of wall to the springing of rafters. From this level to the 9ft. the ceiling slopes so that one-half of the ceiling area is 9ft. high. The lower room shows a flat ceiling of 9ft. high. Diagram B shows the attic obtained within the triangle made by the rafters and floor level; the 5ft. to springing of rafters is obtained by setting in the partition or ashlaring, then there is a short slope to the horizontal portion which has a height of 8ft. 9in. In this diagram three-fifths of the ceiling is 8ft. 9in. high. In diagram C a curb or mansard-shaped roof is shown, the flat ceiling covers a larger area (five-sixths), and the height is 8ft. 4in. In each case a minimum of 5ft. is provided for each room wall, and the height and proportion of horizontal ceilings insure the mean height of 8ft. over the whole floor area.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE ELEMENTS OF ARCHITECTURAL FORM.—Before the Philosophical Society of Glasgow on the 18th inst., Mr. James Thomson presiding, Professor G. Baldwin Brown, Edinburgh, read a paper on "Beauty and Utility in Architecture." The guiding spirits, beauty and utility, he observed, might be said to enter as constituent elements into every production of architecture; but there were, strictly speaking, four different points of view from which they might regard architectural form, or, in other words, there were four different reasons which might be given for an architectural feature being what it was and where it was. It might be what it was and where it was because it followed naturally from the material and mode of construction, or it might have been devised specially to suit some given purpose; or, thirdly, it might be employed on intellectual grounds, because it was impressive or symbolised some idea; or, lastly, it might be due to purely æsthetic considerations as a thing pleasing to the eye. The two former reasons might, however, be grouped under the head of utility, and the two latter under the head of beauty.

CHIPS.

A Bill introduced by Sir John Gorst, Q.C., on behalf of the Government, proposes to transfer to the management of the Commissioners of Works the site of Millbank Prison, in London, which is vested in her Majesty, but is no longer used as a prison.

The Sheffield Town Council has adopted a resolution giving power to inflict penalties for breaches of the "fair contract" clause, a condition being inserted requiring that such a sum as a committee may determine shall be paid by the contractor as liquidated damages.

The Ripon town council have resolved to instruct Mr. T. S. MacCallum, C.E., of Manchester, to prepare a full scheme for the disposal of the sewage of the city.

The London County Council, having been rated at a sum exceeding £11,000 for their sewers and outfall works at Barking, appealed to the Essex Quarter Sessions, on the ground that, as the sewers were incapable of being occupied at a profit, they were not subject to rating. The Sessions affirmed the rating, and on appeal to a Division of the Queen's Bench, the Judges have upheld the decision of the Court below.

During the last fourteen years, sixty-one pictures have been purchased for the National Gallery under the terms of Sir Francis Chantrey's bequest. They have cost £39,245, the highest prices having been £2,200 for Mr. Brock's "A Moment of Peril," £2,200 for Mr. Herkomer's "The Chapel of the Charterhouse," £2,000 for Mr. Vicat Cole's "Port of London," £2,000 for Sir Frederic Leighton's "Athlete Struggling with a Python," and £2,000 for Mr. Orchardson's "Napoleon on Board the *Bellerophon*."

Col. W. M. Ducat, R.E., one of the inspectors of the Local Government Board, held an inquiry last week at the town hall, Newcastle-under-Lyme, into an application by the town council for sanction to borrow £18,344 for gas purposes, and for consent to the acquiring of certain land in Deansgate, and to a loan for a new sewer. Mr. W. Winstanley, gas manager, and Mr. J. Pattison, borough surveyor, explained the proposals.

PRICES.*—XXXI.

(All Prices Include Profit.)

JOINER (*continued*).

HARDWOOD DOORS: Spanish mahogany, ordinary sizes, semi-headed, measured square, not polished—

		£	s.	d.
2in. six-panel, stop-chamfered one side, including plain stops.	per ft. sup.	0	6	9

CHIPS.

Mr. Hugh Stannus, F.R.I.B.A., will take up the course of lectures at South Kensington left unfinished by the death of the late Dr. Zerffi. He will deliver ten lectures on Monday evenings at 8 p.m. in the lecture theatre of South Kensington Museum under the authority of the Department of Science and Art, and the title of the course is "The Evolution of Decoration." The first lecture will be given on Monday next.

The Leicester Corporation has, by about 50 to 8 votes, increased the salary of Mr. E. G. Mawbey, the borough engineer, from £700 to £1,000 a year. Mr. Mawbey succeeded the late Mr. Joseph Gordon at Leicester about two and a half years ago, when that gentleman was appointed chief engineer to the London County Council.

The students attending the Honours and Advanced stages of building construction in connection with the Glasgow Technical College visited the City Sawmills, Port Dundas, on Saturday afternoon. Beginning at the log pond, they were conducted through the sawmills, workshops, &c., finally through the creosoting works, at which a vote of thanks was, on the motion of Mr. Gourlay, the lecturer, accorded to Mr. Robb, manager.

The members of the Leeds Industrial Cooperative Stores are about to build a second block of premises opposite their present building in Albion-street. The new structure will cover an area of 80ft. in frontage by 104ft. in height, and will be three stories in height. The elevation to Albion-street will be of local stone, and the other elevations will be faced with white glazed bricks. The rooms will be lofty, which will be carried on iron girders and iron columns, and all will be made fireproof. The designs have been prepared by Mr. W. S. Braithwaite, architect, South-parade, Leeds.

Mr. W. W. Spence, a native of Edinburgh, but now of Baltimore, U.S., has commissioned Mr. D. W. Stevenson, R.S.A., of Edinburgh, to execute a colossal statue of Wallace, which will be cast in bronze and presented to the town of Baltimore for erection in one of its public parks.

At Tuesday's meeting of the London County Council it was decided to vote £22,000 towards the purchase of the Hilly Fields at Brockley as an open space. Mr. S. G. Gamble was elected second officer of the Fire Brigade at a commencing salary of £350 a year, rising to £500, with quarters, coal, and gas.

Mr. E. A. Pearn, of Compton Leigh, near Plymouth, has given a mansion and twenty-four acres of land for the benefit of the Royal Albert Hospital, Devonport, and the South Devon and East Cornwall Hospital, Plymouth. On the land he purposes to erect a convalescent home, and will endow it for the joint use of the two institutions named.

The town council of Heywood, Lancs, adopted at their last meeting instructions for architects in the proposed competition for technical schools. It was decided that the schools should accommodate 200 students, at a cost, inclusive of everything except furnishing, of £2,000. Two or three town councillors suggested that the limit of cost ought to be at least from £3,000 to £4,000; but the maximum originally proposed was adhered to.

The Leek Improvement Commissioners have invited Mr. E. Bailey Denton, of Westminster, to visit the town, and report and advise the board on the disposal of sewage.

Frederick Stackpoole, A.R.A., well known as the engraver of Briton Riviere's pictures, has applied to be placed on the retired list of Academy Associates.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—F. and V. S. Co.—M. A. T.—Geo. Marshall; —G. S. and Co.—O. L. (Leicester).—T. H. P.

"BUILDING NEWS" DESIGNING CLUB.

FIFTH LIST OF SUBJECTS.

F.—A small Post Office for a small country town. The site to be in the main street, with a frontage of 25ft. flush with adjoining shops. The depth of the land available for the building is 50ft., and no back approach. The houses on either side are three floors high, including the ground floor, and run back 25ft. from the frontage line. The post office side walls are party-walls, and light can only be obtained from the back and front walls. The accommodation is to provide a good public office, with conveniences for the ordinary telegraphic business, parcel post, and banking departments, on a limited scale. To the rear of the public office is to be located a sorting-room and waiting-space for a messenger and three postmen, and w.c and lavatory. Two upper floors to afford accommodation for the postmaster and his small family. Kitchen, &c., may be on the ground floor, but the post office must be kept entirely apart, save the postmaster's door, from the house into the office. The private door to the house must be on the right-hand side of the front, with a passage 3ft. 6in. wide. The residence to comprise a living-room, a parlour, and three bedrooms, with a w.c. and bath-room. Style suitable for red brick and terra-cotta dressings sparingly used. Scale, 8ft. to the inch. Plans, elevations, sections, and sketch.

Drawings Received.—"Sphinx," "Fire Fly," "Nil Nisi Bonum," "Don Quixote," "Jamrach," "The Influenza Fiend!" "Mars" (no name or address), "Rough Work," "Signum," "Graham," "Cyclist," "Jam," "Sanitas," "Erimus," "Amor Patriæ," "Peartree," "Black Prince," "North Pole," "Jocelin," "Symbol."

Correspondence.

REGISTRATION WANTED.

To the Editor of the Building News.

Sir,—It is a thousand pities that the wire-pullers of the R.I.B.A. (who object to the protection of our profession) cannot be bodily transplanted into the provinces, where they would become subject to the annoyances and unprofessional treatment we have to put up with.

In my own town there happens to be a carpenter, who, a few months since, began to pose as an architect, by calling himself a "designer";

growing bolder a "surveyor"; bolder still, he places a large board in front of a small house he is constructing, with "architect" upon it in large letters. I am also in a position to prove he has done work, in *his way*, at less than 1 per cent. upon the cost.

A few days since I saw a set of his drawings and specifications; the former would be a disgrace to a six-months' pupil, and the latter such a wonderful concoction of bad grammar, incorrect spelling, and absolute ignorance of the ordinary methods of building, simply astonishing. I am sorry a copy could not be made for the edification of your readers.

Surely, Sir, you must agree that, after spending years of study (without mentioning the cost), it is simply abominable that such a case should be allowed to exist. Of course this cannot be a solitary instance, and if you will kindly allow the space, I would ask for the opinion of others interested.—I am, &c.,

A PROVINCIAL ARCHITECT.

THE EXTINGUISHING OF FIRES.

SIR,—The use of mineral-oil lamps being so very general, the following incident may be suggestive to some of your readers:—

Last night a large suspended oil-lamp fell in our library. The room was instantly a "sea of fire." Some members of the staff showed much presence of mind, and rushed for "hand grenades," the use of ten or twelve of which extinguished the fire in five minutes, confining the damage to the room in question, although the flames had reached from floor to ceiling. The points to which I think attention might be invited are:

1. The lamp should have extinguished itself in falling. It failed to do so.

2. The "finest water-white oil" (the quality used) is supposed only to ignite at a very high temperature. This took fire at once.

3. The hand grenades, which have been rather depreciated (and which may or may not be of value in the open air, when the gas generated is promptly dispersed), certainly acted with magical effect within the compass of a large room. Your readers will draw their own conclusions.—I am, &c.,

ROBERT JOHNSON.

The Colonial College, Hollesby Bay, Suffolk.
Feb. 19.

CHIPS.

In the case of Richard George Guy, of Fenchurch-street, City, and Loughton, Essex, timber merchant, lately trading with Lambton Lee Loraine Beven, as George Guy and Co., the discharge from bankruptcy has been suspended for four years.

Mr. Arthur Cawston, A.R.I.B.A., is a candidate in the Moderate interest for North Camberwell for the London County Council.

The Corporate Property Committee of the Leeds Corporation, at a meeting held on Friday, had under consideration numerous suggestions for the preservation of Kirkstall Abbey, made in response to the invitation of the committee by Mr. J. T. Micklethwaite, F.S.A., F.R.I.B.A., of Westminster, at whose suggestions the works of reparation have been carried out since the Leeds Corporation acquired the Abbey ruins. The outcome of a brief discussion was that all Mr. Micklethwaite's suggestions were agreed to.

Miss Clara Montalba and Mr. Richard Beavis have been elected members, and Mr. Robert Little and Mr. Lionel Smythe associates, of the Royal Society of Water Colours.

New baths and wash-houses, built by the Stockton Corporation, were formally opened on Friday in Portrack-lane. The building contractor was Mr. W. C. Atkinson. The premises comprise ladies' first-class slipper baths, public wash-house, laundry and callendering-room, private wash-house, plunge bath (75ft. long by 27ft. wide). On the first floor are men's first and second-class slipper baths, Russian and vapour baths. The contract for the building and machinery was £6,448.

Mr. Stephen W. Williams, F.R.I.B.A., of Rhayader, Radnorshire, author of "The History of the Abbey of Strata Florida," was on Thursday last elected a Fellow of the Society of Antiquaries of London. Mr. Williams is now engaged in preliminary explorations with a view to the excavation of the ruins of Talley Abbey, in Carmarthenshire. Last year Mr. Williams carried out a series of very interesting excavations at the great Cistercian Abbey of Strata Marcella, near Welshpool, founded in 1170 by Owain Cyfeiliog, Prince of Powys. A full report of the work done appears in the January number of *Archæologia Cambrensis*.

Intercommunication.

QUESTIONS.

[10728.]—**Fireproof Plaster.**—I have an engine-boiler built in, I wish to widen the flues by taking out the brick lining. Can any of your readers give me a cement plaster to protect the stone walls from the action of the fire?—FORFAR.

[10729.]—**Pile-Driving.**—It is stated in some manuals that piles should be driven with the butt, or natural lower end, downwards. Is any attention paid to this rule in practice, and if so, why?—E. J. W.

[10730.]—**King-Post Roof.**—Will some expert kindly say why a tie-beam should be deeper than the principal rafter (thus—tie-beam 12in. by 6in., principal rafter 8in. by 6in., as given in "Building Construction,") when the tie-beam is in tension?—H. D. P.

[10731.]—**Circular Ramped Coping.**—Can any of your correspondents inform me how to set out and make the moulds for circular ramped coping for each side of entrance steps to a mansion? Can I obtain any work on this and kindred subjects? Also costs? An early reply will greatly oblige.—OLD SUBSCRIBER.

[10732.]—**Smoky Chimney.**—I have just erected a pair of houses on a site just off the crest of a hill on the main road, and in one of them am troubled with a somewhat unusual form of smoky chimney—*i.e.*, when the wind blows across the pots, the flue next the one in use seems to draw the smoke into the room to such an extent as even to discolour articles of furniture. Can anyone inform me the cause, and the best means to remedy same?—NONPLUSSED.

[10733.]—**Half-Timber Work.**—I am designing a dwellinghouse and introducing timber struts filled in with cement in the gables (to wit, half-timbered work). What ought to be the scantling of the woodwork? How fixed to bricks? By wood nogs built in at intervals, or plugs driven into the courses? How far should the timber project beyond face of cement when finished? and what is the best and cheapest kind of wood for the purpose, after oak?—BLACK AND WHITE.

REPLIES.

[10717.]—**Architect and Building Committee.**—I have had a similar case to deal with to that stated by "Disgusted" in your issue of Feb. 12, the committee requiring copies of quantities for all trades for their guidance in checking the final accounts of extras and deductions, as made out by myself as architect, and the following is the answer I sent:—"In reply to yours of the 3rd, I am surprised at your demand, as neither trustees nor the contractors have now anything to do with the quantities, as they ceased on the works being let, the contract being for lump sums, and the quantities, in the first instance, were simply prepared, as customary, for the convenience of contractors, upon which to base amount of tenders, and do not form part of the contracts, according to the conditions of tender, as the signed contracts, with the drawings and specifications, are to be followed; any deviations from which are usually settled at the completion of works as per priced quantities deposited for the architect's sole use, in getting out final accounts." I have since had a deputation of six of the trustees to wait upon me in reference to my answer, but I stood to my right to withhold detailed quantities and prices in accordance with my authority under the contract. I hope other readers will give their opinion and experience, as this demand is an important innovation, and an architect should be the best interpreter of his own design and documents.—PATCHETT, HX.

[10727.]—**Portland Stone.**—There are two beds of Portland stone usually sent into the market—viz., brown, which is sometimes called "Whitbed," and upon other occasions alluded to as "Top-bed"; and the white, which is sometimes specified as "Base-bed," and upon other occasions as "Bottom-bed." Hence the "best brown Portland stone" which he alludes to is that first mentioned above. In addition to the above, there is the "Roach Portland" bed, which lies upon the brown or "Top bed" (or "Whitbed"), which is sometimes sent into the market for girder and engine beds, harbour and dock walls, and other engineering purposes.—F. J. BARNES.

At the monthly meeting of the Cardiff Rural Sanitary Authority, on the 10th inst., it was unanimously resolved to increase the salary of their surveyor, Mr. W. Fraser, A.M.Inst.C.E., by £25, for extra services rendered, and the efficient manner in which his duties were carried out. This is the second increase in three years.

On behalf of Lady Siemens, Lord Kelvin, the President of the Royal Society, presented to King's College, on Friday, an electrical laboratory, which has been furnished with the latest appliances, under the superintendence of Professor John Hopkinson. Lady Siemens has also endowed it with a fund sufficient to maintain it in thorough efficiency. The gift is intended as a memorial of the late Sir William Siemens. Dr. Wace, the Principal of the College, gratefully accepted the generous gift.

At a meeting in Glasgow, on Friday night, for distributing the prizes and other awards gained in May last by pupils attending the science, art, and technological evening classes in connection with the School Board, it was shown that the total number presented in both stages was 3,171, an increase of 605 on the previous year's total. The number of passes, however, owing to the raising of the standard by the Science Department, had fallen by 107, the numbers for the respective years being 1,941 and 1,834. The grant earned was £2,234, against £2,661 in the previous year.

Legal.

APPEALS FROM ARBITRATORS.

THE practical end arrived at in submissions to arbitrations, as well as in contracts accepting the certificates of architects as final and conclusive, is always the prevention of litigation and the avoidance of legal proceedings. No sensible man nowadays wants to go to law about anything if he can help it; and so these methods of preventing disputes from arising by making certificates conclusive, and of settling them without litigation when they do arise by means of arbitration, are constantly growing in favour with all concerned in the great business of building. It is, therefore, very satisfactory to find the Courts of law and of appeal endorsing this view, and doing what they can to keep the parties out of that litigation into which some are so fond of entering. This sort of thing has lately happened in two recent cases that are worth passing notice. In the case of a claim against the Liverpool Corporation for compensation in regard to insanitary property, the plaintiff again came to the Court of Appeal (13th February) on the ground that, by the amount the arbitrator had awarded, it was clear he could not have followed the rule of law laid down by that Court for his guidance. The Lords Justices, however, firmly refused to go into the question of amount. They held that there was no ground for saying the arbitrator had gone wrong in point of law; while as to the facts, he had personally inspected the property, and if he had made any mistake, it was upon the facts, into which they would not enter. The Court, therefore, refused to go into his award, and so finally disposed of this case by supporting the decision of the arbitrator.

An even more important decision was that of the Queen's Bench Division in the case of "Ex parte Stevenson" (*Times*, 16th February), which arose out of an arbitration into the amount of compensation to be paid to owners of property taken under the Housing of the Working Classes Act, 1890. Under this statute the compensation is to be ascertained by awarding certificate, which is generally final. But in some classes of cases, including the case where the amount awarded exceeds £1,000 and the party claiming is dissatisfied, an appeal may be allowed. This appeal, however, can only be brought after leave has been granted by a Judge at Chambers or the Court, and upon their being satisfied that there will otherwise be a failure of justice. With such leave the claimant can submit the question of compensation to a jury. In this case some owners of property at Manchester had obtained an award of £3,000, and not being satisfied, they applied to a Judge at Chambers for leave to appeal, which being refused, they now came to the Court upon appeal from that refusal. It was at once pointed out by the Court that, if such an appeal could be brought in this case, it would also lie where leave had been granted, which could not be entertained. The Court then decided that there was no appeal given in either event, and that the exercise of discretion by the Court or Courts below upon the application for leave to appeal was final and conclusive, and ended the whole matter.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

M. B.—ARBITRATION.—DECLARATION.—There is no need for any such declaration in this case of an ordinary arbitration, and there is no requirement of the sort in the Arbitration Act, 1889, which now governs such matters, and to which you should refer.

BANGLEY.—BUILDER.—CONTRACT.—SETTLEMENT.—The agreement used by you does not contain a proper clause as to the final certificate being conclusive; and it apparently leaves the builder in a position to dispute what is owing. The best way out of the confusion will be to give him written notice that if he does not render his account within 14 days you will close the whole matter; and thus leave him to do what he can after this long delay.

TEMPUS OMNIA REVELAT.—ARCHITECT.—BUILDER.—A firm, as architects, should have refused to act in the matter except in accordance with the contract. As they did not adopt this course, the question becomes one of fact as to what did happen. A. can raise the question by an action for charges owing, and in the meantime should refuse final certificate.

RUEIL.—BUILDING.—LINE.—There are discretionary powers given in such cases. Get the local board to state their reasons for refusal. Then consult a local solicitor on the whole case. The way to proceed would be by mandamus, if the board is in the wrong.

Owner.—Drains.—Water.—Local Board.—Certainly the local authorities are bound to provide proper drains to take off the surface water, and if the houses in question are flooded solely by their omission to do this, they might be made liable.

LEGAL INTELLIGENCE.

The Fatal Fire at Battersea.—The following is the full text of the verdict of the jury in this case, which was delivered too late on Thursday, the 18th, for our last issue:—"That the deaths of Ada Gertrude Dodd and Mary Louisa Medlam were caused by burning and suffocation, in accordance with the medical report, at the fire which took place at 307 and 309, Lavender-hill, on December 19th, 1891, the deceased at the time being in the employ of Mr. Joseph Minnis, draper and dressmaker, and we find that the said fire was caused accidentally by some pampas grass with which the shop-window had been dressed coming in contact with naked and unprotected gaslights which were in the said window, and which he had been warned were dangerous by a previous fire. We find Mr. Minnis was guilty of gross negligence, and deserving of severe censure. Further, seeing that there was ample time to alarm the girls in the workrooms, his conduct was almost reprehensible in failing to immediately give them the necessary warning. That urgent legislation is necessary to compel the inclosure of gaslights where highly inflammable materials are stored or exhibited. That so far as the Metropolitan Fire Brigade are concerned, nothing more could have been done than was done, and we desire to record our confidence in Engineer Glover, who has charge of the Battersea fire station, and we consider him worthy of our commendation. Water Company: The evidence given respecting the water supplies at fires in Battersea proves that the system requires improvement, and that it is not only necessary, but imperative, that the old-fashioned fire-plugs be done away with at once, and proper fire-hydrants substituted. We, therefore, urge this upon the London County Council, and ask them to put the work in hand without delay, for the public safety of property and lives. With regard to the supply of water at the commencement of the fire, we are of opinion that Engineer Glover's statements are right, and that the seeming want of pressure was due to the kinking of the hose whilst carrying it from No. 305 to 311. We urge upon the proper authorities the necessity of thoroughly investigating the matter of exits in case of fire where any number of workpeople are employed. We consider that the Metropolitan Building Acts for ordinary buildings should be amended without delay to bring them up to the requirements of modern construction, in which ironwork is now an important factor, and that all constructional ironwork should be cased with fire-resisting material. That staircases in warehouses, factories, shops, &c., should be inclosed with brick partitions, to keep the fire from immediately attacking the woodwork of stairs. That no matchboarding should be allowed on ceilings of shops, warehouses, or factories. That where matchboarding is used to cover walls, the space between the battens should be filled in with incombustible material to prevent a flue being formed at the back of matchboarding, and that it should not be carried out to within 18in. of the ceilings. Amendment of Section 5 of the preliminary to part 1 of rules as to the thickness of walls to private houses: 'That, for the purpose of getting proper thickness to walls, rooms in the roof should be counted one story.' It should be penal not to submit plans and specifications to district surveyors before alterations or additions are commenced, and in many other respects the Metropolitan Building Acts can be vastly improved as regards alterations, additions, &c. We consider that in the matter of giving assistance during the fire, great credit is due to p.c. Evans, 478 V, and Mr. Harry Taylor; and that p.c. Kiddle, 563 V, deserves special commendation for his coolness and courage. We also consider the conduct of Miss Nellie Green and Miss Elizabeth Taylor very praiseworthy. We hear with pleasure of the improvement of Miss Davidson, and hope her recovery from her severe injuries will be complete. We, the jury, wish our sympathies and best wishes specially conveyed to her, and our sympathies are further extended to the relatives and friends of the two deceased." The coroner expressed his entire concurrence with the verdict.

In re R. Cull and Son.—Under a receiving order made on the 22nd ult. against Reuben Cull and Reuben Thomas Cull, brick and tile merchants, Palmerston-buildings, Old Broad-street, trading as "R. Cull and Son," a statement of affairs has been submitted showing liabilities £6,542, of which £5,508 are unsecured, with assets £1,518. The debtors attribute their failure chiefly to the loss of valuable agencies, and to losses by bad debts. The Senior Official Receiver (Mr. G. Wreford) asserts that proper accounts of expenses and drawings do not appear to have been kept since March 1890, and the books have not been completely balanced since March, 1889. An adjudication of bankruptcy has been made.

School Board for London v. Holloway.—(Queen's Bench Division, Feb. 22, before the Lord Chief Justice and a special jury.)—This was one of the many actions brought by the London School Board against builders and contractors to recover damages for defects in construction of schools. In the present instance the action was against Henry Leonard Holloway, builder, of Queen's-road, New Cross, to recover damages for breach of contract in regard to the construction of a school in Essex-street, Mile-end. The defendant denied the breach, and also alleged that the action had not been brought in time. Mr. Lockwood said the contract in question, which was entered into in July, 1885, contained a provision that the contractor should for four years remain liable for fraud, default, or wilful deviation from the contract. The defendant said that he had completed the works to the satisfaction of the clerk of the works, and had received a final certificate from the architect, and that the action had not been commenced within the required period. It was not until June, 1890, that the School Board became aware of any deviations, and for these they now sought to recover damages from the defendant. One complaint was that for the ceiling the defendant had used 1in. laths instead of 1½in. This was found out in January, 1890, and in the June following a thorough inspection took place, and then it was found the whole of the ceilings were defective, that the drains were not laid as required in cement, and that while in the playground there ought to have been under the tar paving a foundation of 6in. of hard rammed débris, no such débris was used. Mr. E. R. Robson, F.S.A., formerly the architect to the School Board, and the designer of the schools; Mr. Walker, the clerk of the works; Mr. John Bull, surveyor; Mr. Wm. Hy. Strudwick, surveyor; Mr. Horace Bradfield, assistant architect for repairs, and others gave evidence in support of plaintiffs' case. On the conclusion of the case for the plaintiffs, the Lord Chief Justice said it seemed that the person who stood between the board and the contractor had approved, so far as he saw, of everything that was done as being perfectly done; and then there was an allegation against the defendant of wilful default and fraud, which ought to be clearly made out. The jury gave a verdict for defendant, and judgment was entered for him with costs.

Employers' Liability. — At the Darlington County Court last week, Judge Turner had before him the action of Beale *v.* Hoskins and Hoskins. This was an action brought by a journeyman painter, who had been about 20 years in the employment of Messrs. Hoskins, decorators and painters, Blackwellgate, Darlington, to obtain £60 damages. Plaintiff was engaged in August last painting the spouting at the county court when the ladder upon which he was standing broke. Plaintiff was thrown to the ground, a distance of 30ft., and sustained severe concussion of the buttock.—For the defendants it was alleged that the accident was due to plaintiff placing the ladder too far out at the bottom.—The Judge said that to establish a claim for compensation the plaintiff must show culpable negligence on the part of defendants. No negligence had been proved, or even alleged. A verdict would therefore be given for the defendants.

Action for Damages by Vibration.—Allison v. The City and South-London Railway. — Before Mr. Justice Kekewich on Tuesday, a motion was made by the trustees of the late Mr. Spurgeon's Stockwell Orphanage, Clapham-road, to restrain the Electric Railway Company from working three engines of 400H.P., each driving dynamos, and connected with three hydraulic engines for the purpose of working the electric railway, so as to cause a nuisance by the steam, noise, and vibration of the engines and dynamos. The case was heard in June, 1891, and Mr. Justice Kekewich allowed the case to stand over to enable an engineer to inspect the property and report. The engineer, Mr. Harris, reported that the engines and dynamos did cause a nuisance, and the defendants had not done all that was possible to mitigate the nuisance. The defendants have since moved the engines further away from the orphanage, but they pleaded that they were acting under their statutory powers. Mr. Justice Kekewich said that the railway company were wrong in the first instance, but had since done all they could to mitigate the nuisance. They must pay the costs up to the end of 1891, and also £50 damages.

Action by an Architect.—Earl v. London Share and Debenture Company, Limited.—Mr. Justice Denman and a special jury heard last week an action brought by Harry Earl, an architect and surveyor, to recover damages for breach of a contract, dated February 7, 1891, by which defendants were to purchase the rights of certain patents relating to automatic weighing machines at a price of £7,700 and ten founders' shares in the company which was to be formed. The defence was that the alleged contract never in fact became one, as there was an express condition that the contract was only to take effect in the event of defendants' patent agents reporting favourably as to the novelty and validity of the said patents, and upon verification of the representation by the plaintiff that such validity had been established by a decision of the High Court of Justice. The patent agents did not report favourably, and plaintiff's representation as to the validity of the patents had not been established in the High Court. In the alternative, the defendants pleaded that if they did in fact enter into any contract, they were induced to do so by the representations made to the plaintiff as to the novelty and validity of the patents. The defendants further claimed rescission of the alleged contract, if any in fact existed. The jury found that the document of Feb. 7 was a contract, and returned a verdict for plaintiff for £2,500.

Covenants as to Height of Buildings.—Cooke v. Gilbert. (Before Lords Justices Lindley and Kay). — An appeal against a decision of Mr. Justice North, reported in our issue of last week, p. 294, was heard by Lords Justices Lindley and Kay on Wednesday. We gave the facts so recently, that it is only necessary to add that the Court allowed the appeal.

PARLIAMENTARY NOTES.

The New Admiralty Offices.—Mr. Plunket explained, on Tuesday, that the foundations for the new Admiralty buildings were completed last spring, but the invitations for tenders for the superstructure were considerably delayed owing to the strike that prevailed in the Metropolis from May to November. On the termination of the strike, advertisements for tenders for the first block of buildings were immediately published. As a result the contract with Messrs. Shillito and Sons was agreed to, and after the adjustment of the contract, orders were given to commence work. That was a week ago, and operations were now in progress.

WATER SUPPLY AND SANITARY MATTERS.

Crewkerne.—The authorities of the town of Crewkerne, Somerset, have secured the services of Messrs. Bailey Denton, Son, and North, MM.Inst.C.E., to advise them on the question of sewage disposal. It is proposed to treat the sewage of the town on neighbouring land of poor quality by means of irrigation or intermittent filtration, and thus to put an end to the present unsatisfactory state of things.

CHIPS.

Dr. Archibald Barr, Professor of Engineering at Glasgow University, lectured in the Philosophical Society's Hall in that city, on Friday evening, to a meeting of teachers on the subject of "Some Scientific Questions Concerning Pictures." The lecture was illustrated by a series of lantern views.

Sir John Lubbock unveiled, on Tuesday, the bust of the late Mr. Firth (first Deputy Chairman of the London County Council), at their hall in Spring-gardens. The bust is in marble, and has been executed by Mr. Verheyden.

At a meeting held at the Guildhall Court, Beverley, under the presidency of the Mayor of that town, last week, presentations were made to Mr. James Sharp on his retirement from the office of borough surveyor, and also to his wife.

The death is announced from Wellington, New Zealand, of Mr. John Knowles, who held the appointment of Under Secretary for Public Works for that colony from the creation of the department in 1871 until 1883. Mr. Knowles was 68 years of age.

The proposed memorial in Peterborough Cathedral to the late Archbishop Magee appears to hang fire. The proposal is for a tomb with a recumbent figure; but of the minimum of £800 required, only £570 has thus far been subscribed.

A large clock has just been erected in the Jesse Haworth Memorial Church, Walshaw, near Bury, by Messrs. John Smith and Sons, Midland Clock Works, Derby. It strikes the hours and shows time on two 6ft. dials, which are illuminated at night. Messrs. Booth and Chadwick, of Manchester, were the architects.

A receiving order and an order of adjudication have been made, on his own petition, against Mr. Charles Sprakes, of 37, East Laith Gate, Doncaster, builder and contractor (trading as Charles Sprakes and Sons).

The contributions towards the restoration of Gloucester Cathedral amount to about £4,100, the cost of the work, as estimated by Mr. Frederick S. Walker, the architect to the Dean and Chapter, being £6,000.

Our Office Table.

THE annoyances inflicted on communities by the defective draughtsmanship of Acts of Parliament are afresh illustrated by the quandary in which the county road boards of Ross, Cromarty, and Sutherland find themselves with regard to the proposal to rebuild the highway bridge at Bonar, destroyed by the recent floods. The boards are anxious to proceed at once with the work of reconstruction to meet the requirements of the traffic; but are hampered by a provision in the Local Government Act of 1889, whereby a recommendation to the county council to construct or rebuild a bridge cannot be considered before the annual meeting in October. As the county councils of Inverness, Ross, and Sutherland are all in the same position, they have written to ask for permission for the county councils to meet on a special date and give their consent to the progress of such works. Counsel's opinion has been taken on the point, and as to whether a ferry may be temporarily maintained. The reply advises the bodies to leave the provision of the ferry to private enterprise, as money could not be allocated to the purpose, nor could tolls be enforced, and that to overcome the greater difficulty as to the statutory date of meeting the only remedy is to pass a short amending Act. The various county authorities will memorialise the Secretary for Scotland to do this at once, and in the mean time will take measures for removing the wreckage and salvage of the old bridge, and make accesses on either side for the unauthorised ferry boats, which will tacitly be permitted to ply at the boatman's private risk.

A SENSATIONAL paragraph has been the round of the Metropolitan dailies, copied from a Kentish journal, to the effect that "a pronounced tendency to fall outwards has manifested itself recently in the north and south walls of Canterbury Cathedral." Dr. Payne Smith, the Dean, writes, however, to explain that these walls have for a century and more been out of the perpendicular, each leaning slightly outside, from the pressure of the roof. When a new roof was put upon the nave 40 or 50 years ago, much was done to correct the pressure; but some months ago the Chapter asked Mr. Ewan Christian to examine these walls and see if they had moved at all. He reported that they were perfectly safe and had not moved, but that it might be as well to brace them together for more perfect security. The braces, designed by Mr. Christian, are now being put into position, and will tie the two walls together. What is being done is thus simply a matter of precaution.

THE death of Mr. Henry Edward Doyle, C.B., the energetic director of the Dublin National Gallery, is a serious blow to that institution. With very slender pecuniary resources, never exceeding £1,000 a year, he has succeeded in increasing the collection in that gallery by many works of artistic and historical importance, a strong point being the acquisition of works by the Dutch masters at very reasonable rates. Mr. Doyle was 68 years of age. He had held the post of director of the Dublin National Gallery since 1869, and hon. secretary of the Irish National Portrait Gallery since 1872.

MR. THOMAS BEATY, builder, of the firm of Messrs. Beaty Bros., Devonshire-street, Carlisle, died on Wednesday week, after a very brief illness from influenza, followed by inflammation of the lungs, at his residence at Dalston. Mr. Beaty, who was 47 years of age, was widely known, having been engaged with his firm in carrying out many large building contracts in all parts of both Cumberland and Westmoreland. In order to superintend extensive alterations and additions which the firm are making for Colonel Salkeld at Holm Hill, Mr. Beaty removed some time ago from Birklands, his place at Carleton, to Dalston. While at Dalston his wife died very suddenly. He was a member of the Carlisle board of guardians, and also did much useful work upon the Carlisle rural sanitary authority. He was a prominent Freemason, and was a P.M. of the Union Lodge. The interment took place on Saturday, the deceased being borne to his last resting-place by four Past Masters of the Union Lodge.

FROM the recent report by the Board of Trade upon all railway, canal, tramway, gas, water, and electric lighting Bills and provisional orders which are being promoted this session, it appears that the number of Bills is 163, as compared with 148 deposited last session. The total amount of capital proposed to be raised under these Bills is £56,363,061, or a decrease of £1,769,529 as compared with last year. The Bills deposited by existing railway and canal companies number 86, and the new lines proposed in them show a length of 304 miles, as against 308 miles. The number of Bills promoted by new railway companies is 20, as compared with 12 of last year. The new lines proposed by these companies show a length of 146 miles, as compared with 296 miles. The total length of new tramway lines proposed in the 14 deposited Bills relating to tramway undertakings is 27 miles.

ALEXANDER JACKSON DAVIS, one of the foremost architects of the United States, a founder of the American Institute of Architects, Secretary of the American Academy of Fine Arts—now the National Academy of Design—and designer of the (former) State capitols of Connecticut, Indiana, and North Carolina, and many prominent public and private buildings in various parts of the country, died on Thursday, January 14, at his residence near Llewellyn Park, West Orange, N.J., after a short illness. He was born in New York in July, 1803, and was thus in his 89th year. In 1829 he commenced practice in New York as partner to Ithiel Town, a bridge engineer, and the firm very soon wrought important changes in the town architecture of the city; they were the first to introduce the pilaster on doorways, the bay, and oriel window. Mr. Davis worked on Palladian lines, but impressed his work with the stamp of his own character. Among his works were the Patent Office and Executive Department buildings, Michigan and North Carolina Universities, and many lunatic asylums and other institutions. He also carried out a considerable practice in landscape gardening. He retired from the profession in 1874. Mr. Davis was intimate with most of the prominent literary and scientific men of his time, and whom his deep classical and scietific learning attracted to him. His influence upon the American architecture of his own and subsequent time can never be measured. The first professional American architect, he was widely copied by many whose ability was not sufficient to originate or create.

IT is proposed to hold in Chicago, during the Columbian Exposition of 1893, an International Congress of Engineers. The principal objects of the Congress will be to enable engineers to inform each other concerning the latest and most economical practice in methods of construction and operation, machines, processes, experiments and investigations, including standards of efficiency, tests, and measurements, to compare and interchange ideas, and to discuss points of professional interest. The Engineering Congress will probably take place in July or August, 1893, and will last six days, a portion of which may be devoted to visits for the inspection of objects of engineering interest. The Congress is to begin with a joint meeting and addresses, and in view of the wide scope of engineering specialities it is then to be divided into seven general divisions, as follows: A—Civil engineering, in which several subjects of interest to our readers are, we notice, to be discussed; B—mechanical engineering; C—mining engineering; D—metallurgical engineering; E—electrical engineering; F—military engineering; G—marine and naval engineering.

THE great central hall of the Columbian Exposition is the chief feature. It has a clear area of 1,280ft.; the roof rises to a height of 245½ft. at the apex, and the span of 380ft. has a single steel arch weighing 125 tons, of which there are 22. Extending round the hall is a gallery 67ft. wide, 21ft. of which overhangs the floor of hall. It is 3,504ft. long. Beyond the gallery and round the central hall is a nave, 108ft. wide, 114ft. high to apex of roof, and of a total length of 4,119ft., and a gallery, 49ft. wide, extends round the nave The two galleries are connected by 28 bridges, 50ft. high and 108ft. long. There are 11 acres of skylight in the roof, and about 41 acres of floor and galleries.

THE 28th annual report of the Pearl Assurance Company, presented last week, announces a dividend of ten per cent. The total income for the past year was £320,405 11s. 4½d. During the same period 431,911 policies were issued, representing a new premium income of £191,911 8s. 1d. The total annual premium income was £343,914 19s. 1d.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Discussion on "The London Water Question." 8 p.m.
Leeds and Yorkshire Architectural Society. "The Architecture of Michael Angelo," by A. Beresford Pite. 7.30 p.m.
TUESDAY.—Institution of Civil Engineers. Discussion on papers by W. T. Douglass on "The Bishop's Rock Lighthouse," and, by D. C. Salmond, on "Tory Island Lighthouse." 8 p.m.
Glasgow Architectural Association. Annual Business Meeting. 8 p.m.
WEDNESDAY.—Civil and Mechanical Engineers' Society. "Practical Notes on the Water Supply of Boilers," by R. J. Friswell. 7 p.m.
Society of Arts. "Spontaneous Ignition of Coal, and its Results," by Prof. Vivian B. Lewes. 8 p.m.
Carpenters' Hall Free Lectures: "Sanitary Construction of Public Buildings," by Prof. T. Roger Smith. 8 p.m.
THURSDAY.—"Indian Sanitation and the International Congress of Hygiene," by Sir W. J. Moore. 4.30 p.m.
FRIDAY.—Architectural Association. "How They Built in Shakespeare's Time," by Alfred Gotch, F.S.A. 7.30 p.m.
Royal Institution. "The Surface Film of Water," by Prof. L. C. Miall. 9 p.m.

The Architectural Association.—March 4th, the Tenth Ordinary General Meeting at 7.30 p.m. Paper by J. Alfred Gotch, Esq., on "How they Built in Shakespeare's Time," with lantern illustrations.

March 5th, the Third Spring Visit. Particulars will be given in the BUILDING NEWS of March 4th.

ERNEST S. GALE } Hon. Secs.
F. T. W. GOLDSMITH }

CHIPS.

At Cleckheaton, near Bradford, on Wednesday evening, a high chimney, which was under repair, fell across a four-storied mill. A number of workpeople were buried under the ruins, and fourteen of them were killed, while others were injured, some seriously. The chimney was built some fifty years ago, and was 180ft. in height. It was of brick, and at the time of the accident two men, in the employment of Messrs. Moulson and Sons, of Bradford, were engaged upon it making repairs near the base.

The death of Mr. Robert Stayner Holford, the well-known art connoisseur, ought not to pass unnoticed. The collection of works of art which he brought together at Dorchester House comprises many of the finest examples of the Italian, Spanish, and Dutch schools of painting, a fine collection of drawings by Dutch masters, many invaluable illuminated manuscripts, and Rembrandt etchings. His interest in modern art was not less active than his desire to collect from older schools. He was among the first to appreciate the remarkable genius of Alfred Stevens, and he obtained his assistance in the decoration of Dorchester House, which contains several of Stevens's most important works. Mr. Holford employed the elder Vulliamy to design for him in the Italian style his country and town residences at Westonbirt and in Park-lane.

At a meeting of the council of the Royal Society of Painter-Etchers, held on Monday evening, Mr. Robert W. Macbeth, A.R.A., was elected to a Fellowship, and M. Hellon to an Associateship of the society.

One of the most important of the improvements in Stockport now being effected by the corporation is the construction of a new bridge and road to connect Chestergate with Heaton-lane, on the low level. The bridge is to be of a lattice tubular form, and of steel, having a span across the river of 80ft. The width inside between the parapets will be 54ft. Mr. A. M. Fowler, M.I.C.E., of Stockport and Manchester, the designer of the Millgate and Lancashire bridges, is the engineer.

St. Paul's Schools, Rochdale, were opened on Tuesday. The buildings include a room that will seat 500 people, and four large classrooms that can be thrown into two. Messrs. Peters and Sons were the contractors, and the cost (exclusive of furniture and fittings) has been £2,300, which was the amount of their contract. Mr. R. Knill Freeman, F.R.I.B.A., of Manchester and Bolton, was the architect, and Mr. Thomas Rhodes clerk of the works.

At the Cutlers' Hall, Sheffield, on Tuesday, Mr. Gustav Alsing, A.M.I.C.E., formerly engineer of the sewage works at Blackburn-Meadows, was presented with a cabinet of cutlery and a travelling-bag, in recognition of his services to the town. The presentation was made by the chairman and vice-chairman of the sewerage committee.

Trade News.

WAGES MOVEMENTS.

Edinburgh and Leith.—A joint meeting of the Edinburgh and Leith joiners was held on Monday in the Trades Hall, High-street, Edinburgh. A report from the Conciliation Board was submitted, embodying the draft of the working rules. A good deal of discussion took place; but ultimately it was agreed to accept them in the mean time, and to modify them afterwards in the light of subsequent experience of their working.

Plymouth.—The Plymouth Master Builders' Association have decided to submit to the men of the various building trades a proposition having for its object the adoption of uniform hours for all trades during the winter months. At present much inconvenience is caused by the fact that the carpenters begin work at 7.30 a.m., and work 8 hours, while the masons, bricklayers, and plasterers begin the day at 7, and make a day of 8½ hours; while the stoppages for meals vary. The employers ask the men to arrange so that all the trades shall begin work at the same time during the four winter months, making the eight hours' day general.

◆

In the competition for a State House for Rhode Island, U.S.A., a decision has been reached which places the designs in the following order:—McKim, Mead, and White, of New York, first; Shepley, Rutan, and Coolidge, of Boston, second; and Stone, Carpenter, and Willson third. The style of the selected design is Classic, with large memorial hall in centre, with lofty dome above.

Messrs. Holloway Brothers, of Victoria Works, Queen's-road, Battersea, write explaining that the defendant in the case of London School Board v. Holloway (reported on p. 326) has no connection with their firm.

The parish church of St. Margaret, Wetton, near Leek, is about to be restored, reroofed, and reseated at a cost of about £800. Messrs. W. Sugden and Son, of Leek, are the architects.

◆

Holloway's Pills.—These famous medicines are blood renovating remedies, whose influence reaches the great centres of the nervous system, purifies the circulation, induces a healthy state of the bodily powers, gives tone to the stomach and brain, producing a desire for food, and all the proper requirements for health and vigour.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Bermondsey.—For stables in Long-lane, Bermondsey, for Mr. Samuel Taylor. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects:—

Castle, W. and H. (accepted) ...	£3,700 0 0

(No competition.)

Bexhill-on-Sea.—For the erection of new premises for Lloyd's Bank, Limited. Mr. Arthur Wells, F.R.I.B.A., Hastings, architect:—

Barker, S., Bexhill	£3,472 0 0
Thomas, C., Bexhill...	3,287 0 0
Jenkins, P., St. Leonard's* ...	3,075 0 0

* Accepted.

Bowness.—For new bank, Bowness, for Messrs. Wakefield, Crewdson, and Co., Kendal. Mr. Robert Walker, M.S A., Windermere, architect:—

Masons' work and walling:—Atkinson Bros.
Joiners' work:—Latham and Dobson.
Plumbers' work:—Pattinson, J. A.
Plastering:—Armstrong, H. B.
Painting, &c.:—Croft, F. G.

Bristol.—For the construction of boundary-walls at the Victoria Park, Windmill Hill, for the city council:—

Yalland, T. K., Bristol (accepted), £331.
(Lowest tender sent in, the highest being £490.)

Bristol.—For the erection of lavatories on Clifton Downs, for the city council:—

Howell, E. J., Bristol (accepted), £1,115.
(Eighteen tenders received, the highest being £1,500.)

Bristol.—For the erection of the St. Augustine's Bridge, and the covering-in of the waste space above the drawbridge, for the city council:—

Krauss, A., Bristol (accepted), £19,700.
(Lowest but two of the tenders sent in, which ranged from below £17,000 to £27,000. Engineer's estimate, £19,550.)

Broxbourne.—For residence at Broxbourne, for Mr. J. Kirkaldy. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects:—

Hunt, J. A. (accepted)	£4,900 0 0

(No competition.)

LOSTOCK HALL, LANCASHIRE.—OLD HALL, PLEASINGTON, LANCASHIRE.—NEWSPAPER OFFICES AT BOLTON.—THEATRE AT CAPE TOWN.—ROYAL ACADEMY GOLD MEDAL DESIGN FOR A TOWN HOUSE.—DESIGNS FOR A PARISH HALL.—HOUSES AT PROSPECT HILL PARK, READING.

Our Illustrations.

LOSTOCK OLD HALL, LANCASHIRE.

This hall, situated about four miles from Bolton, though small in scale like Pleasington, and of about the same date (1590), is more pretentious in appearance, and is probably a fragment of a building of considerable size. The original arched entrance, of which there is a counterpart at the back, is now filled in with a modern doorway, and the sash windows, with their jambs and lintels on either side, are also modern insertions. Probably a courtyard formed part of the original plan. The building is now occupied as a farmhouse.

PLEASINGTON OLD HALL, LANCASHIRE.

This picturesque old house is situated about three miles from Blackburn, and bears the date 1587 over the entrance porch. It probably replaced a more ancient mansion, for as far back as the reign of Henry III. the manor was in the possession of Henry de Plessyngton, who gave lands to John de Stodleigh, and Margery, his wife, daughter of the above. In the reign of Edward III., Roger de Winkeley held the estate, having married an heiress of Pleasington. Subsequently the manor appears to have passed into the possession of the Cunliffe family, for in 1396 Robert, son of Adam de Cundeclif, quit claims to John de Aynsworth, of Plessyngton, and his heirs, all his rights and title in the whole manor of Pleasington. The house, with its richly-tinted roof of stone slabs, and background of foliage, makes a delightful study of colour.

NEWSPAPER PREMISES AT BOLTON.

The architects of this building, which has been erected for Messrs. Tillotson and Son (M. Tillotson and William Brimelow), are Messrs. Bradshaw and Gass, F.R.I.B.A. The design in character is Renaissance, the central portion being of York stone, with the broad side pilasters of Ruabon bricks. In the lower part are three semi-elliptical openings, with moulded jambs and arches. The centre opening contains the mahogany entrance doors, with glazed, leaded upper panels. In each of the arch spandrels carving is introduced, on the shields above the entrance archway being the letters "W. F. T.," the initials of the late Mr. W. F. Tillotson, and "1867," the date of the establishment of the *Bolton Evening News*. In other spandrels are represented Comedy and Tragedy; whilst in pilaster panels are symbols of Music, Literature, Painting, and Architecture. All this carving was executed by Mr. Floyd, of Manchester. The public office forms the ante to the main building, and is 70ft. long and 24ft. wide. The main block occupies an area of about 11,700 superficial feet, and is three stories in height. The lower story, being partially below the ground, is the principal machine-room, where all the heavy machinery is placed. A stained and varnished screen, the upper part glazed with clear glass, separates the foundry from the machine-room. Another staircase communicates directly with the first story, and gives access to the central part of the building. The publishing department for the newspapers has been placed away from the street, and the newspaper agents now congregate in the yards at the rear of the works. The second story is devoted wholly to the literary staff, the composing-room, and the general printing department. The central staircase gives access to the editorial and reporters' rooms. The outside walls of the building are constructed of brick, with stone sills and cast-iron lintels to the large window openings. These openings are filled in with fast sheets glazed with ¼in. rough plate, and have swings at the top for ventilation. The floors are of fireproof construction, with cast-iron columns and deep rolled iron girders, making large bays. Cross girders are placed on these, and a flat concrete floor with rolled iron joists in same form. Above the concrete are placed joists and boards, the whole making a very rigid floor. The roof is formed as a floor, and covered with asphalte. In the centre is a large lantern light with cast-iron arch trusses. The fireproof staircases are formed of concrete, with Doulton's patent treads. The whole of the offices and works are lighted by the electric light.

NEW THEATRE FOR CAPE TOWN, CAPE OF GOOD HOPE.

This building, designated the Grand Parade Theatre Building, is to be erected by a syndicate of gentlemen who have the welfare of the public at heart, on the Darling and Grave-street corner of the Grand Parade, one of the most eligible sites in Cape Town, kindly granted by the Cape Town municipal council at the nominal rental of £1 per annum for 99 years. Past experiences have induced the syndicate to erect, and the council to accept, a costly but substantial edifice, based on fireproof principles, and in order to assist in defraying expenses, a number of shops, offices, &c., are provided for in the building. The stage is large and lofty, and the auditorium conveniently seated and arranged for 1,200 people. The works were commenced in the beginning of September, 1891, and are to be completed in two years. The architect is Mr. G. M. Alexander, F.R.I.B.A., of Cape Town, whose designs were chosen in a selected competition, and the works are being carried out by Mr. William Kitch, of Cape Town, under the general supervision of the architect.

ROYAL ACADEMY GOLD MEDAL COMPETITION.—DESIGN FOR A LARGE TOWN HOUSE.

Last week we illustrated a view and plans of this design, and it may be now as well to mention that under the conditions it was planned with a view to the proper placing and lighting of works of art. The site to have a frontage of 70ft., with a depth of 180ft. To be lit from front and rear, and from a centre court. In this plan an attempt has been made to introduce the Elizabethan form of gallery. The stateliness and dignity of this apartment, as seen at Hatfield, Knole House, and other old country seats, renders it eminently suitable for reception occasions, as well as for the display of works of art, &c. Small areas have been avoided. The apartments are all well lighted by one large central courtyard, increasing in size as it ascends. The ground floor is reserved for the family apartments, and has been arranged with a view to comfort and convenience. The first floor is occupied by the state apartments; circuit is obtained either through the conservatory, or by the secondary staircase through the ground-floor gallery to the grand staircase again. The street front is treated in a free style of Renaissance, the aim being to get the rich effect and the fine play of light and shade of the Venetian palaces, together with the domestic character of the English Renaissance work. An endeavour has been made in the courtyard to get a picturesque effect by introducing roofs and dormers of the François I. style. Applied ornament has been avoided, the object being to get a simple but dignified effect, and expressive of the interior, by relying solely on the necessary features of the plan. Mr. Alex. Mackintosh is the author of the design.

"BUILDING NEWS" DESIGNING CLUB: DESIGNS FOR A PARISH HALL.

(See description on page 296.)

HOUSE AT PROSPECT HILL, READING.

This house was erected recently at Prospect-hill Park, Reading, for Mr. G. Philbrick, together with stables and outbuildings. The contract for the house amounting to £3,200, and the stables £375. The plans and sketches drawn by Mr. Dudley Newman will sufficiently explain the general arrangement of the house, with the exception of the second floor, which contains a large billiard-room and five bedrooms. The house is built in red brickwork, with tile-hung walls on first floor, and timber-framed gables, with brickwork at the back of same, and is roofed with Broseley tiles. The interiors of the dining and drawing rooms, hall, and staircase have been decorated in colour in anaglypta; the woodwork in sitting-room has been finished in enamel colours, and in the hall stained and varnished. The contractors for the work were Messrs. Bottrill and Son, of Reading; and the architects, Messrs. Newman and Newman, of 31, Tooley-street, London Bridge, S.E.

COMPETITIONS.

Darwen Technical School Competition.—In reply to the advertisement, twenty-five sets of plans were received. The design placed first is that of Mr. J. Lane Fox, architect, Dewsbury. The design placed second is by Messrs. Morley and Woodhouse, architects, Bradford. The design placed third is by Messrs. Dunn and Watson, architects, Bond-street, London. Mr. J. Murgatroyd, F.R.I.B.A., Manchester, was called in by the committee to make the selections.

Drummond of Hawthornden Memorial.—At a meeting of the committee, Lord Melville in the chair, held in Edinburgh the other day, it was decided to accept the design of Mr. William Birnie Rhind, sculptor, 9, Cambridge-street, Edinburgh, for the above memorial.

Sunderland.—The competition for the new Borough Lunatic Asylum for the accommodation of 350 patients, with administrative accommodation sufficient for 500 patients, at Sunderland, has been settled. A special meeting of the town council was held at the end of last week to consider the report of the referee, Mr. C. H. Howell, F.R.I.B.A., and his award, after a somewhat stormy discussion, was adopted, the first premium being awarded to "Scio," Mr. G. T. Hine, F.R.I.B.A., of Parliament-street, London; the author of the second premium was not disclosed; but the third went to "X.," Mr. J. G. Gough (Giles, Gough, and Trollope), Craven-street, Charing Cross. The estimated cost of the work is £60,000. The discussion mainly turned on the question of outlay, it being stated in the course of the proceedings that the Derby Asylum cost £123 per bed, and that the average cost of twenty-four county asylums was £162 per bed. Nine borough asylums in England gave an average of £182 per bed. Newcastle Asylum cost £200 per bed. Mr. Bruce added that Mr. Hine's design for Sunderland was estimated at £170 per bed. Thirty-three designs were submitted under motto.

Walsall.—In May last the Walsall School Board advertised for competition plans for new schools. Designs were submitted, and from these the Board selected a set, the motto of which was "Bruin." When the selected design was on view, Mr. Ellis, of Walsall, another competitor, asserted that it did not fulfil the conditions of competition or the rules of the Educational Department. The Board declined to alter their decision; but all the competitive drawings were retained for several weeks, and ultimately returned. The selected design was duly submitted to the Department, but was not approved. A second design submitted in the competition by the same author as the design "Bruin," under the motto "St. George," was, however, sent to the Department and approved. This Mr. Ellis considered to be grossly unfair, and instructed his solicitor to enter an action against the board for the cost of preparing his design. This has been done, and the case will be heard at the Walsall County Court on Thursday next, the 3rd of March.

* * *

The Glasgow Institute of Measurers have drawn up a memorandum on the Glasgow Building Regulations Bill, in which it is stated that, "with modifications, it would be a good and beneficial Act for the city," and it is suggested that the Bill should be retrospective, and that the height limit should apply to dwelling-houses only.

WAYSIDE NOTES.

THE Institute has latterly been indulging in the practice of listening to three or four papers at one meeting. There may be benefits to be derived from this method of procedure, but it certainly lacks boldness and breadth of effect. On principle the thing does not recommend itself. It is surely preferable to have one good paper than three or four insignificant essays. On Monday no less than four papers on "stained glass" were read, and the audience must have been left with ideas as to the various lecturers' views rather mixed up, like toast-and-water.

Much more business-like and practical, to my mind, are the papers at the Society. Mr. Ellis Marsland's paper on building law is a valuable contribution to the discussion of an important question. So long as amendments to the present legal enactments may mean greater power to the district surveyor to prevent actual and wilful jerry-building, all well and good; but we are becoming so subject to "grandmotherly legislation," that it is necessary to keep awake to the tendencies of the times. When it is within the power of Mr. Bumble to prevent the adoption of a urinal basin in a stable for thirty horses, unless there be an automatic flushing arrangement, then, I fancy, we are getting a bit too advanced. Amendments to building Acts should be made with a view, not only to the nonplussing of jerry-builders, but also so as to do away with petty restrictions on well-intentioned persons.

What next? The Local Government Board recently issued alarming posters throughout the country with respect to the influenza. Returning home one evening I found every convenient post and wall-space in the place plastered with bills headed "Influenza," for all the world as though the sweating-sicknsss, black-death, or Asiatic cholera were decimating the land, and doubtless frightening the inhabitants into imaginary sicknesses of all kinds. Not content with this enterprise, the L.G.B. has issued a circular, pointing out that it is possible for local authorities, under the provisions of a certain statute, to say that the rooms of the Englishman's home shall not be less than a certain height from floor to ceiling. I really think I shall turn into an anti-sanitary faddist, become an apostle of constant inebriation, and join the anti-vaccinators. We shall soon have to ask permission even to open our mouths.

Something like the following may be anticipated for the opening of the 20th century:—

Mr. Buggins-Pecksniff, architect, arrives at the office in the morning, opens his letters, and calls for his head assistant.

Mr. B.-P.: "Good morning, Mr. Goggles; have you completed the plans for Smith's house?"

Mr. G.: "Not quite, sir, we cannot get the 200 cubic feet for the larder that the New Local Government Board regulations require."

Mr. B.-P.: (after relieving himself with a little beautiful language anent local authorities in general): "What a nuisance! Can't you do away with this dust-hole?"

Mr. G.: "Impossible, sir: the vestry will not pass the plans unless there is a dust-hole shown."

Mr. B.-P.: "Ah, I forgot. And of course we cannot get the extra space by additional height, as a maximum has now been added to 10ft. minimum enforced at the end of the 19th century. How one envies the architects of those days! It is bad enough, perhaps, to have a minimum enforced; but an unalterable maximum is much worse."

Mr. G. (Thinking of his "screw"): "Quite right, sir."

Mr. B.-P.: "I really think that you might manage to do away with that break in the street elevation; that small recess is purely wasted space."

Mr. G.: "Not at all, sir. The Society for the Preservation of Able-bodied Men in Absolute Idleness has obtained a Bill compelling all frontage-owners to provide a hot foot-bath for street loafers."

Mr. B.-P.: "Confound it! And I suppose some society or another prevents our setting the building back?"

Mr. G.: "Exactly so, sir. The S.P.A.B. Mr. Smith's old cow-house was designed by Sir Horace Jones towards the end of last century, and the society threatens proceedings if the old shanty is pulled down. They consider it a unique specimen of Late Victorian."

Mr. B.-P.: "Well, well, we mustn't make our plan overlap the ground at our disposal, as I have heard the successful competitor in the great Liverpool Cathedral competition did. Some 50ft., was it not, Mr. Goggles?"

Mr. G.: "I believe so, sir; and very few people knew anything about it."

Mr. B.-P.: "Cannot we shift this place?"

Mr. G.: "Impossible, sir; the electrical apparatus now enforced by the vestry has been made to fit as planned."

Mr. B.-P.: "And I suppose the ·12in. ventilating pipes, as prescribed by the revised regulations, have been arranged?"

Mr. G.: "Yes, sir; and the ventilating electrical fan-wheel, too."

Mr. B.-P.: "Perhaps we might cut off a portion of the kitchen; it looks amply large."

Mr. G.: "I fear not, sir; we have already reduced it to the limits stated in the new Consolidated Building Act, and the district surveyor will live on the job, and be provided with refreshments at Mr. Smith's expense."

Mr. B.-P.: "Then all I can say, Goggles, is that Mr. Smith will have to do without a larder, or hang his hams on the hat-pegs in the hall."

Mr. G.: "I have an idea, sir."

Mr. B.-P.: "Out with it then, or by Sir Christopher Wren, I shall take leave of my senses! These by-laws and regulations are fast driving me mad."

Mr. G.: "Let us search the back numbers of the Building News."

Mr. B.-P.: "The very thing! Goggles, you have saved me. Let us look at the plans for small houses for the old Building News Designing Club. Those Late Victorian students were wonderful students for making 3 go in 5 twice, with something over. I think I remember some of their plans showing larder, pantry, and housemaid's closet comprised in a space of only about 20 superficial feet. Hurrah! Saved! Saved!!"

(Mr. Buggins-Pecksniff and Goggles search, and are well rewarded.)

The new Admiralty buildings are at last proceeding again. Mr. Plunket stated on Tuesday that the foundations were completed last spring; but the strike that succeeded prevented the getting-in of tenders for the superstructure. The contract for the work having been settled on the termination of the strike, orders have been given to proceed with the work. Operations are accordingly now in progress, and quite time, too, I expect the architects consider.

Why should the London County Council wish to oppose the Birmingham Water Supply Bill? It is a little puzzling to arrive at something like a definite opinion on this point. The only possible reason seems to be that the Birmingham people are forestalling us in the matter of a source for a new supply. In which case the opposition to the scheme is for a very selfish motive. If London had paid proper attention to the question years and years ago, it might have been in possession of all the distant sources of supply, or at least have kept to itself the choice of such when the time came for definite action. Peradventure Birmingham has taken its idea from some old scheme proposed for London's new water supply, in which case it should be *seniores priores*. London should lay claim to the sources in question, and the County Council would be doing right in taking the line of action described by Sir John Lubbock at the last meeting.

I trust that architects will make a good show of garden plans, &c., in the forthcoming Horticultural Exhibition as advertised by you last week. Architects should aim at establishing a reputation for being good gardeners, from a pictorial and artistic point of view; and this may be done if no attempts are made to foist peculiar fads on the garden-loving public. I make this suggestion because I have lately seen more than one architect's name of repute associated with pictures of such a howling wilderness of clipped hedges and shrubs as cannot be reconciled with any principles of gardening, formal or informal, modern or old English. A man who would cut God's trees into cubes, pyramids, and fancy figures is surely capable of any artistic outrage in pictorial, architectural, or horticultural art. To render the hideousness of this treatment more apparent, pictures and photographs are the best means in the world, and yet we have had not a few such put before us as examples. Goth.

Engineering Notes.

Compensation for Subsidence at Greenock.—The first of a series of claims against the Caledonian Railway Company for compensation for damage in respect of subsidence caused by the construction of Newton-street Railway tunnel was brought before Mr. Lowson Walker as arbitrator on Monday. Mr. Thomas Jamieson, builder and joiner, Greenock, is the claimant in the present case, and he represents that his property, situated at the corner of Robertson-street and Newton-street, has sustained damage amounting to £1,087. The arbiter will give his decision in a few days.

Heywood, Lancs.—The town council of Heywood, near Bury, formally inaugurated on Wednesday week extensive additions and alterations just carried out at their Gasworks at Hooley Bridge. They include a new gasholder, constructed of wrought iron, the inner lift being 49ft. 6in. diameter by 16ft. deep, and its holding capacity 64,000 cubic feet. The guide standards are of wrought iron 34ft. long. The contract for the holder was placed in the hands of Messrs. Newton, Chambers, and Co., Thorncliffe Iron Works, Sheffield. The tank is 52ft. diameter and 16ft. deep. A new boiler-house has been erected between the retort-house and the sulphate works. It is 39ft. long, 29ft. wide, and 16ft. high. The walls are faced with Platt's stocks, relieved with panels and oversailing courses. The contract for the boilers was taken by Messrs. Thomas Hill and Sons, of Heywood. The chimney is 65ft. high, and is panelled and faced with Platt's stocks and coped with stone moulded and shaped cornice. New engine-houses are erected on the site of the old engine and boiler-house. The building contract was placed in the hands of Mr. James Berry, of Heywood. The plans and specifications for the new works were prepared by Mr. James Diggle, borough engineer, under whose superintendence, with the assistance of Mr. Watmough, the gas manager, they have been carried out at a cost of £3,000.

Peterhead.—The annual report of the progress of Peterhead Harbour Works states that 416 cubic yards of masonry had been added to the South Breakwater Pier, at which also 640 square yards of pitching had been laid, and 430 yards of permanent way. The output of stone at the quarry has been 20,590 tons, that having been the quantity required to meet the demands of the works. The daily average of men employed is 127 free men, 142 convicts, and 18 warders.

South-Eastern Extension to Chatham.—The extension of the North Kent Railway from Strood to Chatham, to be opened on Tuesday next, is a useful addition to the South-Eastern system, as it gives a shorter route by three-and-a-half miles than the London, Chatham, and Dover line, and provides a more central station for Rochester, Chatham, and Gillingham. The new line is about 1⅛ miles in length, and is carried for the whole distance on a viaduct consisting first of brick arches on either side of the new iron bridge over the Medway, 670ft. in length. It crosses the goods yard of the London, Chatham, and Dover line on iron pillars, and thereafter is supported on wood piling over the Common to the terminus at Chatham. The bridge over the river is a lattice girder construction, carried on piers with four navigation openings of 104ft. and 170ft. The piers are formed of iron double cylinders, and in horizontal sections 16ft. by 36ft., sunk in the usual way by extraction of materials, and subsequently in-filled with concrete. The piers are carried down to the chalk, which is attained at 60ft. from high-water datum, the rise of tide being 16ft. The total cost of the works of the new line is about £171,000, of which the bridge has absorbed £71,000. There is a station also at Rochester. The works have been carried out from the plans of Mr. F. Braby, the engineer to the company.

Mr. Alex. R. Stenning, F.R.I.B.A., F.S.I., of 121, Cannon-street, has been elected surveyor to the Worshipful Company of Cutlers.

FLOOR AREA AND CUBICAL SPACE.

A COMMON misconception prevails as to the value of capacity or space in buildings. In the following remarks we do not propose to enter into any mathematical or abstruse views of the question, but merely to point out the importance of the two elements of area and cubical capacity as they affect buildings. The principal way in which the ordinary architect and builder regard the matter is that space is an element of cost beyond which they do not care to go. To them the cubical contents is a matter of £ s. d., and the object of the promoter or builder of residential flats, hospitals, or houses is to reduce as far as possible the cubical space contained within the walls and roof. This consideration for economy is certainly not reprehensible. It is wasteful to cover in more space than absolutely required for the number of inmates, but this view of the question is not the one which concerns us now, nor does it rightly represent space as open. The estimator's cubic foot is a merely arbitrary unit of cost, and depends mainly on the intricacy and amount of workmanship of the structure which fills and incloses the space, for we may readily understand that the larger the empty space inclosed, as that of a great shed or drill-hall, the lower the price per unit. It is not, in fact, the air space, but the class of structure inclosed, and, therefore, we see how unscientific and incorrect is the assumption that cost increases in proportion to the cubic capacity of a building, an idea which appears prevalent even among professional men, who, in reducing the size of their buildings, imagine they are reducing cost *pari passu*, whereas, in fact, there is no definite relation between cost and space.

The other view of cubic capacity which regards it as space, the quantity of air contained within a given cube is of more consequence as it concerns the accommodation and health of inmates. In this sense we have a direct relation between space and health. Yet we find much misunderstanding current. The size of a room or its floor area is considered the chief requirement. Accommodation is regarded as the principal thing; thus, if a sleeping room or ward is large enough to provide so many beds, however low it may be, it is concluded that it is spacious enough. The consequence of this opinion is that often the ceiling is so low as not to allow sufficient air space for the inmates. Thus, if we allow for each bed 6ft. by 10ft. = 60ft. of floor area, and the height of room is only 7ft., it will give only 420ft. of cubic space, which is much less than is desirable for persons in a sickly state of health. The Local Government Board state that the minimum amount of space per bed for sick persons in sleeping wards is 600ft., or a floor space of 60ft. by a height of 10ft., a cubical space far in excess of many of the rooms let out for sleeping accommodation in London. A strong temptation exists amongst builders to cut down the height of rooms, though in so doing they diminish the breathing space, and to that extent reduce the number of individuals who can dwell in them, In this sense every room has a certain height which becomes necessary from a sanitary point of view. What this height is will depend on the dimensions of the room, or the number of persons which it can comfortably hold. For it ought to be clearly understood that a room only accommodating two persons comfortably ought to be quite as high as one accommodating a dozen, if the breathing space of each individual is to be equal. Shortly stated, if hygienic laws only are consulted, the small room requires a relatively greater height than a large one, and will be in direct proportion to the superficial area per individual. Suppose we take as the unit of cubic space 600ft. per bed (or 6ft. by 10ft. floor, and 10ft. height), a room of 12ft. by 10ft. would be large enough for two beds, and we should simply have to double the area for a four-bedded room; but if the same space had to be provided in a room of half that area, it would have to be double the height, or 20ft. Other things being equal, the smaller the superficial area of room, the greater must be the height, and *vice versâ*.

The hygienic law above expressed is not observed in the majority of buildings, for we generally notice that small rooms are low-pitched, while additional height is given to large ones. This law of proportion is dictated by architectural considerations, which do not necessarily clash with hygienic conditions. The chief point is to adopt a rule as to height of rooms like dormitories and sitting-rooms, which should be adequate to give the cubic space required. There is a minimum limit, beyond which the architect may go if he desires imposing proportions. All we need point out is the relation that should be kept in mind between the floor area and the height if ample air space and ventilation are to be insured. All height or excess of space beyond is a question of architecture. An excessive height is useful in a public hall or assembly-room, where sometimes a crowd collects; but for ordinary sitting-rooms and offices it requires a large heating power to render the air tolerable in cold weather. Besides, a large space of air above the head often creates cold currents, and may become stagnant and unfit for respiration. One authority has pointed out the uselessness of any greater space than can be cleared of its air every hour or two by ventilation, an argument that may be used against excess of height in wards of hospitals and in dwellings for the poor. The question bears very intimately on the construction of ordinary dwelling-houses. Speculative companies and builders have been trying to get as many stories as possible within a certain limit of elevation, and to interpret the term "topmost story" to suit their own convenience. With regard to the height of the topmost story and sleeping rooms, it has been the practice to reduce it to an extreme limit. In London, the height of habitable rooms under the Act is generally fixed at a minimum of 7ft. Every such room constructed in the roof of every building is "to be at least 7ft. in height from the floor to the ceiling throughout, not less than one-half the area of such room," according to sect. 23, a rule which practically makes the room only available for half its area. In other towns the rule appears to vary. By the by-laws recently made for Manchester, any dwelling or sleeping room not in the roof is to be at least 9ft. in height in every part, and every such room in the attic, or roof, is to be "7½ft. in height at least from the floor over one-third the superficial area of such room." This rule gives, too, a very inadequate space for sleeping, as only about a third of the room is available. By the memorandum issued by the medical officer and architect of the Local Government Board under the provisions of the Public Health Amendment Act, 1890, sect. 23, and of which we gave the gist in our last issue, it will be seen that the minimum height for rooms in general is to be 8ft. over the total area of room, and for those under the roof in which sloping rafters occupy a portion of the area a mean height of 8ft. is to be observed. Even this rule will not prevent overcrowding by placing low bedsteads under the sloping roof where the wall has to be a minimum height of 5ft. According to the diagrams published, the mean height of 8ft. for attic rooms is obtained by regulating the horizontal part of the ceiling. In the first example given, one-half of the ceiling is made 9ft. high; in the second, three-fifths are made 8ft. 9in. high; in the third example, five-sixths of the flat ceiling are made 8ft. 4in. high; in each case the sloping part of the roof is so adjusted in proportion to the horizontal portion as to give an average of 8ft., but in all cases the height of 5ft. is required for the walls from which the sloped roof springs.

Fortunately the Public Health Amendment Act, 1890, gives power to make by-laws as to the height of rooms used for habitation, and it would be desirable, if sanitary authorities saw fit, to fix the minimum for attic rooms at 8ft., or even, as our correspondent Mr. Fraser, of Llandaff, proposes in another column, as much as 8ft. 6in. It appears necessary, therefore, that in sleeping rooms a minimum height should be determined with reference to the number of beds to be accommodated, as the desire is to overcrowd rooms of large area in towns. As Dr. Russell, the medical officer for Glasgow, has shown, the room represents a uniform scale of space, and the death-rate is found to advance, *pari passu*, with the number of persons per room.

UNSTABLE CHIMNEYS.

THOUGH we are constantly being reminded by shocking catastrophes to structures causing serious loss of life, we are generally behind-hand in applying vigorous measures of prevention. The warning comes too late, we are wise after the event, and again drifting into apathy are as unprepared for the next emergency. So the mischief is repeated. The other day we were startled and shocked by the sudden fall of a chimney, which destroyed a factory and many lives at Cleckheaton, repeating in its suddenness, and almost in the extent of its horror, the disaster at Bradford in December, 1882, when the Newlands Mill chimney fell, causing the death of upwards of 50 persons, and serious injury to about 150 more. It would have been imagined that, after the fearful loss of life caused by the collapse of the Newlands Mill chimney, the warning would have been heeded, and some practical measures taken to insure the safety of all chimneys of great height that would have rendered another disaster of the kind impossible. The Newlands Mill chimney was 240ft. high, and the evidence at the time showed that its fall was partly due to cutting, aided by a strong wind; that the structure had been in an unsound condition; and that it had been "straightened" some years before. In one place the shell of masonry had left the "hearting" of rubble, which was 5ft. thick, coarse and fractured, and the "through" or bond stones were broken. Other defects were pointed out at the Board of Trade inquiry. At the Cleckheaton mill precautionary measures were being carried out, and repairs were actually in progress when the chimney fell; indeed, from what we read, some misgivings as to its condition were entertained, for the proprietors asked the workmen engaged whether the structure was in any danger, and received a reply in the negative. In both these cases no danger was apprehended; the owners had done all in their power to render the structures safe. We have, therefore, to look rather to the circumstances of the building of lofty shafts, to the condition of the law under which they are erected, at the regulations that are in force. In the Bradford case Lieut.-Col. Seddon reported that beyond fixing the minimum height for factory chimneys no regulations were in force at Bradford or Leeds to insure their safe construction, and suggested that some regulations like those in the Metropolis are required. In his official report he attributed the fall of this chimney to the damage done to the structure in the operation of straightening many years previously by cutting slices out of the shaft on the opposite side to the leaning, which process, of course, caused the joints of masonry on the opposite side of shaft to open, which ought to have been filled in by wedging. The rocking mass of over 2,000 tons in the course of years weakened this portion of the shaft between the cuts in the masonry, and caused the collapse. We have, as things are, no reliable assurance of the structure or history of these tall chimneys, whether they have been constructed according to approved principles under proper supervision, or in what manner they have been tampered with by chimney straighteners or subsequent alterations. What is necessary is a by-law regulating their construction in the first instance, and providing that all future repairs or straightenings should be done under local authority, so that the whole record of these structures should be under control. Of course, such a record can only be maintained by periodical inspection undertaken by a Government inspector or local authorities. In very many cases these structures, as in the case of Newlands, are bad in design; in others the process of straightening has weakened them, or repairs have been made tending to weaken the structure. When we consider that all lofty chimneys rock during high winds, and that a severe gust may at such time cause a structure to lose its equilibrium and be overturned, it is imperative that the outer shells of masonry or brickwork should be perfectly sound. The local by-laws in operation in the manufacturing districts of Lancashire and Yorkshire are insufficient to meet the requirements; they do not insure a periodical inspection of erections of this kind, or a careful supervision of repairs when they become necessary. After every severe gale chimneys should be inspected, those especially which have been erected many years, and which have shown indications of weakness.

THE WILES OF THE HEATING CONTRACTOR.

ONE of the hardest things an architect has to do is to get his buildings properly heated. That is, if they are public buildings such as churches, town halls, or concert halls. Dwelling houses, which depend for warmth mainly on stoves, and only in a secondary degree on hot-water pipes, are more easily dealt with. But when we come to larger works, a book might be written—and an amusing book, too—on the tricks and the blunders, the shuffles and the dodges which the architect who means to do his duty has often to contend with. Often, not always, for the trade of heating engineer, like most others, contains many honourable and honest practitioners. Yet, as competition increases, one cannot but fear that they are becoming a smaller and smaller minority. It is as much to their advantage as to that of the public in general, that the ways of their unscrupulous rivals should be exposed, so that every one who has to deal with them may be on his guard, and know what to expect.

It was under the pressure of competitive tendering, perhaps, that Mr. Wriggle (as we may call our typical specimen of the shady heating engineer) first developed his peculiar system. But having once got hold of it, he finds it far too useful to be kept only for emergencies. When his contract is low in price, it saves him from loss, and when it is high it doubles his profits. Yet there are times and seasons when prudence forces him for the moment to modify it a little. Nobody can get along without some rag of a reputation, and once in a while even Mr. Wriggle thinks it expedient to do what he contracted to do, and to turn out a piece of work which he can point to as satisfactory. Let us first watch his course in one of these exceptional cases.

He takes his contract at a reasonable price—not very high, and not very low. It is in a town where business is brisk, and where he may hope for future commissions. In such a case there is every inducement for a man to do his best, and to make his scheme a thorough success. The scheme, too, is entirely his own. The arrangements are left to him, and the one thing he has to do is to make sure that the heating apparatus will raise the internal temperature, say, 25° above that of the outside air whenever the latter is at or below 40°. This is specified to be done without overdriving the apparatus; the testing is to be done by the heating engineer and at his expense, and the ventilators are to be closed when it is going on. The boiler is to be fixed on the floor of the chamber provided for it in the basement. A certain part of the contract money is not to be paid till the architect has certified that the conditions have been fulfilled. It all seems clear and plain enough; but the people most concerned do not yet know the resources of a Wriggle.

Mr. Wriggle's men have not been at work long before they discover that on his scheme the pipes fall where they should rise, and rise where they should fall. As the water would not circulate at all under these conditions, he makes a munificent offer to the owners of the building. If they will do, at their own expense, all the extra digging and brickwork and trench-making which the alteration involves, he, on his part, will put his pipes the right way up instead of the wrong. Of course, he does not say that the scheme will break down utterly unless it is altered; he states the matter in a more attractive way. If the alteration is agreed to, there will be so much more heat, and a much quicker circulation, and a more satisfactory state of things altogether. Tempted in this way, the contractees agree to what he wishes. He proceeds a little further, and then finds that the boiler-room is not quite high enough for the peculiar form of boiler he intends to use. Without consulting the architect, he has the floor lowered—of course, at other people's expense. Then he puts in the boiler, in happy ignorance that he has sunk it below the sewer level, and that in every storm the ground-water will rise and put out the fire.

The work is finished, and the winter comes on. The apparatus is no sooner wanted for use than it proves a failure. The architect goes down and tests it. Instead of raising the internal temperature 25°, it barely raises it 12°. The architect reports accordingly to Mr. Wriggle. That gentleman explains that, according to contract, he was only bound to produce a rise of 25° when the external air was at or below 40°, whereas when the architect conducted the testing, it was at 42°. This difference of 2° outside, Mr. Wriggle explains, will fully account for the deficiency of 13° inside. This the architect refuses to admit, but takes advantage of a sharp frost to ask Mr. Wriggle to go and test for himself. Mr. Wriggle declines to do so. He says the walls are damp, and no fair test can be made for two or three years. He winds up by asking at once for the balance of his contract money. The architect points out that the contractor, according to his contract, has to test within six months of completion. Mr. Wriggle writes back to say there is a crack in the ceiling, and no fair test can be made while this exists. The answer is that the crack was stopped months ago, and that the ceiling is quite sound now. Then Mr. Wriggle complains that the boiler-flue does not draw properly. As it is 70ft. high, and 18in. by 14in., and as there are plenty of people to testify that the draught, which can be examined at the soot-door, is strong enough to carry a man's hat up, this excuse has to be abandoned. Mr. Wriggle now says he is informed, on good authority, that there is dust on the pipes. No pipes will throw out heat when there is dust on them, and until the dust is removed, he declines to test. The pipes, which had about as much dust on them as might be produced by a man walking quickly along them and shaking a pepper-cruet, are cleaned, and again the temperature is tried. There is, as might be expected, no difference, even of half a degree. Then Mr. Wriggle declares that he does not believe a word about any deficiency of heat, and that he will not go down to test the apparatus unless his expenses are paid beforehand. But, to avoid unpleasantness, if his balance is sent him by the next post, he will return £5, on condition that he is released from all further liability. The architect writes back to decline the offer, and to assure him that the heating is really a failure; and he replies by threatening the architect with a prosecution for libel.

By this time the winter is nearly over. The occupants of the building have spent three months in misery and discomfort, while Mr. Wriggle has been giving one reason after another for not doing what he undertook to do. Now the wet weather comes on. The water rises in the boiler-room, and threatens to put out the fire. If any heat is to be kept up in the building, the floor, where Mr. Wriggle sunk it, has to be pumped dry, day and night. The proprietors' patience is exhausted, and they give Mr. Wriggle formal notice that they are about to call in somebody else to set the work right, and will pay him for doing so out of the balance. Mr. Wriggle comes down at last, sees that they are in earnest, tests the apparatus, and caves in. He does then what he ought to have done at first, and finally leaves it in something like working order.

The case is otherwise when he is dealing with weaker people. He goes through the same series of performances as in the other case, except that the *finale* is different. There is his usual deficiency of twelve or fifteen degrees, to begin with. Then, in his accustomed order, he attributes this to the crack in the ceiling, the damp on the walls, and the dust on the pipes. He condemns the boiler flue, as before. He explains that it is impossible to make any sort of test if the external temperature happens to be a few degrees above that specified. If he can manage to avoid testing during a frost, this serves him with an excuse to postpone the test all through the winter, and again from one winter to the next. He then denies that there is any deficiency of heat whatever, and threatens the architect with his customary action. He makes his usual offer of five pounds to be released from all liability, and when it is not accepted he threatens to issue a writ for his balance. Nothing succeeds like impudence, and impudence, as often as not, brings Mr. Wriggle bravely through his failures. But the result that is satisfactory to him is simply ruinous to the architect and the building owner, and the first question that both of them will ask before they accept a heating tender in future will be, whether or not it comes from a member of the great family of Wriggles.

SOMETHING ABOUT CHIMNEYS.—II.

By F. DYE.

IT can be very readily understood that as the draught, the up-current in a chimney, depends entirely upon the air and gases which enter being heated, and the chimney itself being warm (as explained in the last paper), that any form of grate or fireplace which admits of a free ingress of air which is not acted upon by the fire at all, and enters at its coldest temperature, must go to lessen the efficiency of the draught, though not necessarily to ruin it.

It sometimes happens that we can well afford to slacken the draught in a chimney. With a close stove, if properly fixed, it is almost always necessary to close the damper to some extent, or the fire would burn much too fiercely. We, however, can never afford to reduce the passage of air through the fire to such an extent as happens with the old pattern open range, or with the dog-grate. With these two appliances the proproportion of air (cold) which passes into the wide-open mouth of the chimney without being affected by the fire is quite out of proportion with that which is heated, and ill results consequently ensue. If we take the average open range (and there are very many still existing in large resisidences in London as well as in the country), we find that there is a 24in. to 28in. space between the top firebar and the chimney-breast above it. If this space is left open, the smoke from the fire will show great reluctance to pass up the chimney, and in quite 80 per cent. of such cases some of the smoke will ooze out into the kitchen, and the range is said to smoke. The remedy for this state of things is the introduction of a blower, a sheet of metal placed so as to reduce the space just referred to, and the inflowing air is caused to come more within the influence of the fire. This is effectual for the simple reason that it prevents or, at least, reduces the free passage into the chimney of air that is absolutely cold. As just stated, the capacious mouth to the chimney with an open range permits of such an unreasonable inflow of cold air, that the chimney itself is chilled, and the presence of the cold air greatly interferes with the warmed air and gases that are really making an effort to travel in the right upward direction. The introduction of a blower (of sufficient depth) across the opening causes the inflowing air to come nearer the fire as it passes in, and so more of it becomes rarefied, sufficiently so to make the up-draught strong and to successfully overcome any resistance caused by the lessened quantity of cold air that now enters.

An instance once came to the writer's notice in which one of these old-pattern ranges had to be retained in the kitchen, although it was noted for its rarely ceasing its, till then, incurable habit of smoking. An ordinary blower was of no avail—that is to say, it did not wholly remedy matters, although it effected a little improvement. An effectual cure was made in this case with a specially-made blower, which reached down to the level of the top fire-bar as Fig. 3.

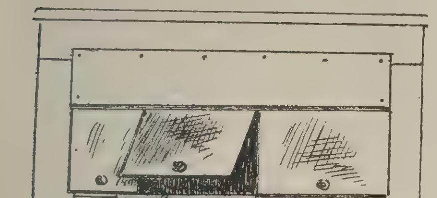

FIG. 3

This had its lower part in sections which could be raised to admit of the introduction or withdrawal of the cooking vessels. It will be seen that by this arrangement the open range was almost converted into a close-fire kitchener, so far as its shutting out cold air from the chimney was concerned.

It must not be forgotten that when we increase the efficiency of the draught in a chimney the keener passage of air through the fire makes the fuel burn more briskly; this causes a greater heat to be evolved, and consequently a small fire will do the work of a larger dull burning one. This more perfect combustion of the fuel is also economical in another sense. The smaller the quantity of soot in a chimney the smaller the quantity of fuel wasted; for soot is nothing more or less than unused coal. The open range is undoubtedly the pioneer as a soot producer, and in many ways it is a barbarous contrivance for present-day requirements. Although there is a slower rate of combustion in the fires of these compared to close-fire ranges, they are the more extravagant, for to get results at all effective for any purpose, a quantity of fuel some six times as great as is required with the latter appliance must be got into a brisk state of combustion. A small fire is of no use in an open range; one reason alone is sufficient to account for this—viz., that without a draught through the fuel the coal must be in a fairly large mass to maintain itself in a state of combustion at all. Occasionally the blame for open ranges smoking is attached to the shape or size of the chimney. It is, however, exceedingly rare that this is the cause of the trouble. In the majority of cases, if a piece of paper or wood is fastened across the top of the opening (to form a deep temporary blower), it will be found that the smoking trouble ceases, and the chimney will do its work in a normal manner.

With dog-grates the smoke trouble, when it occurs, is caused by precisely the same conditions as with the open range. These grates are usually fixed in a roomy opening which is tiled round, and the result, so far as appearance is concerned, could not be better. The spaciousness of the opening is, however, what ruins the efficient working of the chimney and the grate, by reason of the abundant presence and inflow of cold air as just lately described.

It is rather an odd thing that blowers are not applied to these openings, to obviate or cure the sluggish action of the draught in carrying the smoke away. The writer does not remember seeing one, yet the idea is very feasible. It would not be necessary to use a tin contrivance like that which is adapted to the openings of open ranges. A brass, or better still, glass strip would do just the same, as Fig. 4. With glass either a piece of bevelled plate, or ordinary sheet in a brass frame, or coloured leaded glass would look and act excellently. This would overcome, the smoking assuming it proceeded from the cause under discussion (and this is most probable); but it would not make the grate any more effective or economical, and certainly these firebaskets are as primitive in this respect as the old open range. The dog-grate, however, and the mode in which it is fixed, gives every opportunity for the display of artistic effect. Enough has now been said to make it clear what the governing principles are with draughts in chimneys, and a new subject can be entered into.

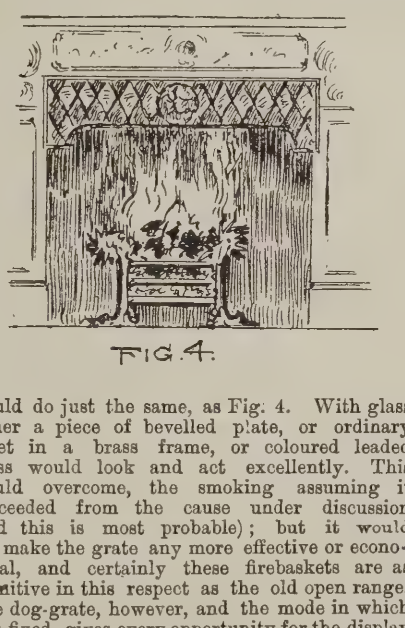

FIG. 4.

PIPE CHIMNEYS.

No one can deny that for certain purposes a great convenience is effected by the use of sheet-iron pipe for the conveyance of smoke from a stove, or from a portable cooking-range, &c., in instances where a brick chimney is not conveniently near. It may be that the pipe is carried the whole way as far as is necessary for it to constitute a chimney of itself; but more often this pipe is used to connect the stove with some existing brick chimney not far away; in the same or next room, perhaps.

As an instance, let us suppose a fair-sized stove is obtained, and, to get the fullest and most equable results, it is decided to stand it in the middle of the room. This is a plan commonly adopted in schoolrooms and shops, with good results, as no heat is lost. All parts of the place get heated more equally than if a stove or grate is at one end of the room only, and the heated pipe itself goes to increase the temperature. In such a case as this, a sheet-iron pipe is carried from the stove to the brick chimney which doubtless exists in the room, and this is all that is necessary, provided it is done correctly.

It is considered a very simple matter to fix up a stove in this way: we have to provide a suitable non-inflammable base, fit the pipe on the nozzle of the stove and carry it to the chimney-breast, there inserting it in a hole prepared to receive it. The simplicity of the job is correct provided the workman knows his work; but, strange to say, there are more blunders made in erecting a few pieces of sheet-iron pipe than one would first imagine. In the first place, as to the size of the pipe. It is important that it be large enough, and numbers of failures have been due to error in this direction. The writer has never yet known an instance in which pipe of too large a diameter has been used, and he feels a deal of confidence in saying that no one else has; but the reverse is far from being the case.

It might be supposed that the person erecting the work would choose the size of his pipe by the size of the nozzle on the stove; but this is not always done. In one instance a fair-sized stove was fitted up, and the makers had provided a round nozzle of 9in. diameter at the back, this size being quite necessary, as the stove was one that could be converted from close fire to open fire, and *vice versâ*. These convertible stoves require full-sized chimneys, as if the fire were always open; it is to all intents and purposes an open grate, and every builder provides a 9 by 9 flue for these at least. In this the fitter, instead of using a piece of 9in. round pipe to connect the stove with the brick chimney, actually had a sheet-iron reducing piece made to fit on the 9in. nozzle, and made use of a length of 4in. cast rain-water pipe for the connection. It is needless to say this was an utter failure. There was no excuse for the man whatever, for the chimney was only a few feet away behind the stove. When pipe has to be carried any distance in conspicuous places, it is common to use the smallest pipe that dare be erected, as the larger the size the more unsightly the whole affair is.

This man fell into an error that seems to be unfortunately very prevalent amongst workmen —viz., that smoke pipes need never be large. His only defence was that he did not know the stove required a large pipe. Nothing could be more incorrect, for what is a 9in. pipe equal to after all? It is of the same area as an 8in. by 8in. square chimney, and every builder puts this or a larger size for his smallest attic fireplaces. Nothing less than a 9in. pipe should be used for stoves of fair size.

Stoves that are always closed—that is to say, cannot have the fire opened except for feeding or stoking—can generally be worked successfully with a smaller-sized chimney (whether pipe or brick) than open grates, but of course a man should never fall into the error of making his chimney of less size than the nozzle provided on the stove by the maker. With stoves, the whole of the air passing into the chimney has to pass through the fire and become heated and rarified. This by itself is sufficient to bring about a keen draught. Further than this, there is a total exclusion of cold air, and so the chimney itself is not chilled; and altogether, we as a rule get a draught with a stove that needs to be checked and controlled carefully by means of dampers. Now, the keener the draught the less size the chimney may be to work effectively. This explains why stoves may have smaller pipes, when of the close description, than any form of open grate or convertible arrangement, which permits air to pass into the chimney without being heated.

With any form of stove that is of a portable character, fixed out in a room, but works with an open fire (under the conditions of an open grate), the pipe that may be used with it should never be less than 9in., and even larger than this is necessary if the stove is actually of large size. They really should have pipes equal in size to the chimneys provided by a builder when he builds a house—viz., 9 by 9, or 14 by 9 square.

It is not actually rare for it to be discovered that the nozzle provided on a stove by the maker is too small—not too small for ordinary conditions, but tending to make the stove work inefficiently when the chimney to which it is connected is a sluggish working one. From various causes, chimneys are sometimes rather wanting in draught (as will be referred to presently), and in one instance the writer converted a poor-working stove into an efficient one by drilling off the nozzle provided on the stove and substituting a larger one, which was made in wrought iron and screwed on.

It must not be thought that an occurrence of this kind is at all common, and great care should be used, and every possible remedy tried, before resorting to this. In this case, however, the chimney was old and faulty, and the draught was poor. As already explained, the less keen the draught, the larger the smoke-way (the chimney) must be, and it is no good having a large chimney in this way if it is choked at some point. In this instance the brick chimney was roomy enough, but the nozzle on the stove was only 5in. A 5in. pipe would have been barely large enough under any circumstances, but, to make matters worse, the nozzle-opening had some projecting pieces cast in it, as Fig. 5. These were provided to prevent fuel working into the flue, for the stove was one of the kind that could be filled right up with coke to last a number of hours without attention. These projecting pieces reduced the passage through the nozzle to an area of 12sq.in. This would be about the same as making a clear nozzle of 4in. diameter only. Makers might well make the nozzles larger, it would be practically impossible to make them too large, and, up to a certain point, the stoves would be decidedly benefited. If an instance occurred in which the pipe had to be carried very conspicuously, it would then be time enough to reduce the size to the least limit by means of a reducing piece.

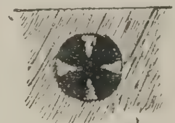

FIG. 5.

A correspondent has called the writer's attention to an error, or, rather, a blunder, he committed in Art. I., in having described the atmosphere as being composed of two gases—oxygen and hydrogen—in a state of chemical union. This mistake is really inexcusable; but the writer would like to explain that he must have fallen into error through his intention of showing how experiments could be conducted with water, for the description he has given of the atmosphere applies to water exactly.

The atmosphere is composed of two gases—oxygen and *nitrogen*—which are not in chemical union, but in a state of admixture. The writer regrets this mistake exceedingly.

NOTES ON TERRACOTTA.

DRYING.

TERRACOTTA, unlike bricks, cannot be dried in the open air by the influence of sunshine or by natural air currents, the risk being too great, and the progress too slow. In this respect we differ from the ancient Egyptians, of whose work much was sun-dried and never baked. The difference lies in the equable climate and dry atmosphere of Egypt on the one hand, and the variable climate and humid atmosphere of England on the other. Warmed air or artificial heat has, therefore, to be resorted to. There are two methods—one by the use of exhaust steam; the other by radiation. In the former 1½in. to 2in. steam-pipes are carried round the drying sheds, either at the floor level or a few inches above it. In the latter case they are fixed to the walls and intermediate piers, if the shed be a large one subdivided into smaller ones, with necessary provision to facilitate expansion and contraction, and repairs of defective joints. It is always advisable not to bury the pipes in the floors on account of the extra expense of doing so, the loss of heat, and the difficulty of getting at them in the case of repairs or alterations. Racks are used for the drying of small wares; in these the steam-pipes are carried round the walls at varying heights to suit the levels of the racks. Sufficient exhaust pipes at suitable points should be provided to prevent back pressure on the steam-engine, and to reduce the friction that would otherwise be increased between the inside of the pipes and the exhaust steam. Before placing the terra-cotta blocks in the drying shed, it is well that they should at least stand a clear 24 hours in the moulding and finishing room, to admit of their surface moisture being taken up by the process of ordinary evaporation before subjecting them to an abnormal heat, with the possibility of development of fine surface cracks. There need never be any difficulty in the way of this, for the moulder has generally a sufficient number of blocks in hand requiring finishing after they have left the moulds to make this delay of their transmission to the drying shed almost a necessity. The phrase "abnormal heat" is used in the above lines with some latitude, for in terracotta works generally there is at all times a more or less degree of warmed air present throughout the building. We are now arrived at the stage at which so much care and watchfulness is required to insure the successful desiccation of the blocks. The blocks are generally turned out of the moulds, each on to a small platform, as it were, of suitable size, made up of batten widths (7in.) conncted with and screwed or nailed on to cross fillets of about 2½in. by 2in., to admit of raising the platform, and of an air-space between the bottom of the platform and the heated floor of the drying-shed. From this platform the block should not be moved until it has been in the drying-shed sufficiently long to admit of handling without damage. The hole in each panel end of the block is formed after it has left the mould, for the double purpose of the admission of air in the process of drying and firing, and to admit of handling while in the clay state. It will be seen that the faces of the blocks nearest the steam-pipes will receive a greater amount and degree of heat than those faces furthest from the pipes, leading to unequal drying and shrinkage, causing the blocks to warp and twist, and sometimes to develop cracks. For this reason the blocks should for the first few days be kept well removed from the steam-pipes, after which they may with safety be brought nearer; but the relative positions of the faces of the blocks to the steam-pipes should be changed from day to day to insure an equable process of drying. It is a great mistake to force or hurry the work in the drying. As soon as the block is sufficiently dry and firm to admit of dispensing with the platform, it should be removed. The platform arrangement is altogether a very unscientific mode, as the friction existing between the wood and the block interferes with the free contraction of the clay particles, exerted in an inward direction towards a common centre. The platform should be clean wrought on the upper surface, to minimise the friction, instead of being rough boards, as it more frequently is.

When the heated-air method of drying is adopted the floors of the drying shed are specially constructed for that purpose, which is not necessary when drying with exhaust steam with the pipes above the floor. All ground damp should be carefully excluded by draining with agricultural pipes the ground underlying the floor space, and the surface-earth outside the building made to slope or fall away from the exterior walls. Six inches of lime-concrete should cover the site overlying the agricultural pipes. Horizontal flues, about 9in. by 9in., or 9in. by 6in., are formed and carried under the entire length of the floor, the number varying with the area of the floor. In some instances these are grouped, running centrally through the shed, with a brick or half-brick division between each pair of flues. A system which recommends itself in preference to this, we think, is that of keeping the central portion of the floor solid for a barrow run, and for purposes of general traffic, reserving the sides for the flues, and for the stacking of the clay blocks.

The tops of the flues are covered over with 12in. by 12in. "quarries" (heavy paving tiles, and known by that name in the trade).

The disposition of the flues should be such as to get an equal distribution of heated air as far as practicable; but however carefully this may be attempted, there will always be what are known as "warm" and "cold" spots in the drying shed. The roof should be kept low, and of a flat pitch, to economise the heat, formed with open or naked timbers, and covered with untorched tiles on open battens.

There should be as few doors as possible communicating with the outer air, and these should be furnished with rising butts or other self-closing hinges, for the exclusion of cold draughts. The shed should be lighted preferably from the roof, with hinged skylights, opened and closed by means of lever gearing, each light being in its action quite independent of the others. More glazed surface than is necessary to light the shed has the effect of lowering the temperature during the winter season. The "quarries" covering the flues should be bedded in daub—3 parts road-drift and 1 part loamy clay—to prevent smoke discolouring the blocks while drying. The flues are supplied from furnaces kept constantly going at perhaps some remote part of the works, the various flues, or groups of flues, converging to the main chimney-shaft, with which all works are provided, and emptying into a common cross-chamber connected to the large chimney-shaft with a single inlet flue. In some cases the heated air from the cooling-kilns is made to pass through the flues of the drying-sheds, finding an exit through the main chimney-shaft of the works, instead of through the extract flues of the kilns as so much heated air wasted. In drying-sheds as just described, the clay blocks should be kept off the floors. A plan advocated by some persons is, when sufficiently firm, to place them on a layer of clay-dust intervening between the blocks and the floor, the dust being a non-conductor of heat, and affording the blocks a freedom of shrinkage not otherwise obtained, but which is recognised as being so essential to the production of true-shaped wares. Blocks that are crooked when placed in the kiln will not be straight when they are burned. The positions of the blocks must be varied from day to day to prevent one side or face drying faster than another, and so being drawn out of a straight line, for if one side be dried first, no matter how dry the block eventually become, it will remain crooked. For this reason the work should be dried slowly. The blocks should remain in the drying-shed until *white* dry—that is to say, until all mechanical moisture is expelled the clay. The blocks will then be found to be very little indeed larger than they will be required after burning, there being very little shrinkage in the firing of a thoroughly dried block. Blocks that are not perfectly dried when placed in the kiln whiten on their faces, and are often coated with a scum-like discolouration.

During the period of drying, the blocks become more or less surface-coated with fine dust and other foreign matter, which, having come into contact with the moist clay of the blocks, firmly adhere to their faces. To remove these, and bring forward the natural colour of the clay when fired, the exposed faces are rubbed with water and a brush just prior to going into kiln. When the brush is applied with too much vigour, the brush marks can be very distinctly seen on the terracotta after the process of firing, which is a decided defect in appearance.

(*To be continued.*)

NEW STABLING IN THE CITY.

AN excellent example of city stabling has lately been erected in Queen-street for Messrs. Pickford and Co., the carriers. The building is a spacious one, including a large van-yard about 80ft. square, a loading platform on the ground floor, and floors for luggage, &c., above. The ground floor of van-yard has a substantial floor, supported by three-ring brick arches between wrought-iron intermediate girders, carried by box girders resting on iron stanchions, concreted and laid with wood-block flooring; the floor over is of one-ring brick arches on wrought-iron joists, concreted and boarded. The main feature of the building is, however, the stable, in the basement, which is 56ft. long by about 25ft. wide. These are approached by a stone-pitched stepway for horses, forming a gentle incline. There is accommodation for 13 horses, the mangers are plain and massive. We notice that the whole paving is of Claridge's patent asphalte, and put down 2in. in thickness and grooved. The squares are about 5in. between the grooves, which latter carry away all the liquid, and form an admirable self-cleansing and draining surface, besides a good foothold for the horses. Running down the centre longitudinally is a wide centre gutter, slightly sunk, which will facilitate the removal of the urine and refuse. We have seen numerous forms of stable clinkers and vitrified paviors, with V and semicircular grooves, and several patented pavings; but the great objection to them is the difficulty of truly moulding them, laying them evenly, and grouting them. They frequently permit the washings and urine to soak into the foundations. Ordinary brick paviors wear unevenly and absorb the moisture, and the vitrified surfaces become slippery. From these objections Claridge's patent asphalte is free; the material itself is impervious and non-absorbent of the moisture, and can be laid to a uniform level and the V-joints made perfect. The surface is slightly gritty, and even, unlike that produced by warped bricks burned in a kiln, and the material has the further advantage of resisting the constant tread and pounding of heavy horses with iron-shod hoofs. The stable is well lighted by iron frames with pivoted lights in the centre. The building has been erected, under the immediate supervision of Mr. Stansby, by Messrs. Pink, Fryer, and Co., of Westminster, the foreman to the latter being Mr. Bowles, and the work is substantially executed.

"AN EXPLANATION OF THE LONDON WATER QUESTION."

THE adjourned discussion on a paper bearing the above title, and read before the Surveyors' Institution on February 15th, was resumed at the ordinary general meeting, held at 12, Great George-street, on Monday evening last, by Mr. C. K. Bedells, who said that he thought everyone would agree with the author in thinking that some modification of the present position and powers of the great water companies was urgently necessary. So great were those powers, and so arbitrary was the way in which they were exercised, that instances of positive hardship inflicted on the consumer were frequent. He referred more especially to the case of "Elgar v. Chelsea Waterworks Company," which had been brought before Mr. Curtis Bennett, at the West London Police Court, so lately as last week, and in which the facts were so flagrant as to elicit from the magistrate the following remarks, which he thought were well worthy of consideration by anyone attempting to deal seriously with this question of the London Water supply. Mr. Curtis Bennett on that occasion was reported to have said:—

> Legislation is imperatively needed to give the consumers some set off against the present powers of the water companies, who supply that which is absolutely essential for health and life, and without which people cannot live in the Metropolis. At present, although persons have duly paid all rates demanded from them—say in October up to Christmas—on Dec. 26, or on any subsequent date, before another payment the companies have power, without any notice, to cut off the whole of the supply to London. I believe that a short Act would in a great measure meet many of the difficulties, and I suggest the following: "That it shall not be lawful for any water company to cut off the supply at any time existing to any premises for non-payment of any water rate without at first leaving, either with the owner or occupier thereof, or affixing on some conspicuous part of such premises, a notice stating the amount due to them for any water rate, and giving fourteen days for the payment of such amount; and if any dispute should arise between the parties as to the amount due, either party within the said fourteen days may apply to any court of summary jurisdiction for a summons against the other party to hear and determine what amount is due; and should any water company cut off any water supply to any premises contrary to this provision, the company shall forfeit the penalty of £20, and the further penalty of £5 for every day during which such supply is so cut off. Provided always that if the Court shall be satisfied that the water has been cut off solely on account of any necessary repairs to the works, or mains, or pipes of the said company, then the company shall not incur any penalty for cutting off the water." But, in my judgment, the power of cutting off the water supply to any premises for non-payment of water rates should be absolutely taken away from the companies, for that which to life and health is essential should not be so dealt with. The remedy should be that if the water rate is unpaid fourteen days after having been demanded, the companies should have power to recover the amount due in a court of summary jurisdiction in the same way as poor rates are now recoverable. And within the fourteen days of the demand the person from whom the rate is demanded should have the power to dispute the same by a summons in a court of summary jurisdiction.

Mr. Bedells proceeded to quote from the article by Sir John Lubbock in the *Nineteenth Century* to prove his assertion, which was also confirmed by the report of the Duke of Richmond's Commission that the water supply of any large town should undoubtedly be in the hands of a central municipal body rather than in those of private companies, and he also showed, from the same sources, that there was, among experts, some considerable doubt whether the drawing of water from a chalk basin, as advocated by Mr. Grover in the paper, did not tend to decrease *pro tanto* the supply to the springs and streams of the district. He should not propose so much to buy up the undertakings as they stood, but rather to bring them all under one efficient municipal control, and he should certainly advocate that the London County Council should have the exclusive right to all sources of supply not now appropriated under the different companies' Acts of Parliament.

Dr. Evans (visitor) said the first question to be considered was, Is the present supply sufficient? and the second was, From whence can it be supplemented? Mr. Grover pointed out a source of supply as being available for the purpose; but on that question he differed from Mr. Grover *in toto cælo.* The question had been referred to a Royal Commission, and it was perhaps a little premature to suggest remedies until that body had reported. Mr. Grover put the rainfall over the Colne Valley at something like 260 million gallons per day, taking an average of about 26in. per annum; but as from various causes not more than 2in. or 3in. could be reckoned on as always available, the supply from that source could not be calculated at more than an average of 20 million gallons per day. Could this quantity be taken away from "the mouth of the bottle" without affecting the level in the bottle itself? He (Dr. Evans) lived in the "bottle," and so was considerably interested in the answer to this question. If there were an impervious stratum, through which it was utterly impossible for the water to pass, this might be possible, but he rather regarded the whole subterranean area of such a district as one great cistern from which water could not be drawn without affecting the surface level. If 20 million gallons were abstracted from the Colne at Rickmansworth by pumping from the chalk (as he believed would be the case), it was so much less to flow into the Thames above the intake of the water companies, so that the gain was only one of getting chalk water instead of river water. A gentleman near Rickmansworth had been for some time pumping water from a well and returning it to the river, and had found that the level of the river was not lowered! But, of course, this could prove little. In 1840 experiments were made under the direction of the Court of Chancery in connection with a case against a canal company, in which a well was sunk and springs in the neighbourhood were laid dry; the well was then puddled all round to a depth of some 70ft., but when pumping was resumed the springs were still affected as much as ever. The springs which supplied the streams represented, he believed, the overflow of the reservoir on which Mr. Grover proposed to draw, and if by pumping the level were reduced, this overflow must cease, and the springs be affected. There could be no more water in any district than fell from heaven, minus the loss by evaporation and vegetation.

Mr. A. G. Rickards (Associate) said that, having had the honour to be the leading counsel in favour of the Metropolitan Water Supply Bill promoted recently by the vestries, two points in Mr. Grover's arguments had struck him as worthy of notice. He was aware that his opinion, from a geological or engineering point of view, would be valueless; but it struck him that the author hardly made a sufficient allowance for the effect of continual pumping, thereby not quite sufficiently debiting himself on the side of the difficulties which must be encountered; while, on the other hand, he had failed to credit his account with the very considerable saving which could certainly be effected, as it had been and was constantly effected in some of the northern towns which controlled their own water supply, by constant pressure and by strict attention to fittings and connections. Instead of 32 gallons per head, or, as had been said by a witness before Sir Matthew White Ridley's Committee, 20 gallons per head, now supplied to London, it had been found practicable, by attention to such details as he had alluded to, to reduce the consumption to 12 or 15 gallons. The Duke of Richmond's Commission, appointed in 1866, and which reported in 1869, dealt with the purely scientific aspect of the question, and found that the quality of the London supply was good, and that the Thames and Lea, supplemented by the deep wells, would give a sufficient supply for the near future. Dr. Frankland said that since that date the quality of the supply has been greatly improved; but the growth of London had been so much greater than was contemplated by the Duke of Richmond's Commission that the question of quantity had now again to be seriously considered. The quality of the suggested supply from Leatherhead and Rickmansworth was undoubted, but whether the quantity would be sufficient, or whether injury would be done to local interests by obtaining it, was for experts, more learned in the matter than he, to decide. Sir William Harcourt's Commission had dealt mainly with the cost of acquiring, and the method of compensation for, the various companies' undertakings, and Sir M. White Ridley's Commission had proceeded on the postulate that the present companies must make way for one central municipal control. The former Commission declined altogether to hear evidence as to a competing supply, holding that, in face of the immense amount already expended on the distributing mains of the existing companies, it would be little short of ruinous to attempt to do all the work over again. The cause of the rejection by Parliament of Mr. Edmund James Smith's scheme was, he thought, because that gentleman had allowed too much for unearned increment, and too little for the expense of new and additional sources of supply. The compensation to be paid would, he believed, be best determined by arbitration, not under the Lands Clauses Acts, but by a board of arbitrators, consisting of one person nominated by the Local Government Board, one by the Surveyors' Institution, one by the Civil Engineers, and one by the Bankers' Institute, before which the principles to be applied and the methods of assessment to be adopted could be threshed out and brought into such a form as would be applicable to every one of the eight great companies. The basis of calculation of value would probably be the market value of the shares, regard being taken to the quality and quantity of the supply, and the amount of capital which must be expended in the immediate future to put that supply on a satisfactory and sufficient basis to meet all demands as they arose. Then it was necessary, he thought, that the municipal authority should acquire the undertakings within a reasonable time, in order to save the ratepayers having to pay for the enormous growth of the value of the companies. Since 1871 the market value of the stock of the eight great companies had increased from £14,500,000 to £33,500,000, while the additional capital raised during the same time had only been £4,500,000. So that every year's delay meant an enormous increase of cost to the ratepayers, which should by all possible means be avoided.

Mr. T. W. Wheeler, Q.C., said he thought one of the most important points to be considered was—taking it for granted that some change in the present system was necessary—into whose hands should the control of the water supply of London be committed? London had become so vast that it had long ceased to be a mere town, or even a capital city, but was, in population and wealth, almost a nation in itself, and almost too great for the whole control to be placed in the hands of one body. Nature had seemed to indicate that there should be two cities, one on the north bank of the Thames, and one on the south. Then the multiplication of trusts and representative bodies was a thing scarcely to be contemplated with equanimity, and if it went on at the rate threatened, would at length reduce London management to one colossal bumbledom. Previous speakers had, he thought, rather exaggerated the power of the companies, representing them as being almost beyond the reach of the law; but he instanced a case in which, proper legal advice having been taken, a company had been promptly brought to its senses, and heavy fines inflicted for a breach of their Act. In the recent case before Mr. Curtis Bennett, the decision had turned on the purely technical point whether legal tender had been made, and had nothing to do especially with the powers of the companies.

Mr. H. Wilkins, vestry clerk of St. James's, said that from the very small number of cases of the kind referred to which came before the public, it would seem that the companies exercised their undoubtedly great powers with a good deal of moderation. In handing over the water supply to any new central authority it must not be forgotten that, while the population of the London county was some four and a half millions, there were still some one and a quarter millions in the outer ring supplied by the water companies, and that while the area under the control of the London County Council was about 125 square miles, the statutory powers of the companies extended over about 500 square miles, and the outer ring was increasing in proportion much more rapidly that the inner. Would it then meet the views of a resident in the outer ring to place his water supply under the control of a body in whose election he had no voice, or would it be fair to purchase the present companies' undertakings and raise the money by a loan, to be repaid in 60 or 90 years, by which time the existing proportions of population would be changed if not reversed? Every committee had recommended that the governing authority should be "representative of the consumers." Would the London County Council meet this requirement? The low death-rate of London showed, he thought, that there was not much ground of complaint as to the quality of the supply.

Mr. E. K. Burstal said that the argument that anyone might dig a well to supply his own needs if he chose had a curious light thrown upon it by the recent attempt of the London corporation to supply some artisans' dwellings by this means. After paying working expenses and interest on capital expended, &c., the cost per annum was rather more than three times the annual charge made by the water company.

Mr. E. H. Stevenson said that he thought, before seeking a fresh supply to meet the demands of London, it would be well to try if some economy could not be effected in the supply already available. In the large provincial towns the authorities who controlled the water supply were not content to leave it, so to speak, at the consumers' doors, but made a careful inspection from time to time of all internal fittings, with the result that the consumption had been reduced, by reduction of waste alone, to 12 or 15 gallons per head, as against the 25 or 30 used in London. At this rate the present available sources would be amply sufficient for a population of 7½ millions, which need scarcely yet be provided for.

Mr. W. Whitaker, speaking as a geologist, said that anyone who would examine a geological map of the districts from which it was proposed to draw the additional supply, would see that the great chalk beds were overlaid in places by impervious patches of various kinds, which considerably reduced the area over which the rainfall was available as a source of supply through the chalk. In considering this question, few persons thought how much water was taken from the chalk by private wells in the London district. The quantity was probably not less than ten million gallons per day.

Mr. J. Lidiard agreed with previous speakers that if any change in the present system were to be effected, it was of great importance that it should not be delayed, as every year's delay must necessarily increase the price without raising the actual value of the undertaking.

Mr. Grover, having briefly summed up the discussion, and explained, by means of diagrams, his theories of the possibility of a sufficient supply from the chalk, and his practical experience in obtaining such a supply in the Rickmansworth district, the meeting adjourned.

HISTORIC HOUSE ARCHITECTURE.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

M. CHARLES GARNIER, the distinguished architect of the new Opéra, and Prof. A. Ammann have just published a great work entitled "L'Habitation Humaine,"* illustrated by nearly four hundred drawings, which represent typical examples of the dwellings of man from prehistoric times to the modern days in all parts of the world. The programme indicated in these few words immediately strikes one by its comprehensive character, which is replete with interest to all who care to know how our ancestors lived in past ages, and ascertain, with some degree of accuracy, how, in various countries, man has made his home and contrived his dwellings under the varied circumstances of time and place. It will be evident, therefore, that we are scarcely able to do more than briefly indicate for our readers in this place a general idea of the nature of the book to which it is desired we should draw attention. By the courtesy of Messrs. Hachette, we are enabled to print herewith a selection which we have made from the plates and woodcuts in the volume before us. These will serve to show in what style the illustrations have been rendered, and also the type of subject chosen by the authors. Their review carries us back to the ages of primitive barbarianism, when men found their shelter in rocks and trees, huts, lake dwellings, and hovels of various shapes and materials. Their weapons of flint and rudely-cut wood are familiar, like much that is generally known of their habits and customs; but the pages of Messrs. Garnier and Ammann, by the aid of learned maps, curious plans, and graphic details, supplement mere sciolism, and add erudite information to previous knowledge. The Historic period, of course, most interests the general reader, and M. Garnier's specimen houses, erected in connection with the Paris Exposition of 1889, go a long way to practically illustrate the subject. Turning now to the examples represented on our lithographic double-page, it will be seen how eminently diverse they are. The famous, or rather familiar, Council-house at Shrewsbury in half-timber ranks as a thoroughly representative specimen of the Salopian style. The kindred character of a homely kind in brick is seen at Amsterdam in the street view herewith chosen, while in the Hôtel d'Ecoville at Caen we are furnished with a very beautiful and refined example of the best period of the French Renaissance, similar to the well-known Hôtel du Bourgthéroulde at Rouen, which has perhaps a more Gothic mannerism about its details. The Château d'Azai-le-Rideau, which likewise figures on our sheet, is of the same famous period in Normandy, which is represented by such houses as the Manoir d'Ango, near Dieppe, and the châteaux of Chenonceaux, de Nantouillet, and the house of François I. at Moret, to say nothing of the very numerous existing dwellings of that date in France. The Anamite house from Monkay, Tonquin, has much of the characteristic quaintness of Chinese building more massively carried out, and the dwelling itself follows the same lines. More crude still is the Negro house of the King of Sego at Yamina in Africa—a solid and almost Egyptian type of building, with big buttresses carried out and cut short in a singular fashion peculiar to the white mud houses of the Soudan.

◆

HANDBOOK OF GREEK ARCHÆOLOGY*.

A HANDBOOK of Greek archæology for English readers and students was much wanted, and Mr. A. S. Murray, LL.D., F.S.A., Keeper of Greek and Roman Antiquities in the British Museum, has brought out a volume of reasonable size which will to some extent meet the wants of a large class of students. To his Rhind Lectures in Edinburgh for 1887 he ascribes the origin of the book. The author has endeavoured to group together facts and to deduce general truths rather than to multiply details, and his work will on this account become a useful guide to the materials and collections to be found in the British Museum. In the first chapters the primitive period of the artistic products of Greece is treated, especially the early stages of pottery, gem engraving, glass, bronze, and the precious metals, and these objects are illustrated by a large number of vases of the primitive and Mycenæ types, of the Geometric type, gems in the British Museum, in most of which sculpturesque animal and human forms predominate. Then follows the archaic period, in which the imagination of the artist takes the place of mere handicraft, illustrated by many fine examples of pottery. The remarks on vase painting are of value in drawing attention to an important branch of pottery decoration. The black and red figure vases are illustrated by some very beautiful examples in amphora—Plates VI., VII., VIII., X. Many typical changes of costume are found on the vases. An Assyrian design can be traced in many early vases, which have bands of Oriental animals. Mr. Murray says the principal sources of these Greco-Asiatic vases are Rhodes and Naucratis in Egypt; this ornamentation was invented in those places, and adapted, with modifications, by the Greeks. This Orientalising influence is seen also in the painted animals placed in a row on vases or in geometrc bands. Then the human figure was introduced, as in the fine vase or œnochoë, illustrated p. 80, which has a band or frieze of armed men, with a second lower band of animals, with rosettes on the vacant spaces. The figures are black on a drab ground. Incised designs in bronze are described in chapter IV.; they belong to a period not earlier than 400 B.C., and chiefly to Corinth, where bronze work was manufactured. Etruria also yielded incised bronze mirrors and cistæ. A beautiful bronze cista is in the British Museum, and is engraved on p. 136. Figures of Aphrodite and Pan, Perseus cutting off the head of Medusa, and other myths, are engraved in these bronzes. Engraved gems, scarabs, cameos are illustrated by photogravures of intaglio gems, a fine sardonyx cameo of the daughter of Augustus in the same Museum. Next, the subject of sculpture in relief is taken up, as being allied to gem-engraving and vase-painting, and, of course, the character of Assyrian and Egyptian art is stamped in the relief sculpture of the early Greeks. The bas-relief was the form generally found; the outline was everything, to which the details were subordinated, and this character is to be found in Greek sculptural relief. This chapter is illustrated by the elevation of the Doric Temple at Assos in the Troad, as restored according to Mr. Thatcher Clarke. The frieze and metopes are immediately above one another, and the relief is low. Some fine examples of the Pedimental sculpture—Acropolis of Athens, executed in stone (poros), the figures brightly painted—are shown, the background being the stone. A plate illustrates the sculptural relief of west pediment Olympia; another a slab of the Parthenon frieze. Statuary forms the next subject, and this is illustrated by several well-known examples, as Theseus, the Hermes of Praxiteles, statue of Demeter, groups from the Parthenon pediments reproduced by photography, and several wood engravings. Terracottas, painting, and architecture are also separately treated, the latter rather inadequately. The illustrations we have seen in Fergusson's "Handbook." A few plans of the types of temples, and an explanation of such details as intercolumniation and other arrangements of columns and domestic buildings, would have been useful. The hypæthral roofs are barely touched. The Handbook, as affording a general and popularly-written exposition of Greek archæology and references for further study, should be in the hands of all students.

◆

CHIPS.

The employés of Mr. J. Andrews, builder, of Thornford, partook of supper to the number of fifty on Wednesday week, at the Mermaid hotel, Yeovil, under the presidency of Mr. Andrews, the occasion being the coming of age of the employer's son, Mr. Wilfred Andrews.

A new side altar was unveiled at St. Alexander's Roman Catholic Church, Bootle, last week. The altar is of Caen stone and marble. The altar table is supported on two columns, having a carved panel underneath representing St. Francis in the act of blessing the town of Assissi. The reredos is divided into two panels, with a niche containing a statue of the Sacred Heart in the centre. The work has been carried out by Mr. J. Geraghty, of Bootle, and the architects were Messrs. Sinnott, Sinnott, and Powell, of Liverpool.

At Tuesday's meeting of the London County Council it was resolved:—"That the Council refuses to consider a lower payment than 6d. an hour as a fair rate of wages to be paid to labourers by the contractors for the works of the Blackwall Tunnel, and as complying with the declaration made in their tender that they pay the rate of wages generally accepted as fair in the trade."

A provision-shop at the corner of Market-street and Factory-road, Eastleigh, collapsed on Thursday in last week. The building was being altered by Messrs. Wright and Sons, and just as the workmen had left an iron pillar fell outwards, bringing down the bressummer and the brickwork above. No one was seriously injured.

The will of Mr. William Henry Punchard, of the firm of Messrs. Punchard, M'Taggart, Lowther, and Co., of 151, Cannon-street, engineers and contractors for public works, who died on Dec. 25th last, at Norbiton, Surrey, has been proved, the value of the personal estate amounting to £19,000.

The Willesden local board have decided to provide three public libraries in the district, one at Willesden-green, another in Harrow-road, and a third to be combined with fire-engine station and coroner's court in Kilburn. For the first-named institution six architects have been invided to submit designs in competition.

The will and three codicils of Mr. Henry John Castle, C.E., late of 40, Chancery-lane, who died on November 27 last at Brighton, has been proved, the value of the personal estate amounting to upwards of £20,000. The testator bequeaths his share of the goodwill and fixtures of his business, and the copyright of his book, "Castle on Rating," with the copies, to his son William Henry Baldwin; the copyright of his books "Castle's Engineering Field Notes," and "Castle's Textbook," with the copies, to his son Edward James, Q.C.

Our Illustrations.

MOSAIC BY DR. SALVIATI.

A SHORT time ago we drew attention to a mosaic panel recently fixed in the Church of Annunciation at West Chislehurst. We have since viewed the work more particularly, and now give briefly a fuller description of it. Our illustration, although, of course, it does not give anything like the beautiful detail in expression, and consequently the grand effect of the blending of colour, which is such a feature in the work itself, will convey a fair idea of the artistic treatment which this mosaic has received at the hands of Dr. Salviati, of Venice, and Regent-street, London, to whom it was intrusted. The original cartoons for the work were painted by Mr. N. H. J. Westlake. The mosaic is in the spandrel over the chancel arch. It covers a surface of about 380sq.ft. The subject is the Adoration of Christ by the Saints: Christ, the central figure, is seated on a throne, surrounded by angels; on either side are grouped the Twelve Apostles, while in front of the central figure is that of St. Michael the archangel. The figures of the Virgin Mary and St. Joseph also appear, arranged on either side of the Christ a little in the foreground. The background of the mosaic is of gold, which throws up the figures and adds greatly to the effect, which effect can only be produced in mosaic.

HISTORIC HOUSE ARCHITECTURE.

(FOR description, see p. 334.)

LEEDS—NEW POST-OFFICE.

THE construction of this building is now being commenced on a site near the Midland Station and the present Post-office. It will, towards the streets, be faced with Haworth stone. The doorways will have steep granite architraves, and the columns will be of grey Aberdeen. Generally, the building will be of three stories and a basement, but for the present the stories above the ground floor towards Quebec-street will not be erected. This will be done when demand arises for increased space. The front building will be surmounted by a large flêche covered with lead, containing a ventilator and a clock. The centre of the front building ground floor is occupied by the public office, and on the left will be the sorting-office, and on the right the postmaster's offices, with those of the engineer in the mezzanine over. The parcel office is situated towards the rear in Infirmary-street. On the first floor there will be accommodation for the staff, returned letter office, &c., and on the second floor will be the instrument-room, battery-room, and refreshment department. The basement will be used for engineers' stores, telegraph delivery, and boys' rooms, men's kitchens, engine and boiler rooms, and other similar purposes. Offices for the Inland Revenue Department will be provided at the west end of the Infirmary-street buildings. The lighting throughout will be by electricity, and, generally, the building will be of fireproof construction. Mr. Henry Tanner, F.R.I.B.A., of H.M. Office of Works, is the architect. We shall give some details of the building shortly.

ST. SILIN CHURCH, LLANSILIN.

A GOOD illustration of the historical value of church restoration has been afforded in the work carried out at Llansilin Church, during which a number of interesting discoveries were made. The removal of the plaster ceiling in the chancel revealed a very fine late 15th-century panelled roof. Behind the modern west gallery was found the original Jacobean gallery, with a letter, dated August 6th, 1645, from Sir John Watts, commander of the Royalist troops, to Mr. Jarvis, the minister of Llansilin. Beneath the floor were fragments of the rood loft, the 15th-century seats, and a portion of the stone altar. As the church now stands, with its dedication to the British Saint Silin, and his holy well in an adjoining field, the nave arcade pillars similar to those at Valle Crucis Abbey, which was founded in 1199 by Prince Madoc, whose first cousin lived in the parish; and also the evidences of the renovations following the destruction wrought during the rebellion of Owen Glendowr, the Reformation, and the Civil War—a continuous record of all the leading events in the history of the church from the 6th to the present century is preserved. If the recommendations of that very misnamed body the Society for the Preservation of Ancient Buildings had been adopted, it would have remained in its veiled condition, and allowed to continue a sufferer from present decay and to risk the chance of future destruction. The work of restoration has been carried out by Mr. Bernard Clarke, of Birmingham, from the designs of Mr. Arthur Baker, F.R.I.B.A., of Kensington.

MUNSTEAD CORNER, GODALMING.

THIS house, now approaching completion, at Munstead, about one mile from Godalming, is built of Bargate stone, with a red, local-tiled roof. The first floor is half-timbered. There are nine bedrooms, bath-room, &c. Messrs. Mitchell Bros., of Shalford, are the contractors, and Mr. Edwin L. Lutyens the architect.

CITY OF COVENTRY PUBLIC BATHS COMPETITION—SECOND PREMIATED DESIGN.

(A DESCRIPTION of this design will be found on page 355.)

FONTS AND COVERS AT KIPPAX AND FEWSTON CHURCHES.

"CHEPESCH" of Domesday, or Kippax, is of more particular interest to the antiquary than the architect. W. Wheater has it on record that "in the Anglo-Norse days the whole of Kippax extended from the Roman Rig (Castleford to Tadcaster), including Osmandthorpe, but finished at the modern township of Leeds." The village stands on a bold and elevated site, and the church tower is a marked feature in the landscape, and forms a prominent land-mark for miles around. The church, although very much "wasted" by successive restorations, has still many indications of its antiquity, and to those initiated in the signs, they will not be slow to detect the herring-bone walling in the tower, "bits" of Norman enrichment, walled-up slit lights, &c. Architecturally the subject of my drawing is the most interesting item. The design of the upper portion is worthy of remark, in its having a strong resemblance to a crown. May this be taken as an indication of an attempt on the part of the workmen to work in the idea of Church and State? The subject of my second drawing, although not so unique, is, from its quaint simplicity, of marked interest. The church was burnt down in 1696, and rebuilt in 1697, which date is over the south porch. An interesting record, made at Pontefract Sessions, 1696, gives:—"The vallue of the losse of Fewston Church, viewed and vallued by substantiall workmen, whose names are hereunder written:—Imp., the vallue of the stoneworke, plastering, leading, and glasse, £355; for the roofe, £249 18s.; sleepers, boards, and seats in ye church, £110; ye pulpit, reading-box, and bannisters betwixt ye church and quire of four doores, £9 0s. 9d.; the whole losse is £723 18s. 9d. Thos. T. Paper and Mayer Shutt, masons; Thos. Chippendale and Constantine Gill, carpenters. The justices sent an address to the Lord Keeper of the Great Seale respecting the great and sudden fire at Fewston Church, through the negligence of the Plummer who was repairing the leads." Fewston is the "Foston" in Domesday, and the church was one of the three original churches of the Forest of Knaresborough. Edward Fairfax, the poet, and a member of the great Yorkshire family of that name, was born at Newhall, near Fewston. His translation of Tasso was first published in 1600. He died in 1632, and was buried at Fewston Church. The church is beautifully situated on rising ground, and overlooks the extensive reservoirs of the Leeds Waterworks system.—F. MITCHELL. [P.S.—Kindly allow me this opportunity of correcting an error of date which has crept into the drawing. The date of the Fewston registers is 1504, and not as given on the drawing. It is one of the pre-1536 registers, of which there are several in Yorkshire, and about forty in all.—F. M.]

MODERN ENGLISH FIREPLACES.

ONE of the chimneypieces shown in this sheet comes from the establishment of Messrs. George Jackson and Son, of Rathbone-place, and is made in the fibrous plaster for which this firm is justly celebrated, and of which we have before given good examples. No material lends itself more readily to really good and effective work at moderate cost, and by no makers is the architect surer of having his designs ably and faithfully interpreted. The other chimneypiece is in the banking room of the Lancashire and Yorkshire Bank at Manchester, of which Messrs. Heathcote and Rawle are the architects. It is executed in Blanc Clair marble, and in the frieze the arms of Lancashire and Yorkshire are introduced. The hearth kerb is of Rouge Jaspé marble. The walls of the chamber are faced also with marble —Rouge Jaspé in broad bands alternating with narrow courses of Pavonazzo—the frieze over being formed of the same marbles in panel and pilaster work. The work has been executed by Messrs. J. and H. Patteson, of Manchester.

CHIPS.

The Toxteth board of guardians have finally adopted revised plans for a new workhouse hospital, prepared by Messrs. C. O. Ellison and Son, of Liverpool, and estimated to cost £32,700 in execution.

The Camberwell board of guardians have accepted the tender of Messrs. Higgs, of Loughborough Junction, at £61,000, for the erection of a new workhouse on Champion-hill.

The owners of upwards of twenty houses were summoned to the Woolwich Police-court recently to show cause why orders should not be made to close them, the buildings having been condemned by the medical officer of health. The magistrate decided to view some of the property; three summonses were withdrawn, and the others were adjourned for the owners to repair their premises. Two hundred and twenty houses in the district have been condemned by the medical officer of health.

A new police-station has been erected at Headingley, Leeds, and special attention has been paid to the ventilation, which is carried out on the Boyle system.

The North Bierley Joint Hospital, Low Moor, which is being erected from the design of Mr. W. Longley, architect, Bradford, is ventilated throughout by means of Shorland's patent exhaust roof ventilators and fresh-air inlet tubes, the same being supplied by Mr. E. H. Shorland, of Manchester.

Mr. James Mansergh, C.E., the engineer to the water scheme of the Birmingham Corporation, has prepared his Parliamentary estimate of the expense of this undertaking, which, including all works and contingencies, he sets down at £5,851,000. The cost of constructing the $3\frac{3}{4}$ miles of railways in Wales is put down at £26,950.

Negotiations for a site for a new Post-office for Weston-super-Mare have just been concluded, the Government having agreed to purchase of Mr. H. A. Forse, builder, of Bristol, who is building the new Arcade, Verandah House, situate in High-street. The new office will cost about £6,000, exclusive of the site, and the work will commence as soon as possible. The new office will be approached by a road from High-street 40ft. in width.

WAYSIDE NOTES.

In the forthcoming election of County Councillors for the "County of London," I should like to see a return of such gentlemen as are likely to proceed with more or less of the schemes for Metropolitan improvement that have long been on the stocks. Contemplated alterations to existing and inconvenient portions of the City have been so persistently shelved to make time for the discussion of the purchase of tramways and other projects, that a little novelty would be a wholesome change. To neglect proper municipal business is absurd, whether caused by the ardour of "Progressives," or the obstinacy of "Moderates."

People complain of the way things tend nowadays, and the development of what they are pleased to call "ultra-radical principles." Much is their own fault. The inertness—to use a mild and inoffensive term—of the upper and middle classes is responsible for very many effects and results in electoral matters. If electors will be too lazy to go to the poll in Parliamentary and municipal elections, they may sit and grumble to their hearts' content; but, in common fairness, they should not expect things more to their taste whilst neglecting to throw in their own votes. Many will say that the London County Council should do this and that—make improvements in existing thoroughfares, keep to questions of a purely municipal character, and leave tramways and other outside matters alone—and all the time will take care to absent themselves from the polling stations to-morrow. Let anyone, then, with an honest desire for a really honest and efficient County Council, bestir himself to-morrow, and not stay at home like a coward.

The Council has at any rate had excellent chairmen, and its accomplished works, or undertakings promoted and commenced, should be accredited to it. Sir John Lubbock, in the course of a reply to a vote of thanks offered by the Council to their chairman on Tuesday, summarises the tangible works done by the Council as the completion of Rosebery-avenue, the commencement of the Blackwall Tunnel, and the completion of the Northern Main Drainage Works at Barking. Further, in a few weeks the works at Crossness will be ready for opening, and when in action will do much to purify the Thames. The Council has also done much towards enlarging and beautifying the parks. The sum total of works accomplished is modest enough, and it is to be noticed that all are merely the carrying-on of schemes projected by the "late lamented" M.B.W., the Council not having had the boldness required to launch on new undertakings of any magnitude.

There are various ways of spending a bank holiday. Mr. Dixon-Hartland, asking in Parliament, on Tuesday, for a Royal Commission on the doings of the London School Board, is reported to have said that when the question of sites was raised in the Board, it transpired that an architect's clerk had spent the whole of a bank holiday destroying papers which might be detrimental to certain parties. It is to be hoped that this poor unfortunate individual received extra pay for his extraordinary service, or at least that it happened to be a "Wet Monday," and he had no longings to be a-boating or fishing.

Mr. Dixon-Hartland puts down the amounts paid to architects and others connected with the department up to a certain date—ten years, and presumably to the end of the Great Bad Building Dynasty—as £117,855. This seems a lot, but would probably be found to be but a fraction of what should have been received by the architectural fraternity if the buildings had been sufficiently "architected" at 5 per cent.—if, that is to say, the work had been put out to general competition. I do not fancy that any complaint can fairly be made nowadays about money expended on the architectural department, which is efficiently managed and well ordered. What may have been the case on other occasions I am not in a position to say. Anyhow, Mr. Dixon-Hartland's very trenchant speech is calculated to make those concerned "sit up." We shall probably hear more of the matter.

It seems probable that a joint committee of Lord and Commons will be appointed to consider the best method of dealing with the new light electric and other railway schemes for London. One of the proposed subjects of inquiry is whether such railways are calculated to afford sufficient accommodation for the present and probable future traffic. This is certainly a point needing early attention. I have occasionally to go in a direction that renders the City and South London Railway Company's line very convenient. The awful crush to get seated in the train at King William-street about 6—7 o'clock has always impressed me. We all know that an English crowd has a selfish impetuosity that no reasoning in the world will hold in check. It does not want a theatre fire to show up this spirit vividly. Watch the attempt of about two hundred men to get into these trains as quickly as twenty. There is a frightful "congestion"; women and children have to look after themselves—it is all the same to those struggling in. It is no exaggeration to say that the would-be occupiers of the cars behave more like beasts than human beings. And yet here is a thoroughly democratic railway—only one class, sweep and city prince must go together. Watching this nightly scene, one can understand why true socialism fails, why Owen and others have laboured in vain, and why it is folly to dream of social revolutions when the competitive system is ingrained in the flesh, and man is ruled rather by nature than grace. Any inclined to waste their time on these questions might save themselves all their trouble by early taking an object-lesson at the King William-street terminus of the C. and S.L. Railway.

All of which has reference to Mr. Whitmore's proposed "Joint Committee of Lords and Commons." The trains of this pioneer electric railway are undersized, and are the reverse of being too long and too loose. One enters at the ends, on the Pullman or tramcar principle. Here, then, is a matter for the consideration of the proposed committee. Is the arrangement the best that can be devised? Here, too, is a matter which a true municipal councillor would find a more profitable subject for discussion than tramway confiscation. In one way the arrangement is excellent, an electrical railway being a dangerous place of promenade, the conductors have their passengers well under their control. They cannot leave the cars except when the end doors are opened; but whether this advantage outweighs all obections is a point for inquiry.

A good number of ***A.A. Notes*** to hand for March. Mr. T. F. Bumpus has some useful notes on "The Cathedrals and Churches of Northern France," that will be read with interest by students contemplating a tour that way this summer. Mr. Owen Fleming continues his suggestions on "Some Artistic and Hygienic Problems in London," and Mr. F. M. Simpson writes of "A Thirteenth-Century Town"—Figeac in the South of France, which the writer's guide-book averred to possess "deux cents maisons environ du XIII.^{e} siècle." Mr. Simpson cannot now affirm that these two hundred houses exist, but he says that he had "never before grasped so thoroughly what a town was probably like in the 13th century." In the "Notes" we read that a decided improvement in the attendance at the ordinary meetings has been observable during the past month, so I shall take to myself the honour of having helped this desirable end to, say, the extent of one per cent. of the increased attendance, which is so modest a claim that I am sure no one will grudge it. I read that the poor fellow who recently met with such a terrible death at Kensington Court-place, was a member of the Association, and last year admitted to the Lower School of the Royal Academy. He was generally liked, and showed considerable promise for the future.

The general committee of the Association received a petition asking that smoking should be permitted in the studios during working hours. There could, of course, be only one answer to such a request, and I, though a "blower" of "'bacca" in a moderate way, am glad to see that the committee—albeit composed mainly of smokers—have decided to uphold the prohibition. There is a time and place for all things. (P.S.—I note there is a pipe by my desk, and it is scarcely cold!)

Goth.

* * *

BUILDING TRADES' EVIDENCE BEFORE THE LABOUR COMMISSION.

The Royal Commission on Labour received, on Friday, evidence from representatives of the building trades. Mr. J. Beveridge, of Glasgow, secretary of the Associated Carpenters and Joiners of Scotland, claimed on behalf of the workers the right to refuse to work with non-unionists. He admitted employers had an equal right with workmen to keep a black list. Mr. F. Chandler, of Manchester, secretary of the Amalgamated Society of Carpenters and Joiners, and Mr. G. J. Davies, formerly chairman of the same society, were called together. They said that the society was one of the strongest in the country, its membership being 30,693, and its assets £66,359. The average hours were 51½ in the summer, and 47 in the winter, and the average wage 8d. an hour. The men had greatly improved their condition of late years, and the employers recognised the society when it was strong. Mr. Davies urged that some alteration should be made in the Employers' Liability Act, in order that employers should not be able to get rid of their legal responsibility. Contractors were too often men of straw, and not able to pay an award when obtained. The short period of notice during which claims for compensation could be made should be extended, and there were too many qualified conditions, which rendered the Act inoperative. The only just mode of settling the question was to place it under the common law, and to say there should be no compensation except such as was awarded by a jury. Mr. W. Knox, of Liverpool, secretary of the National Association of Master Builders, stated that the association included every branch of the building trade, and embraced all the large contractors of the country. The hours of labour had decreased during the last 20 years, and wages were much higher than they were 30 years ago. Sub-contracting worked very well. There were no stoppages or deductions of any kind. Everything was payment by the hour and notice by the hour. There was a good feeling between masters and men. The men were never asked whether they belonged to the union, and the masters discouraged black-listing. Witness denied that insurance made the employer careless. Mr. P. Lynskey, representing the Amalgamated Carpenters and Joiners of Dublin, said they numbered 1,100 in Dublin, and were affiliated t the English Association. The general wages wer 34s., equal to the average in England. A present the understanding between employer and employed was good. There was a strike i June, 1890, which resulted in a reduction o hours from 60¾ to 54. It lasted four weeks, an was settled by mutual conference. Unionist were, he thought, right in refusing to work wit non-unionists. Mr. R. S. McNamara, chairma of the United Building Trades of Cork; Mr Otley, general secretary of the Plasterers' Asso ciation, numbering 5,600 members; and Mr Dew, secretary of the London United Buildin Trades' Committee, were also examined.

* * *

At the half-yearly meeting of the West Metropo litan Tramways Company held on Monday, it wa announced that a tender had been accepted £13,000 cash, for the reconstruction of the main li from Hammersmith to Kew by a double line.

It has been decided to restore the parish church Ewell, Surrey, and to lengthen the structure by a extension of the chancel eastwards. Over £3,5 has been promised towards the scheme, the plans f which were prepared by Mr. Thomas.

The English Benedictine Monastery at Ampl forth, near Helmsley, is about to be rebuilt on more extensive scale, and a monastic church a preparatory school are among the fresh feature Mr. C. Walker, of Grey-street, Newcastle-on-Tyn is the architect.

An inquiry was held on Wednesday week General Carey, an inspector from the Loc Government Board, at Thornhill, touching application by the sanitary authority for sanction borrow £26,346, to defray the cost of carrying o sewerage works and works for sewage dispos The witnesses examined were Mr. J. H. Dyso clerk to the board, and Mr. Haller, C.E., t board's surveyor.

CITY OF COVENTRY PUBLIC BATHS COMPETITION.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

SECOND PREMIATED DESIGN.

THIS design, submitted by Messrs. Giles, Gough, and Trollope, under the motto "Experience," was placed second by Professor T. Roger Smith in a recent competition. The first place was given by the assessor to Mr. Burgess, of Queen-street, Cheapside, who, acting in conjunction with Messrs. Spalding and Cross, is now carrying out the work. There are ten first-class men's baths, ten second-class men's baths, and on the first floor, over the first-class men's baths, are placed the ladies' baths, and over the ten second-class men's baths the remaining ten required. To the rear of this block are placed side by side, lengthways, the two first-class baths, and beyond these the second-class bath, and at the extreme end the boiler, washhouse, drying-horses, &c., with yards, with entrances for coal and materials. For the sake of convenient description we call the swimming-baths first class, second class, and third class. The first-class swimming-bath is 90ft. long by 35ft. wide in the clear, and 104ft. by 50ft. in clear of walls. The depth of water is 3ft. 6in. at one end, and 7ft. at the other, when the bath is full. There is an ample supply of dressing-boxes, and a gallery running over them on all sides of the bath for spectators, with two distinct stone staircases entering from the corridor, and one from the bath itself. The roof of this bath is of pitch pine, of special design and strength, for attaching apparatus so that it can be converted into a gymnasium in winter. The second-class swimming-bath is 90ft. long by 35ft. wide, and 104ft. by 50ft. in clear of walls. This bath has a sufficient number of dressing-boxes provided of the size required. The depth of water is the same as the first class. The third-class bath is also 90ft. long by 35ft. broad and 102ft. by 48ft. in clear of walls. The depth of water is the same as the others. There is a "soap hole" or plunge bath, 10ft. by 8ft. 6in., and a shower-bath is suggested in the corner of this bath if desirable. To all these baths the necessary urinals and w.c.'s are provided. The ends of baths are rectangular with rounded corners, and all steps, &c., are recessed into the walls, and there is no fixed obstruction below water in either case. The first-class men's private baths are provided on the left-hand side of centre of building; they are each 7ft. by 6ft. 6in., with a waiting-room, attendant's room, w.c., &c., in connection. On the first floor over these are placed the ten ladies' baths, four of which are first class and six second class, also with separate waiting-rooms, w.c.'s, &c. The ladies' baths are approached from Priory-street by a separate and distinct entrance, with ticket-office attached. In the exact centre of the front block in Priory-street is placed the superintendent's office, with ticket-office adjoining. On the left of this centre is the entrance for first-class men's baths, and on the right the entrance for second and third class men's baths. The ticket-office is so arranged that all men's tickets are supplied from it; but the two entrances are perfectly separate and distinct, and the second and third-class baths are entirely shut off from the first class. On the extreme left of the front block is placed the ladies' entrance to their private baths on the first floor. This entrance is also arranged to communicate with the first-class swimming-bath by means of a corridor at the back, so that this bath can be available for the use of ladies when desired, and yet be completely and entirely shut off from men on those days. On the extreme right of this front block is placed an entrance or exit for the third-class swimming-bath when required. It is thought that this exit would be very useful in case of a crush, and might be arranged with a turnstile, so that it could be only used for exit, or there might be occasion when it would be desirable to use it for an entrance. The superintendent's residence is placed exactly in centre of front block, and has a good, well-lighted staircase, approaching the private rooms from the first-class men's corridor. In the basement are kitchen and offices. The superintendent's office is on ground floor. On the first floor is a sitting-room with bay window, and a bedroom (or second sitting-room if desired) of similar size, a w.c., housemaid's sink, and store-room. On the second floor are two good bedrooms, and a servant's bedroom and box-room. It will be observed that the rooms of the residence are conveniently situated, easy of access, and well lighted, and the central position gives complete supervision over all parts. There is a separate entrance for tradesmen to basement provided for delivery of goods, &c. To the rear of the third-class swimming-bath is placed the boiler-house, with provision for heating "at least one of the swimming-baths" as required, but the authors have provided for space and power to heat more than this without difficulty should it be required. A washhouse, with the necessary hand machinery, is provided, with a sufficiency of drying-horses heated by steam from the boilers. A large coal store, with boiler-house yard and laundry yard walled in, are also shown. The materials proposed to be used are local red bricks for the general walling. The fronts to be faced with pressed red bricks, and the dressings, mouldings, &c., of red Corsehill or other approved stone. The walls of swimming-bath would be pointed. The swimming-baths would all be lined with glazed bricks set in cement below the water-line. The curb all round baths would be grey York stone, and the floors in front of boxes laid with tiles. The private baths would have fireproof floors laid with tiles and tiled dadoes. The floors of all corridors would be of hard-pressed tiles. It was proposed to lay wood-block paving except to upper floors of house, which would be tongued boarding on joists. The roofs of two swimming-baths would be wrought iron with cast-iron struts, &c., and covered with slates and boarded on inside. The heating for at least one swimming-bath and private baths is proposed to be effected by two boilers placed in position in boiler-house. These would be 16ft. long by 5ft. diameter, Lancashire boilers, with Galloway tubes and all latest improvements. Each boiler arranged to work steam or hot water. Water in the swimming-bath would be heated by a pipe taken direct from the boiler to the shallow end of bath, with a branch to the deep end, also entering boiler. Boilers arranged with two valves so as to work steam or hot water as required. The hot-water supply to private baths, &c., would be by a super-heater heated by steam, and a cold-water tank in the reof would be provided in connection with this, containing about 5,000 gallons. The baths would be porcelain for the first class, enamelled iron for second class. The swimming baths would be ventilated through skylights in roof, the side lights of which would be able to be opened at will as much as desired by a lever in bath-house, and also by side ventilators, as shown. The smaller rooms, private baths, &c., would have inlet ventilators and outlet ones for exhaust, on Boyle's or other approved principle. As regards estimate, the authors were satisfied that their design could be carried out in a good substantial manner, including the engineer's works and fittings, &c., complete, for about the sum of £13,000.

◆

CHIPS.

In an action brought on Tuesday by a working builder named Ford, living and carrying on business in Torrington-mews, against Messrs. Shoolbred, of Tottenham Court-road, £150 was recovered as damages for injuries to the head sustained by plaintiff's son, aged four, alleged to have been caused by the negligent driving of a van by one of defendants' men.

The committee for the restoration of St. Mary's Church, Warwick, decided on Tuesday to adopt the report of Mr. J. A. Chatwin, the architect, for taking down the galleries and removing the organ at a cost of about £3,000.

On Tuesday morning an accident—so far attended without loss of life—occurred on the Overhead Railway at Liverpool. A scaffolding, on which some 17 men were working, at a recently-erected bowstring bridge, which crosses the approach to the Landing-stage, suddenly collapsed. The men were precipitated to the ground, and twelve of them were more or less seriously injured.

An inquiry was held at the local board offices, Watford, on Friday, before Colonel Luard, R.E., one of the Local Government Board inspectors, into an application by the local board for permission to borrow £3,000 for works of water supply, £700 for street improvement, £300 for furnishing their offices, and for consent to apply the unexpended balance of a loan of £2,000 raised by them for works of sewerage to the execution of works of water supply.

At a meeting on Saturday of the Shropshire County Council, Mr. Alfred H. Carrell, district surveyor to the Norfolk County Council, and Mr. Henry John Hawkins, surveyor to the Stratton Highway Board, North Cornwall, were appointed divisional surveyors to superintend the main roads of the county.

COMPETITIONS.

Aston Manor, Birmingham.—Proposed Technical School.—At a meeting of the general committee of the above, held on the 29th ult., the designs under *nom de plume* "Science and Art" were accepted, and the author of them, Mr. Geo. H. Cox, of Birmingham, was appointed architect for the new buildings.

Beaumaris Pier. — The town council received, on Tuesday, designs for the proposed new promenade pier submitted by A. Sutter, C.E., Edinburgh; C. H. Beloe, C.E., Liverpool; T. Geddes, Leytonstone; J. Gillespie, Darlington; W. Gregory, Cheltenham; G. Ramage, Glasgow; R. Lethbridge, Tapscott; A. Steadman, Manchester; R. G. Thomas, Menai Bridge; C. P. Fowler, Preston; C. F. Bamford, C.E., Liverpool; Mayoh Bros., Manchester. A sub-committee was appointed to examine and select a plan, and to report to a special meeting on the 16th inst.

Birmingham General Hospital. — Mr. Alfred Waterhouse, R.A., the assessor in this competition, commenced the examination, on Monday, of the eleven sets of plans sent in, which are hung in the mayor's drawing-room at the council-house. The hospital is to accommodate 117 medical and 156 surgical in-patients of the ordinary class, besides 31 beds for special cases, making a total of 304. The full-sized wards are to contain 24 beds each. It is required that the out-patient departments shall be separate from the in-patients except for a communicating corridor, but that there shall be but one entrance. For the out-patients a central waiting-room is needed capable of seating 400 people, with casualty rooms, consulting rooms, and a dispensary suitably disposed in connection with it. In addition to the foregoing, provision has to be made for the various administration offices, for a lecture theatre, and domestic accommodation for the resident staff, which, including 80 nurses, extends to nearly 130 persons. The estimate of cost suggested by the committee is £80,000. All the competing architects have concurred in pointing out that a larger sum of money will be needed to provide the requirements than this estimate. Some of the designs, in an endeavour to keep within the stipulated sum, are so severely treated as to be suggestive rather of a workhouse or barracks than of a hospital. The whole of the designs are for brick buildings, with either red or buff terra-cotta dressings. The Queen Anne style, or some modification of it, is adopted by the majority of competing architects, evidently, the *Birmingham Post* suggests, for the reason that this style affords a façade in which large square windows, embellished by very simple mouldings, are a predominating feature. The site of the new hospital is almost square, having frontages to Steelhouse-lane on the south-east, to the Weaman-row side of St. Mary's-square on the north-west, while Whittall-street and Loveday-street will be the boundaries on the two other sides. Most of the designs show an administrative block and out-patient department fronting to Steelhouse-lane, and a long main communication from Loveday-street to Whittall-street, with wings projecting to the right and left of it, either opposite to one another or alternating, first a wing to the left and then one to the right. The wings, in some instances four in number, terminating towards St. Mary's-square, are treated more or less picturesquely. In several designs two of the wards on the St. Mary's-square side are circular or oval, the object being to secure as much sunlight as possible. In all the designs most of the buildings are in three stories, giving wards on the ground and first floors, with domestic accommodation on the second floor. In the administrative block, however, a larger number of floors is shown in many designs. One design is worked out so as to harmonise in style with the Victoria Courts, and another design is Scottish Gothic in character.

Shrewsbury.—The battle over the plans for the new police-station was resumed at a recent special meeeing of the town council, when a vigorous attempt was made to reopen the whole question with the view of obtaining for one of the competing and unsuccessful architects a chance of amending his plans in accordance with the requirements of the council. This was urged on the plea that there had been some dubiety in the decision of the professional umpire, as well as some misapprehension as to what the council had really desired from the architects competing, but an overwhelming majority, averse to any reversal of a preceding resolution, again decided the issue in favour of "Well Considered" (Mr. John Johnson, Queen Victoria-street, E.C.), who was further appointed architect for the new buildings, subject to the approval of the Home Secretary. The discussion was interspersed with indirect attacks upon the council's choice of a site, but the decision to build in Scotland-yard, College-hill, was adhered to.

Sunderland Lunatic Asylum.—In this competition it transpires that the authors of the design which received the second premium are Messrs. Hine and Odgers, of Plymouth, whose motto was "Turpi Sincernis Honestum." As we stated last week, the town council, on the recommendation of Mr. C. H. Howell, the referee, awarded the first premium to Mr. G. T. Hine, of Westminster, and the third to Messrs. Giles, Gough, and Trollope, of Charing Cross.

Wandsworth.—The Asylums Committee of the Middlesex County Council have advised the adoption of the design by Messrs. Stock, Page, and Stock, of London Bridge, for the new idiot annexe, near Tooting. The cost of the buildings will be from £30,000 to £40,000. There were six competitors invited who sent in plans. Further consideration of the matter is postponed till the next council meeting.

◆

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Architectual Association.—This association visited, on Saturday afternoon, St. Nicholas' Church, Dalkeith. Mr. Hippolyte J. Blanc, who conducted the party, described it to be one of the collegiate churches, so many of which were founded in Scotland during the 15th century. A few were erected at the end of the 14th century, of which he noted that at Dalkeith as one. Mr. Blanc traced the various changes which the fabric had undergone, explaining in detail the characteristic features in the door, windows, and buttresses. He also illustrated his exposition by a series of drawings prepared from measurements of several other collegiate churches built during the 15th century, and which all show the characteristic detail found at St. Nicholas'. The party subsequently proceeded to Newbattle Abbey. Mr. Archibald Macpherson acted as leader. The abbey stands on a site of a Cistertian monastery founded by David, 1140. The excavations made by the directions of Lord Lothian several years ago exposed the foundations of the church and some remains of the walls of the conventual residence. The church which measured 239ft. by 57ft., consisted of nave with aisles, short transepts, and square-ended apse. Newbattle was burnt by Richard II. of England, but was restored in the 14th century. The party afterwards visited the mansion house.

Leeds and Yorkshire Architectural Society.—On Monday Mr. A. Beresford Pite, F.R.I.B.A., of London, read a paper on "The Architecture of Michael Angelo." After describing the early life and training of the great architect, sculptor, and painter, the lecturer said Michael Angelo did not undertake architecture until he was forty years of age. He was born in 1474, and died in 1563, at the age of 90 years, having spent 70 years in working. He was the contemporary of Raphael, Bramante, and St. Gallo, who all died before he had begun his work at St. Peter's. Bramante began St. Peter's in 1502, and Michael Angelo followed him in 1540. The church was not completed till the next century. His work was characterised by great originality, breadth of treatment, majestic form, and vast scale. He was a dangerous example to weak men, but stimulated with enthusiasm any who desired to emulate his originality. His artistic life was a trouble to him on account of the rivalry of his friends, as well as jealous foes. Some of the best of his work was done for the Medici family, for whom he built the celebrated tomb at Florence. It was under the patronage of this family, as Popes, that he was employed at St. Peter's.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minumum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—O. S. R.—M. T. P. Co.—Oliver.—J. G. W.—N. and T. S. Co.—Semper Fidelis.—B. T. and Co.

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"Ich Dien," "H" in a circle, "Excelsior," "Yorkshire Tradition," "Nobut-a-yun-un," "Gargoyle," "Wyandotte," "Ilex," "Van Demon," "Glencoe," "Tyro," "Unitate Fortior," "Point Dexter," "B" in a circle," "Excelsior" (Oldham), "Westward Ho," "Cruiser," "The Idler," "La Cigale," "Jap," "Hardwick," "Smilash the Goth," "Phœnix," "McGinty," "Signor C," "Boreas," "Ray" (we cannot undertake to return any particular roller), "Compass Box," "Toiler of the Sea," "Baluster," "G" in a circle," "Norman," "Red Lion," and "Flute."—For Cottages: "Jean" (too late), "Sweet Auburn" (ditto).—For Post-office: "Alphal," "Vulcan" (your drawing was received).

Correspondence.

REGISTRATION WANTED.

To the Editor of the Building News.

Sir,—In your issue of the 26th Feb. a letter appeared under above heading. As a provincial architect in a good position, I trust you will allow me to suggest that the present state of things in the profession is a disgrace to every architect, and unless the social position of architects is to rank somewhere on a level with those who adopt the title of architect, something must quickly be done. If the R.I.B.A. is to rank as a "select London Club," all well and good; *if not*, it is their duty to help us in this matter to obtain Registration. This latter is the most important matter that has ever been brought forward since the Institute had their Charter, yet they not only stopped the Registration Bill, but refuse to give us anything in its place, thereby deserving little support at the hands of any provincial architects. A provincial F.R.I.B.A. told me, only a few weeks ago, that "in his town there is a sweep whose name and trades appear as 'Sweep and architect' over his door." I know in my own town of several carpenters, builders, &c., several of whom can hardly sign their own names, practising as architects, and their name appearing as such on buildings they "drew out plans" for—the latter they obtain from books, and *design* (?) elevations to fit these, ignoring all the laws of design and construction, heavy brick and stone parapets surmounting wooden oriels, &c., gables being finished with "*ornaments*" in wood or cement, which I can only compare to "distorted looking-glasses," independent of the injury done to "*other*" architects. I studied architecture, from an artist's point of view, in John Ruskin's drawing school, and I am sure such buildings tend greatly to deprave the public taste, and are perpetual monuments of disgrace to our leading architectural bodies, and practically an *everlasting* annoyance to the eyes of every educated Englishman. Surely our R.I.B.A. cannot be wilfully blind to this sort of thing? They have done nothing, however, to lessen and prevent future competition from carpenters, sweeps, jerry builders, &c., practising as architects. I recollect Mr. Cates once saying "that tradesmen and the public generally would soon learn to appreciate the qualification of members of the Institute," and this would check such people practising. This is theory only, and "won't work." I have seen far more of provincial practice than Mr. Cates, and I maintain that tradespeople and the middle-class general public will continue to do as their fathers did before them, and go to the cheapest market for their plans, as they do for their goods. Registration is necessary, if only to protect such people "*against themselves*," and is equally necessary for architects as for lawyers and doctors. In conclusion, I shall be only too pleased to subscribe towards a fund to help procure Registration, and I am sure my brother provincial architects will do the same; if they do not agitate and combine for their own interests, be sure no one else will.—I am, &c.,

Feb. 27. S.

BLACKBURN NEW PAUPER LUNATIC ASYLUM COMPETITION.

Sir,—On the 31st October, 1891, instructions to architects practising and having offices in Blackburn were issued by the town clerk for the above competition. In clause 10 are the following words:—

"Each set of plans and drawings and description must be marked by a motto or device which has not been previously used by the competitor, and be accompanied by a sealed envelope, bearing the same motto or device, and containing the name and address."

On the 29th February (the day for sending in the designs) the borough surveyor sent one of his assistants round to the various architects in the town to ascertain the size and number of the framed drawings they were that day sending in, ostensibly that he might get the packing-cases made for sending each competitors' drawings off to Mr. Hine, architect, Plymouth, on the following day, to be reported upon by him as referee. Now, Sir, as the size of the mounted drawings for such a large building is left to the discretion of each competitor, and will doubtless be of various sizes, is not this plan of the borough surveyor likely to prevent clause 10 being kept? We might just as well have added our respective names to the designs, for the measurement of the drawings being known to the borough surveyor would place it in his, or his assistants', power to disclose that which should be kept secret; and although we have no reason to think that all is not fair and above suspicion in the conduct of this competition, we would suggest that, in the interests of the eleven competing architects, also to prevent any suspicion of collusion between the referee and the borough officials, the designs should be sent on from Plymouth to the Local Government Board for their opinion as to which is the best before the Building Committee give their award.—I am, &c., A. Competitor.

WHAT IS SUPERINTENDENCE?

Sir,—Your leading article in this week's issue, headed "What is Superintendence?" points so directly to a case in which I am personally interested (Rogers *v.* James) that I hope you will excuse me for again intruding myself before your readers.

I need not traverse again the points of the case—they are so clearly rendered in your leading article; but I wish to reiterate your last paragraph, in which you say: "There should rtainly be issued by authority a clear and efinite statement of what architectural superntendence really ought to be. We commend ie matter to the attention of the societies which epresent the profession."

Allow me to say that I have placed this case efore the R.I.B.A., and I have been informed y their secretary that the council consider "it is ndesirable to take any action."

Perhaps now that attention has been called to he matter and its serious consequences to the rofession by your powerful pen, some more nfluential member will endeavour to do what I ave done ineffectually. My efforts to obtain ustice from Judge and jury have landed me in a rushing load of debt, which I can never hope to ecover.—I am, &c. FREDK. ROGERS.

29, Freelands-road, Bromley, Kent, March 1.

THE MINIMUM HEIGHT OF ROOMS.

SIR,—I was surprised to read in your issue of the 26th inst. the remarks made by Professor Banister Fletcher at a recent meeting of the Society of Architects, and his opposition to the proposed minimum height of rooms being raised from 7ft. to 8ft. Professor Fletcher said: "Surely to be logical the height should depend upon the size of the apartment and its purpose; the 8ft. minimum was mere arbitrary guess-work, unsupported by medical or scientific data, being merely theory and not practice." This language by Professor Fletcher may sound well in the ears of some people, but to me it does not appear to be based on either theory or practice. Let a room be ever so extensive in its floor, and the vitiated air will accumulate near the ceiling, and if proper means of ventilation is not adopted (which is hardly ever the case) will, in a short time, cause a room with a low ceiling to become extremely unhealthy. I have known myself hundreds of cases where bedrooms ranging (as many of them do) from 6ft. to 7ft. in height, have been the cause of generating typhoid and many other diseases, and as a result my own Board, whilst amending their building by-laws under the powers conferred upon them by the adoption of the Public Health Acts Amendment Act, 1890, have asked the Local Government Board to fix the minimum height of all habitable rooms at 8½ft. I am certainly of opinion that the fixing of a minimum height for habitable rooms is of far more importance than an unlimited floor area.—I am, &c.,

W. FRASER, A.M.I.C.E., &c.,
Surveyor City of Llandaff and Cardiff Union.
February 29.

DRAINAGE REGULATIONS.

SIR,—In your report of the meeting of the Society of Architects, held on Tuesday, the 23rd inst., I am made to say that there are no drainage regulations at "Holloway"; this should have been "Holborn."

Kindly insert this correction, as Holloway is in the district of Islington, I believe, where there are drainage regulations more or less efficient.—I am, &c., EDWARD TIDMAN.

Connaught Mansions, Victoria-street,
Westminster, S.W., Feb. 27.

◆

The guardians of the St. Olave's Union approved the designs for a new dispensary to be built in Bermondsey. The estimated cost of the building is £2,000, and the architects are Messrs. Newman and Newmam, of 31, Tooley-street, London Bridge.

The Oxford-street Schools, West Hartlepool, which were built two or three years since for about 600 children, are now found too small for the district. The board have, therefore, intrusted the architect, Mr. J. P. Pritchett, of Darlington, to carry out an upper grade school for about 500 more children on adjoining ground.

The Infectious Diseases Hospital, Norwich, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves with descending smoke-flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

Alterations have been made to Lloyd's Bank, Cardiff, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

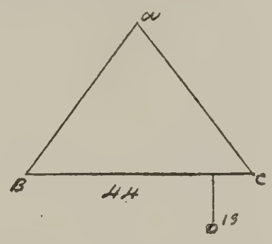
Mr. Silvanus Trevail, architect, of Truro, has just been returned unopposed as the representative in the Cornwall County Council for the Eastern Electoral Division of that city. Mr. Trevail's return in the first County Council for the same division was also unopposed.

Intercommunication.

QUESTIONS.

[10734.]—**Gothic Architecture.**—May we assume that the terms "Gothic architecture" and "Christian architecture" are synonymous; and may we take it as a fact that no Gothic architecture existed prior to the Christian era?—HENRY R. CLIFTON.

[10735.]—**Statics.**—A uniform beam, weight 44lb., is suspended at the point *a*, by two strings of equal length, from its extremities B and C. At the point D a weight of 13lb. is suspended. Determine the equilibrium of the beam. Will any reader explain the solution of this and similar problems?—ASPIRANT.



[10736.]—**Bridges.**—Will someone inform me what is the number of arches, with their span and height, supporting the stone bridge over the Tiber at Rome? Also the same particulars of the stone bridge over the Aire at Ferrybridge, Yorkshire.—R. A. H.

[10737.]—**Tenant's Fixtures.**—A tenant has erected during his term of 21 years' lease several buildings constructed of timber, and covered with corrugated iron, on a low brick foundation; in one case a school dormitory connected with the main building, and in another a chapel, attached to same by a corridor. I presume that both these erections would undoubtedly come under the head of Fixtures, and could not be removed by the tenant at the end of his lease. Am I right in my supposition?—H. E. W.

[10738.]—**Sheet Glass.**—Will someone kindly inform me how to detect the difference between (sheet-glass) a good quality of third, and a poor quality of second? Also, as sheet glass varies in thickness in one sheet, how can I tell what it should measure, or what it should weigh?—CHAS. PITTS.

REPLIES.

[10705.]—**Ventilation of Stables.**—If your correspondent in your issue of Jan. 22nd will communicate his address, we will forward him a copy of our "Notes on Stable Ventilation." We had intended replying to his question before, but have been prevented by press of other matters. There is, however, little in his proposed system of ventilation with which fault should be found. We are taking the opportunity of forwarding you one of our new stable catalogues.—HAYWARD BROTHERS AND ECKSTEIN, 187, Union-street, Borough, S.E.

[And a most useful and comprehensive catalogue it is—one which should be in the hands of all architects, builders, and others interested in this class of buildings and their fittings.—ED. B.N.]

◆

CHIPS.

Some damage was done by fire a year ago to St. Benet's Church, Paul's Wharf, used by the Welsh community, and the City Commissioners of Sewers, being dissatisfied with the work of restoration, erected a scaffolding round it. This was afterwards removed, but the Commissioners claimed to be recouped £51, the outlay upon the work. As this was refused, they threatened to sell the church. The dispute was brought on Friday before Mr. Justice Charles, who granted an injunction restraining the Commissioners from carrying out their threat.

The Dover corporation decided on Saturday to adopt a plan for street improvements in the borough, including a new drive from the rural part of the town on to the Marine-parade, opposite where the promenade pier is being constructed, and the widening of part of the main artery of the town. The cost of the work, which is part of a larger scheme, is set down at £40,000.

A new cottage hospital is about to be built at Willesden, from the designs of Messrs. Newman and Newman, of 31, Tooley-street, London Bridge. The accommodation to be at first provided is for nine beds, with the necessary offices; but the plans provide for the future extension of the building to accommodate eight males and eight females, with a separation ward.

A new parish room is to be built at Wormley, Herts, from the designs of Messrs. Newman and Newman, architects, of 31, Tooley-street, London Bridge.

Mr. Passmore Edwards has sent to the Rev. S. A. Barnett a cheque for £6,454, to defray the whole estimated cost of building the Whitechapel Free Library. The sum already received will pay for the site, the fittings, and the books, so that the whole amount of the rate will be available for working the library.

Legal.

LESSEES' LIABILITIES.

THE legal liabilities of a lessee are various and numerous, and when the property leased is situated in a crowded thoroughfare, and sublet to all sorts of tenants, these liabilities may seem to be very much increased. A lessee of a house having a cellar-flap opening on to or in the pavement of the highway, would, for instance, be responsible in damages for any accidents arising from its use, if it were in itself so dangerous as to be regarded in law as a nuisance. If, however, it were not in itself dangerous, then the lessee of the whole premises could not be made liable in damages for injury to a stranger arising from its use, unless negligence can be proved against him or his servants, and the person legally responsible would be any under-tenant using the cellar-flap negligently. This is of course, not a new point, but it was very well illustrated in the recent case of "De Boos v. Collards" (*Times*, 17th Feb.), which was an action in the Mayor's Court, London, wherein the plaintiff sued Collard's, of Cheapside, for injury to him while passing along the highway, caused by the sudden opening of a cellar-flap in front of their shop. It appeared that the defendants were lessees of the whole house, and they occupied the ground floor and back basement; but they did not occupy the front basement or cellar beneath, which were, in fact, used by some of their under-tenants of the other floors.

At the trial it was proved that the accident arose from the sudden opening upwards of the cellar-flap; but no evidence was given of it having been raised by any servant of the defendants, and, in fact, it appeared that they had not used the cellar for some years. An inspector of pavements was called to prove that the flap, if opened upwards without warning, would be dangerous to persons passing by at the time, which, indeed, is obvious enough; but he did not consider it dangerous in itself, or he would have interfered with it as a nuisance. On these facts defendants submitted that there was no case; but the judge holding there was, left it to the jury, who gave a verdict for plaintiff with £55 damages. This ruling a Divisional Court have now promptly reversed, on the ground that there was no evidence whatever of any negligence on the part of the defendants or of their servants, who, in fact, did not use the cellar or the flap. The Court also held that the flap was only dangerous when opened suddenly, and without warning, and so was not a nuisance for which the lessees of the whole premises could be made liable. At the same time, it must be admitted that these flaps opening upwards and outwards in the very footway of a crowded thoroughfare, are so dangerous as to need great care in their proper use, and it would be well if some better method could be devised, so as both to prevent accidents and save litigation.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

INQUIRER.—SHOP FRONT.—LIGHTS.—I do not see that A can in any way prevent B from putting up the shop-front as stated in the plan. But probably the consent of the local authority would first have to be obtained. As to A's right of light in end shop-window, it does not appear to have been opened for 20 years. Even if it has, moreover, it is not a real front light at all, and could hardly be reduced by B's building. If there is anything in this point, it could be got over by B's putting glass window here instead of wall.

W. E. D.—CARRIAGE OF GOODS.—OWNER'S RISK.—Something may depend on the form of the risk note signed. But, broadly speaking, a railway company can contract itself out of all liability for damage caused by negligence, short of such gross and obvious negligence as amounts to misconduct on the part of their servants. In this case, the fact showing how and where the damage was done, would practically decide the issue.

H.—ANCIENT LIGHTS.—NOTICE.—It does not appear to me that the outbuilding erected by A does, in a legal sense, substantially reduce B's light and air. Then there is the difficulty that B bought his house with notice of A's building, which was put up some time before, and so I see no ground for action.

A. B.—LOAN SOCIETY.—Yes; each surety is liable for the whole loan, and they can proceed against you—leaving you to get back what you can from the other sureties or from the principal debtor.

LEGAL INTELLIGENCE.

Damages against a Building Firm.—On Monday, the 22nd Feb., a jury case, of interest to the trade, was heard at Bow County Court, before Judge Prentice, under the Employers' Liability Act, by which Charles Phillips, labourer, of 7, Croydon-road, Plaistow, sought to recover £100 from Messrs. Atherton and Latta, builders and contractors, for injuries sustained through defective plant. On November 28th last plaintiff was engaged at buildings in course of erection in Farringdon-street. He assisted in lifting granite blocks on to rollers by an automatic jack. After two had been lifted 10in. in height, the jack would not descend, in consequence of the thumbscrew being out of order. On resuming work next morning, plaintiff called the attention of the foreman, Thomas, to the jack, who replied, "Do the best you can; if we send the jack to Manchester, it will be three weeks before we get it back, and the work must be hurried on." In consequence, plaintiff put a quantity of wooden padding between the rollers and the jack, and raised the jack a second 10in., when it suddenly came down, the wooden padding struck plaintiff, who was a yard and a half distant from the jack, violently on the right leg, and fractured the main bone in two places. He was removed to St. Bartholomew's Hospital, where he was an in-patient for seven weeks, and was still an out-patient. He earned 35s. per week. Plaintiff's statement was corroborated by three of his fellow workmen. For the defence, it was contended that the accident was the result of plaintiff's own negligence, but no evidence was called. The jury returned a verdict for plaintiff for £50, and his honour certified for costs.

Extra Work. — A difference having arisen between the contractors, Messrs. Staines and Son, and the owners of some buildings in Marylebone, the matter was referred to Mr. Henry Currey, and after a careful investigation of the facts, he made an award giving the builders a very small sum over the amount offered, and condemning them to pay four-fifths of the costs. Messrs. Franklin and Andrews were surveyors for the plaintiffs, and Mr. Henry Lovegrove was surveyor for the defendants.

Surveyor's Fee for Negotiating Purchase.—This was an action in the Mayor's Court, Guildhall, brought by Mr. Henry Lovegrove, of 26, Budge-row, City, against Messrs. Truman, Hanbury, and Co., the well-known brewers. Mr. Lewis Glyn (in the unavoidable absence of Mr. Edward Boyle), instructed by Messrs. Angrove and Bromwich, appeared for the plaintiff, and Mr. Paul Taylor, instructed by Messrs. Hawbury, Hutton, and Whitting, appeared for the defendants. Mr. Lovegrove stated that in the autumn of 1889 he was acting for the defendants' lessees in Fetter-lane, and when at the brewery on a day in November of that year the acquirement of an adjoining slip of land was discussed, and Mr. Fraser requested the plaintiff to try to purchase the property. After this, for some weeks, the plaintiff was in communication with the vendors, and eventually purchased the land conditionally on giving up some rights of light. The defendants' evidence proved that such an interview took place; but they considered that plaintiff was acting on behalf of their tenant. The judge, in summing up, pointed out that the land was conveyed to the defendants, and afterwards sold by them, and it was evident that the plaintiff, and nobody else, had arranged the matter. The jury gave a verdict for the plaintiff for the amount claimed and costs.
